The Henyard.

Patent on Hovers.

Can you tell me if I have or have not the right to make a homemade chick brooder or hover using the hot air for heat, or do the patents on them prevent me? O.

New York.

There can be no valid patent upon the prineiple of using hot water or air in brooders. All poultrymen have been doing it for years, and one of the chief joys in the amateur's life is to devise some new scheme for keeping the chicks warm. Standing upon the head in the rain, trying to light a smoky lamp, is the joyous prerogative of all poultrymen, and none need make them afraid. M. B. D.

Day-old Chicks.

Are day-old chickens as full of vitality if not shipped too long distances, as those raised under hens and reared where hatched? In other words, can I safely buy day-old chicks up North, have them shipped here and expect to have them mature into as vigorous adults as those hatched right here on the plaee?

Salem, Va. J. E. W.

There is no doubt that a chicken, hatched and reared without being shipped to a distance, has some slight advantage over one that has been subjected to the vicissitudes of a railroad journey; but it must be remembered that there is a difference in "day-old chicks." Chickens well hatched from vigorous stock, free from disease or other conditions that tend to lowered vitality, will live and thrive, whether shipped or not, when weaklings would either die or mature into inferior fowls. Perhaps the greatest advantage in home hatching is in the opportunity it affords to know the conditions under which the chicks were produced. So far as the shipping alone is concerned, day-old chicks are successfully sent to very considerable distances without obvious detriment. M. B. D.

Deformed Pullets.

A day or two ago I culled from my White Leghorn pullets all deformed ones, and put them in a pen by themselves. Later on giving them a pan of feed, I had the sensation of one when dizzy, and his head begins to swim. However, I knew that I felt all right, and on observing more closely I noticed that the tails of these crooked-backed pullets all turned to the left, and as they circled around the pen, the slant of their tails carried the eye round and round the feeding group. I now wondered if this was a coincidence that these dozen or more tails all turned to the left. I then went to a pen of R. I. Red cockerels where there were several deformed, here I found all tails turned to the left. My interest now well aroused, I went over all my flocks, and found only one exception in twisted tails. This was a White Orpington which carried her tail with a very slight tendency to the right.

Massachusetts. F. E. P.

I confess that I do not know whether the majority of twisted tails veer to the right or left; your own observations are the only ones that I have ever noted upon the subject. It may be more than coincidence. I suppose that deformities are not strictly hereditary, but are due to improper development of the embryo, and this, in turn, to various conditions, such as lack of vitality in breeding stock, improper temperatures during the hatching, and possibly, also, to hereditary transmission of tendency to certain malformations. M. B. D.

Colds or Roup.

Explain the difference between colds and roup in fowls. Two of my P. Rocks had a bad odor in the head and I used the ax to be on the safe side. A. S.

Woodbury Falls, N. Y.

Ordinary "colds" in fowls are marked by about the same symptoms that humans display under the same circumstances. The fowls sneeze, their eyes and nostrils run, the breathing is more or less obstructed, they act dull and generally uncomfortable. Now if these symptoms all become aggravated, the discharge from eyes and nostrils instead of remaining thin and watery become thick and purulent, cheesy masses form about the eyes, sometimes displacing the eyeball, the discharges take on a fœtid color, the fowl loses appetite and becomes droopy, the feathers ruffled, and marked weakness supervenes, it is fair to conclude that the germs of true roup are present, either developing the original trouble or being added to it because of the favorable ground which the catarrhal cold afforded them. As a practical precaution, fowls showing evidences of a cold should be removed from the flock, and permanganate of potassium should be given in the drinking water of both sick and healthy fowls. If instead of recovering, the symptoms become aggravated, as described above, particularly if a markedly fœtid odor appears, the affected fowls should be killed and buried. Technically, the difference between colds and roup is probably that in the latter disease there is a specific germ present that is not present in the former, or at least if it be present, the resistance of the fowl's tissues is such that it cannot develop its malignancy. M. B. D.

Poor Laying.

I have a flock of 60 one and two-year-old Barred Rocks; am getting about 17 eggs a day now, January average nine. What changes would you make in the following method of feeding? I have only small space to use as scratch pen with deep litter; feed as follows: Morning three quarts whole oats in litter, five quarts wet mash. Noon feed four quarts wet mash, with beets or turnips every other day. Four o'clock six quarts wet mash and just before dark all the cracked corn they will eat. Mash mixture 200 pounds ground oats, 200 pounds wheat bran, 100 pounds each cornmeal, gluten, middlings, best grade dried meat scrap. Also feed plenty of grit, shells and charcoal. L. E. H.

Pennsylvania.

Your plan is all right if you wish to go to the trouble of mixing wet mash for your hens three times per day, and are careful not to overfeed of it so that the hens do not have a proper proportion of whole grain. Most poultrymen do not care to mix mash for the fowls more than once a day, and this usually either in the morning or at noon, preferably the latter. I would not use a wet mash at all, but would give this to them dry, in a hopper, open to them all day. I should then mix the corn and oats, add some wheat and buckwheat, and feed the mixed grain in the litter, morning and night. This is the approved method of feeding used by the majority of poultrymen, but it is not the only method that will bring good results, and yours may be satisfactory to you. M. B. D.

Feeding Sour Milk.

Tell us how the so-called "sour-milk pen" of Leghorns at Storrs is fed. That is, how do they feed the sour milk? Is it fed by itself or in a mash? If it is fed alone is it allowed to become very thick before feeding? I have found in feeding milk that the birds get it all over their feathers. To avoid this I have fed sour milk in a mash or porridge. I want to feed it to baby chicks this coming Spring, but I should like to know what sort of a utensil to put it in, so they won't get it all over themselves. G. B.

Westport, Conn.

The feeding of sour milk to little chicks does result in sticky feathers, for they do get themselves daubed up with it unless prevented from doing so. At Storrs College they accomplished this by feeding the milk in circular granite ware cake pans about two inches deep, then on top of this a piece of wire netting was placed and the edges bent down at the corners so the chicks could not get it off. Then the chicks could dip their heads through the wire and get the milk without wetting themselves. If sweet milk was put in the pans, it soon became thick—"loppered"—and in this condition was eaten much more readily by the chicks. They preferred to eat it rather than to drink it. For hens they are using "over-all" feeders; these are heavy porcelain, very easily cleaned, and are heavy enough to stand without tipping over if a hen gets on the edge of it. The hens do not get the milk on their feathers, or not enough to do any harm.

GEO. A. COSGROVE.

We cook the Colic out of Chick-Feed

The steam-cooking we give H-O Steam-Cooked Chick Feed at our mills opens up all the grain cells, perfectly preparing the nutriment for the chick's stomach.

H-O Steam-Cooked Chick Feed helps to keep the death-rate low. Try it and you'll have better luck with your next brood.

H-O Steam-Cooked Chick-Feed

is a scientific mixture of Corn, Cut-Oatmeal, Cracked Wheat, Kaffir Corn, Peas and Millet—*steam-cooked* by a special process in our mill.

Sold only in 10-lb., 25-lb., 50-lb. and 100-lb. bags, with tag showing guaranteed analysis. If you cannot get H-O Steam-Cooked Chick Feed, Intermediate Scratch, Scratch Feed, Poultry Feed, Dry Poultry Mash or Chick Feed from your dealer, write for sample and prices.

The Henyard.

Leghorns in the Gulf States.

I note Mr. Cosgrove states the Leghorns had laid off, and asks if anyone can answer. I cannot say that I can answer, but may help. Some years ago when figuring on the proposition of breeding chickens for fancy trade and on getting into egg production for market, I wrote one of the best known and most successful poultry men in this section of Mississippi. He was breeding Leghorns for utility and show, also Wyandottes. I told him what I wanted to know, and asked about the Leghorn as an egg producer. He supplied the information asked for, and advised against the Leghorn, recommending the Wyandotte, which he had and the Barred Rock, which he did not breed, as better egg breeds, for the reason that they produced in Winter, while Leghorns did not with any certainty, which fact the contests have proven correct. He further said that aside from poor Winter laying, the Leghorn was unfavorably influenced by any extremely hot, sultry, or foggy weather and by rainy spells of several days or more duration; that such weather had an almost immediate effect on them, and he could only recommend them for situations where such conditions did not exist often. He did not look on them as reliable egg producers near the Gulf.

Without knowing what the weather conditions were during the time spoken of, I venture to say there was much humidity in the air, and it was probably that which did the work in knocking down the record. I have had Leghorns, and found them an unsatisfactory chicken for egg production as compared with Rocks in this locality, and subject to weather conditions. I am not prejudiced against the Leghorn as a breed, but found them an unprofitable proposition and got rid of them, for the old saying of "Fair weather friends are not worth much" about expresses them. M. A. P.

Alabama.

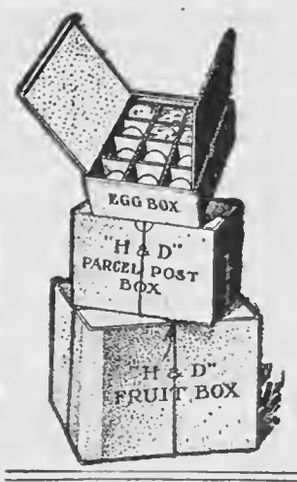
R. N.-Y.—We welcome any good natured discussion of breeds. There can be nothing to fight about if some other breeder honestly thinks he has something better than you have. Last year's contest certainly showed the Leghorns to be fine Winter layers. Most of the birds sent up from the South seem to be of the larger breeds.

Late Molting.

I put up in the Fall 1,380 pullets in one house and 440 in another; the large bunch were all combed up nicely and went to laying very soon after they were housed November 6, and laid 30% during December, but have steadily gone into a molt and decreased to a 15 percent lay now. The small bunch were the small and late-developed pullets, but were not a bad lot by any means. They began to lay about three weeks after the other bunch started and laid 25 per cent during December and January. These pullets were all fed alike, wheat in the litter in the morning and up to December 10 they were given turnips and the tops, cabbage, or rape for their green feed and then I had to fall back on ground Alfalfa scalded. Corn was fed in the evening in the litter. Beef was boiled and fed in very rich mash made by thickening the soup which was almost half meat, to a very stiff dough with cornmeal, bran and Alfalfa meal, this was liberally sprinkled with cayenne pepper. This mash was fed warm in the evening in place of the corn. They were all fed about all that they would clean up in about 10 minutes. I have been feeding this way for years with good results with the exception of the meat mash. I believe that had my pullets been put up earlier they would have laid well all through the last of October and November, but was unable to do this

West Virginia. A. F. M.

It is a fact well known by poultrymen that early pullets that are meat fed and pushed to quick maturity are liable to begin laying early, and after having laid out a clutch of eggs, to molt. The remedy for this is to refrain from quite so early hatching or to keep stimulating meat food from them when they begin to show signs of premature development. You do not say when your pullets were hatched or how they were fed, but from the fact that they began to lay early, I take it that they were early hatched and pushed rapidly along to maturity, thus predisposing them to a premature molt. The addition of a rich meat ration in December probably finished the job of overstimulating them, and molting followed. This is liable to occur any year, but from the reports I get from poultrymen in different parts of the country, I judge that this unfortunate condition has been more than ordinarily prevalent this season. Some of the pens of pullets entered in the Storrs laying contest have gone into molt and nearly, or quite, stopped laying. I know of nothing that can be done now except to grin and bear it; you can have whatever satisfaction there may be in knowing that others are having the same trouble, and another season, you will guard against premature "ripening" of your pullets by feeding less meat and more corn if you see by the rapidity of their development that they are becoming hens too early. M. B. D.



SHIP BY PARCEL POST IN STRONG, LIGHT "H & D" BOXES
"H & D" Boxes are designed to carry farm products by Parcel Post. They meet all requirements of new regulations and *guarantee safe delivery.* Made of double-faced, corrugated Jute board—a perfect cushion for eggs and other fragile articles—protects from heat and cold. Waterproof, sanitary, light, firm and strong. Shipped knocked-down, easy to set up and pack.

Farm Management.

COST OF AN APPLE ORCHARD TO BEARING AGE.

PART III.

SUMMARY.—To summarize briefly, this orchard has still at the end of the eleventh year to return $157 an acre or $2.50 per tree before it can begin to show a profit. But it should be remembered that five per cent. interest on the investment and all labor has been paid each year. The showing in Orchard C is much more favorable. This is due to a better plan and to better methods of management. Four continuous crops of beans, one of our best cash crops, were grown in the orchard. The fillers were peaches instead of plums (the soil did not permit of peaches being grown in Orchard A, but pears could have been grown and these would doubtless have proved more profitable). As the apple trees have not yet come to the bearing age, we will consider the cost of the orchard from the standpoint of the peach trees. Approximately there are three peach trees to each apple tree. The total cost of growing to four years of age when the peach trees began to make a net return over the current cost of operation, was $106.35 an acre or $1 a tree. Nineteen dollars and thirty-six cents an acre or 18 cents a tree—18 per cent.—of this amount was labor. Interest amounted to 28 per cent. of the total cost, and management to 18 per cent. The four crops of beans grown between the tree rows reduced this total cost just one-half. A small crop of peaches in the fourth season took off $9.21 an acre or nine cents a tree more, bringing the net total cost at four years of age down to $43.73 an acre or 41 cents a tree. The crop of peaches in the fifth year netted enough to a little more than pay up the entire cost of the orchard. To summarize briefly the results in Orchard C at six years of age, enough has been obtained from the land not only to pay the entire cost of the orchard for the period but to give an average annual net return of $9.36 an acre (this is nearly twice the average net return from field crops) or 8½ cents a tree. And with this total net profit of $59.19 an acre, the peach trees are just at their prime, and the apple trees half through the non-bearing period.

CONCLUSIONS.—The costs of growing orchards to bearing ages are almost entirely a question of plan and management. With a wise plan well executed costs may be kept down to nominal figures. Plans which do not fit conditions and poor management may result in such excessive costs that profits will be long delayed, if not made impossible. My own experience teaches me that under my own conditions, enough products may be obtained in an apple orchard, both from tree fillers and from crops between the tree rows, to pay the entire cost of the orchard at 10 years of age, except perhaps the profit lost from crops which might have been grown in place of the orchard. In my own case this has amounted to about $5 an acre annually or about $50 for the period. But lack of experience and none too good management has made one apple orchard cost me $8 a tree at 10 years of age, besides losing the use of the land for this period. Experience has also taught me that under my own conditions a peach orchard should be made to pay for itself at the end of the fifth or sixth year, leaving the net return above the cost of operation as a profit to be distributed over the life period of the orchard. This should easily amount to $10 an acre a year for about 12 to 15 years or twice the average annual net return for field crops on my own farm.

While the cost of growing trees varies directly with the conditions of soil, typography, markets, management, etc., every grower is competing with every other grower and every region with every other region. The man who can grow his trees the cheapest and produce his fruit at the lowest cost has the advantage. Most of us do not know what our trees or our fruit costs us. If we did, we could see how we might reduce our costs and we would be likely to become more conservative in our business. Speculation would be reduced to a minimum. Hence the great need of keeping records. Competition will in the end eliminate the orchardist who does not know his business and his costs of production and the man whose costs are too high.

In determining the costs of growing orchards, we should be careful to include every item of expense. Labor, though important, is often a comparatively small part of the expense. In my own case it amounted to only 18 and 20 per cent. Interest on the other hand, made up 42 per cent. of the cost of one orchard and 28 per cent. on another. The cost of management amounted to 18 and 24 per cent. The costs of equipment, of the use of buildings, of taxes, interest, overhead and management costs, all or some of which are usually omitted in calculating costs, amounted to 69 per cent. of the total in one of my orchards and to 60 per cent. in the other.

My experience leads me to believe that on an average, the net profits from orchards during their entire lifetime do not greatly exceed the net returns from ordinary field crops. The net returns from an orchard in any one year are misleading. Accurate records on orchards for their entire lifetime are very much needed, in order to avoid false ideas of profits and to steady land values.

Under good management, however, my experience has also shown that orchards may be made to pay double the profits which can be obtained from field crops over a period equal to the lifetime of the orchard. As in all other lines of business, the profitableness of orcharding depends upon a wise plan formed from experience, properly interpreted, and upon good judgment in the execution of the plan. Careful records check up and make definite loose experiences and tend to make ones judgment sound.

M. C. BURRITT.

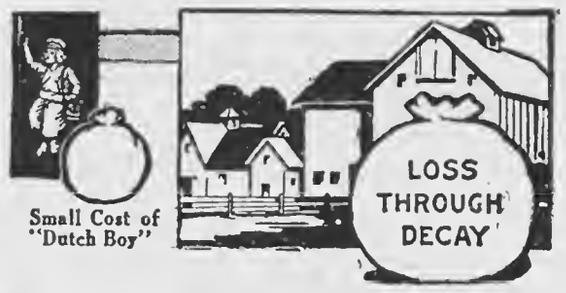
Stocking a Fish Pond.

What kind of fish is best to put in a pond fed by a spring brook? It has some small minnows, was once a trout brook, but is minus trout now. I have dammed the brook and it covers an acre or more, is from four to eight feet deep. I was thinking of stocking it with Wall-eyed pike, or would crappies or bullheads be better suited to a place of this kind?

North End, Pa. A. L. E.

I would suggest bullheads, Yellow perch or crappie. The pond is not deep or large enough for Wall-eyed pike. The bullhead is the best for a food fish.

J. A.



Small Paint Costs Save Big Farm Costs

Heavy farm repairs saved! How? By protecting houses, barns, farm vehicles from rain rot and sun blister. With a free use of

Dutch Boy White Lead

mixed with Dutch Boy linseed oil you will not have to patronize the lumber yard and the carpenter so often. The small expenditure saves the big one. Can be tinted any color. Red lead—best for implements and metal—comes in paste form, too. Doesn't harden in the can. Ask your dealer.

IT was Robert's first visit to the Zoo. "What do you think of the animals?" inquired Uncle Ben. After a critical inspection of the exhibit the boy replied: "I should think the kangaroo and the elephant should change tails."—Youngstown Telegram.

PRODUCTS, PRICES AND TRADE.

Wholesale milk prices at New York remain as previously reported, $1.81 and $1.71, covering considerable of the business.

*

The New York butter market is dull and two cents lower than last week. At this writing 28 cents is the top for creamery, with the probability of a further drop. Storage is being offered urgently at 25 to 27 cents for good grades, and State dairy, 24 to 26.

*

Egg receipts are running heavy, but trade is good. Prices run about the same as last week on most grades, but fancy whites are a cent lower, 32 cents being an extreme price. Some brown and mixed bring 30 to 31 cents, but a large amount of business is covered by a range of 27 to 29 cents.

*

The potato market at New York is weak and 25 to 35 cents per barrel lower, prices ranging from $1.75 to $2.50. A great many of the offerings run poor either in size or from frost damage. Idaho potatoes are selling well in the Central West. St. Louis alone expects to handle 30,000 bushels of the Idaho stock, which are of excellent quality. The wholesale price is about $1 per bushel now.

*

In a single week recently we shipped 375 tons of dressed chickens to England. They were grown and packed in the Middle West, and graded carefully, as to size and quality. Some of the standard sizes of boxes used for packing are: 12 roasters, running 4 to 4½ pounds each, 8x16x19, inside measurement; 12 frying chickens, 2 to 2½ pounds each, 4¾x19x21; 12 small fowls, 3 to 3½ pounds each, 7x12½x14.

*

Iowa leads all States in value of live stock, $470,272,000, the horse industry being the most valuable item. The total number of horses is 1,584,000, and hogs, 6,976,000 head.

*

The Long Island Cauliflower Association has been one of the most successful selling organizations in the East. Its report for the past year shows net returns of $500,000 on 400,000 packages sold. After deducting all expenses the association has made a 10 per cent. dividend to the stockholders.

*

The 48 States of this country are now in debt $342,251,000, an increase of 50 per cent. in 10 years, according to the census report. New York and Massachusetts have the largest items. New York's debt amounting to 25 per cent of the total for all States, and Massachusetts 23.2. The per capita debt in Iowa is only three cents.

*

There have recently been several round-ups of Jack rabbits in Eastern Oregon and Washington, the result being shipment of 80,000 skins to Paris to be used in making fur hats. These rabbits are a great pest to agriculture in the Northwest. W. W. H.

"I HAVE been expecting her for some time," declared Mr. Dubbe, "and there she is." "There is who?" asked his wife. "The woman tramp," answered Dubbe. "Anybody could tell that she is a hobo. Observe how she slouches along with her shoulders humped, her stomach projecting, and her hands thrust into the pockets of some man's discarded overcoat. Yes, and look at her shoes! The heels worn clear off!" "Silly," giggled Mrs. Dubbe. "She is one of our swellest society girls, in the latest figure, gait and garb."—Lippincott's Magazine.

HERE'S one thing about roofings you ought to know—a "slowly made" roofing is the only kind that is slow to wear out.

Every foot of NEPONSET Roofing is made, not on the how fast but on the "*how-good-can-it-be-made*" principle. This takes time. But it's the only way to *surely* make a roofing absolutely reliable and 100% weather and waterproof. You buy roofing for an investment. But a half-made, "hurry-up" roofing is the worst kind of an investment. You pay almost as much. What do you get? A quick-spoiling roof—a roof that's only half a roof—a roof that is a constant nuisance and source of expense. NEPONSET Roofing is slowly made—to give a service of years—not merely to sell.

Sold by dealers everywhere. Write for name of nearest dealer.

Make Your Own Drain Tile

THE FARMERS' CEMENT TILE MACHINE

Makes tile 3 to 8 inches in diam., 12¼ inches long. One man or boy operates it by hand or power. 500 tile per day by hand, 1,200 by power. Tile thoroughly cured by patent process. No tamping or use of pallets. This machine and tile used by Experiment Stations of Agricultural Colleges and the U. S. Dept. of Agriculture. 5,000 farmers have doubled the yield of land by underdrainage, and saved 75% of cost by using our Machine. You can do the same. Save cost of hauling and breaking. Make perfect tile $3 to $5 per thousand. MACHINE SOLD DIRECT FROM FACTORY TO YOU. TEN DAYS' FREE TRIAL. SEND NOW for 36-page Illustrated Catalogue. Tells you about great benefits of underdrainage, how to take levels and get grades, make and lay your tile at low cost.

Get Your Barn Plan FREE

Star Goods Sold by Reliable Dealers Everywhere

IF you are remodeling or building a barn, *let us help!* Send a rough sketch of your barn floor and we will send a *blue print* drawn up to meet your special requirement and showing modern economies with reference to arrangement of Stalls, Stanchions, Litter Carriers, etc. No fee. No obligation. All we ask is that you read carefully our labor and wage-saving Catalog. It goes free with the blue print.

STAR Barn Equipment

(Stalls, Stanchions and Litter Carriers)

You will find many patented features on STAR LITTER and FEED CARRIERS—features that are practical and exclusive with us.

No matter what your arrangement of stalls and gutters the "STAR" is practical for use in your barn. Patented curves and switches make the STAR universally usable. Raises easily—lowers in a jiffy. Every moving part ball bearing.

Manufactured in both rod and rigid track types—in 6 different styles. Automatic dumping and returning device.

Handsome — substantially constructed — free from useless parts. Least repair expense —and most satisfactory carrier made.

The Swinging Boom keeps your barnyard clear of obstructing posts.

PUBLISHER'S DESK

There is some intimation in Albany that the Assembly will defeat the Land Bank bill and the Market bill on the ground that the Democratic administration would get too much credit for putting it through. I do not believe it. I think the suggestion comes from misinformed people. My belief is founded on the conviction that leaders of the Assembly are neither knaves nor fools. Farmers have been trying to develop a system of credits and markets for many years. The systems we had, or more correctly speaking, the lack of any system at all, has been a constant source of discussion and dissatisfaction. To be frank about it, none of us knew just what kind of system we could propose to give relief. What we propose now has been a development of years. It is the crystallized judgment of the best producers and altruistic thinkers of the State. It happens to materialize at a time when the Assembly is controlled by the Republicans and the Senate by the Democrats with quite an important element of Bull Moose representatives in both branches. But all three of the parties have indorsed the principles of these measures both in National and State platforms. The farmers want these measures now. They have waited long enough, and in the words of a distinguished naval officer, there will be glory enough for all concerned. If the measures should fail, those responsible for the failure would have trouble in making a satisfactory explanation. But I do not think they will fail. The intimations of opposition in the Assembly are persistent; but I had the pleasure of an interview with Speaker Sweet on the subject, and after due consideration he approved and recommended the coöperative Land Bank bill. I have seldom had a more satisfactory interview on legislative matters, and I have never been treated with greater consideration and courtesy in any committee room anywhere. Chairman Adler of the Banking Committee also gave us every assurance of sympathy for the measure as we explained it, and every assurance that he would give it fair consideration. There is absolutely no expense to the State in the Land Bank measure, and none worth considering in the Food and Market measure, and there is no good reason why they should not pass at this session. The time is now short and lest there should be any oversight or doubt as to the demand for these bills we would suggest that farmers write a brief note at once to Hon. Thaddeus C. Sweet, Chairman of the Assembly, Albany, N. Y., simply saying you are in favor of the Savings and Loan Land Bank bill and the Food and Markets bill and requesting him to use his good offices to secure their passage at this session of the Legislature.

Members of the Andrews Methodist Episcopal Church, Brooklyn, who invested about $12,000 in the hope of receiving dividends of at least twelve per cent. do not mistrust Frank T. Harrison, their fellow communicant and pillar of the church, but they would like to get their money back. Mr. Harrison, a trustee of the church, alleged in his voluntary petition in bankruptcy that he had been deceived by R. A. Silk and E. E. Ford. They told him that they could assure him a return of twenty-four per cent. a month, on every cent he could invest in a certain speculation they were managing. It looked so good to Mr. Harrison that he mortgaged his home at No. 479 Chestnut street, Cypress Hills, for $3,500 and gave that money to Silk and Ford, he states. But they suggested that more was required, and if he could get his fellow church members to subscribe it would be fine. Mr. Harrison, whose probity was never doubted, and is not doubted now, interested the other men in the church with the result that he says nearly $12,000 was turned over to Silk and Ford. This interest was paid for several months, according to the bankruptcy petition and then nothing more was heard of Silk and Ford.—Local Paper.

Men who want to see their money returned had better not invest it in any scheme that promises two per cent. a month.

Frank E. Winchell, who was at one time President of the Oxford Linen Mills and has pleaded guilty to using the mails to defraud in the Sterling Debenture Corporation, took the stand yesterday in the Federal District Court before Judge Anderson at the trial of Benjamin C. Mudge and six others connected with the corporation. The Oxford Linen Mills were supposed to have been using the method of preparing flax invented by Mudge.

Winchell said that in 1907 he was employed in the Sterling Debenture Corporation at $25 a week to receive visitors. Then he was made President of the Oxford Linen Mills at a salary of $5,000 a year and received a bonus of $5,000 of that concern's stock. He attributed this promotion to the fact that his brother, B. H. Winchell, was then on the board of the Rock Island system, and he had suggested that he might become a director of the Linen Mills.

From the Fall of 1907, the witness said, the literature sent out by the Sterling Debenture Corporation told of the use by the Linen Mills of the Mudge flax process, but as a matter of fact in April of the following year there was still no machinery in the mills except that which was there when the factory had been bought, and there was absolutely nothing by which the secret process could have been carried on.

At this time the Sterling Debenture Corporation, said the witness, was representing to investors that the Mudge process was a success commercially, and that the Oxford Linen Mills had $1,880,000 of stock in its treasury.—City Paper.

This about closes our chapter on the Oxford Linen Mills. We have now followed it for some years. From the very first inquiry we branded it as a promotion scheme and the stock as a gold brick. We doubt if any of our people contributed to the $30,000,000 said to be invested in it by the susceptible members of the Sterling Debenture "sucker list" of a million names.

I received a letter and my returns from the commission house to whom I sent my turkeys. I guess he sold part for 21 and part for 25 cents per pound—beat me out of several pounds, but it is all right. He has his last from me. I would not ship him a dead cat, so let me know how much I owe you. I am many times obliged to you for your kindness until you are paid. S. J. W.

Maryland.

This is a letter from a subscriber who did not get what he felt he should have had for a shipment of turkeys. The market conditions are so varied we do not know whether the commission house secured as much for the turkeys as they were worth; but the dissatisfaction of the shipper was increased by the fact that he made three inquiries as to whether the goods had been received and why he did not get his check without eliciting any response whatever from the house. It seemed the check had been misdirected, but a better feeling would have been engendered if the situation had been explained and the letters acknowledged.

Five years ago I purchased 100 shares of Old Dominion Copper Company stock on the Boston curb. Later this company reorganized. My first knowledge of this was reading it in the Boston papers. I wrote the secretary asking him to exchange my old stock, but he replied that I was too late. I still hold certificate of old stock. Can a company close its books in this way and defraud me out of my stock in the new company? This is a good dividend paying stock, and is sold on Boston Exchange under name of Old Dominion. W. L. S.

Vermont.

Our advice is that this stock was Dominion Copper Co., Ltd., which was worth 10 cents a share at time of purchase, and is an altogether different stock from the Old Dominion Company. Regarding the Dominion Company, Ltd., we learn that it was thrown into receivership in 1908 and property sold under foreclosure. It was reorganized as the New Dominion Copper Company, Ltd. The old shareholders fared badly in the reorganization. Efforts were made by dissenting shareholders to discharge the liquidator, setting aside the sale and bring suit in the State of New York, but all these attempts were unsuccessful. This is evidently a case of an irresponsible company trading on the name of a responsible company if our information is correct. J. J. D.

It was a country village, and Pat Casey was making preparations for a "flitting"—the fourth removal in about 12 months. The parish priest happened to be passing, and remarked: "What! Moving again, Pat?" "Yes, your reverence," replied Pat. "You are taking your poultry, too, I see. I think they will be getting tired of being moved about." "Getting tired?" said Pat, "why, sir, they're that used to it that every time they see a furniture van they run into the yard and lie on their backs with their legs in the air waitin' to have 'em tied.—Pittsburgh Chronicle-Telegraph.

The Best Machine for Road Work, Ditching, Land Leveling and Preparing Irrigated Land.

FOR efficiency, simplicity, and many uses they have no equal. Have proven the most practical and economically operated machines on the market. The ditching angle of the blade is an important and distinctive feature.

ACME

Pulverizing Harrow

Produces Better Crops

Because it makes a *better* seed bed than other harrows. It has long sloping knives that *cut under* the soil, thoroughly *pulverizing* and *mixing* it. They level the soil and leave a fine mulch on the surface that holds moisture in the ground.

The roots find nourishment easier in the compact seed bed.

The ACME Pulverizing Harrow is the only tool needed after your plow. It is easier on your horses, while giving better results.

Sold by all John Deere dealers. Let us mail you descriptive literature. You can grow better crops. Address

JOHN DEERE TWO WAY PLOW

The Sulky with the Steel Frame and Patent Auto Foot Frame Shift

The John Deere Two-Way Plow will work equally well on hillsides and level land. It is well balanced, easy to operate, light draft and efficient,—built in the East for Eastern conditions.

It is the only two-way plow that has the Patent Auto Foot Frame Shift, which insures accurate and uniform width of cut. It will do the highest grade work for the longest time with the least possible effort and expense.

These Are Some of the Reasons:

1. **All Steel and Malleable Frame—Steel Arch:** Light, Strong and Durable—Rigid Connections—Permanent Alignments.
2. **Patent Auto Foot Frame Shift:** Slight foot pressure swings frame and accurately locates plow bottom.
3. **Long Malleable Beam Clamps:** No collars or set screws. Beam bolted rigidly to bracket, which extends to each bail arm. Cut always uniform.
4. **Automatic Shifting Hitch:** Positive and Automatic. Clevis cannot fail to move to position.
5. **Automatic Horse Lift:** Operator's foot releases latch. Pull of team raises bottom. Hand lever also provided.
6. **Adjustable Jointers:** Jointers clamped to beam. May be set forward or back or tipped at varying angles.
7. **Wide Tread:** Prevents tipping on hillsides and permits use of wide or narrow bottoms.
8. **Chilled, Full Steel and Combination Bottoms:** All styles made expressly for Eastern conditions.
9. **Removable Shin Piece:** Insures keen cutting edge—easily renewed—prolongs life of moldboard.

CHICKEN TALK AT "FARMERS' WEEK."

"How would you keep the chicks free from lice?"

By cleaning and disinfecting the house, brooder and fixtures thoroughly once a week, exercising great care to get it into all cracks and crevices. Allow no mature fowls to run with the chicks; brood only chicks of the same age in one brooder. In natural brooding by dusting the mother thoroughly once a week with a good lice powder and occasionally applying lard to her head and body in limited quantities. Disinfecting the nest once a week, and renewing the nesting material oftener. A few tobacco leaves in the nest would materially aid in keeping all kinds of vermin from intruding in the same.

"How would you kill lice on chicks?"

By applying either melted lard, or melted lard and sulphur, mixed to a thin paste, to each chick twice a week, being careful not to apply too much, because it might injure the chicks. This is certain to kill the lice, whatever kind they are. Apply the grease to chick's head and body. In artificial rearing of chicks, I would also grease the hover curtains a little and, in natural brooding, do the same to the mother or broody. Another good way is to give each chick a thorough dusting with a good lice powder.

"How would you use air-slaked lime in the rearing of chicks?"

I would sprinkle the floor of the brooder, brooder-house, chick exit, and the ground immediately next to the building, once a week with air-slaked lime. It acts as a drier and disease germ destroyer, as well as deodorant.

"Chicks can get a certain mineral matter from fresh ground; how would you provide this to confined brooder chicks?"

By, with the aid of a spade, cutting out a piece of fresh sod ground, on which chicks have never been grown before, and placing it in the brooder. A piece about six inches square every other day would be sufficient for a flock of 30 chicks.

"How would you make the chicks exercise?"

By having a deep litter of cut straw on the floor of the exercising room, feed all grains in this litter. After the first two weeks, or sooner, allow them to run outside part, if not all of each day. In the Winter time, oblige them to go outside for a few hours about noon time.

"What kind of material do you like best for litter?"

My first choice would be cut clover, next cut straw, barn litter or chaff, sweet and free from mold and decayed particles. We like cut wheat straw better than cut oats or barley straw. We do not like sand for litter, especially the first few days, because we have found that they eat too much of it; in fact, some literally fill up on it. In such cases, of course, indigestion develops and the chick dies. Excelsior or shavings are not good material for litter in a brooder. Cut wheat straw about 1½ inch lengths is as good material for litter as we have yet found.

"Would you raise your chicks on the same ground each year?"

Most certainly, I would not. I would, under no condition do anything of the kind, unless I could in the Fall, move the house and fence and plow the entire yard. The best way would be to have at least three fields on which to raise your chicks, so that you could practice a three-year rotation in the rearing of your chicks. Where it is absolutely necessary to raise the chicks on the same ground year after year, it is good practice to spade or plow the ground each year and use lime freely, and try to grow something on the soil.

"Do you consider shade necessary in the rearing of chicks during late Spring and Summer?"

Yes, shade is very important during hot weather for the successful rearing of chicks. It is a fact that during a hot period chicks, even when very small, suffer as much as or more than in very cold weather. One way to keep the brooder cool would be to place it under a tree or in the shade of some other object. Open all windows on rear, and darken the south windows as much as possible. Probably placing the brooder house under a tree is the best way of providing the necessary shade and still allow a circulation of air.

"Would you give drinking water to chicks?"

Yes, would leave it before them all the time from the start. Would aim to have it fresh and cool in preference to warm and standing. Would renew it often, the oftener the better; do not believe in withholding it entirely or in part as advised by some. The idea that bowel trouble and diarrhœa are caused to a great extent by allowing the chicks access to water from the start, is not well founded.

"What would you do to guard against tuberculosis in chicks?"

I would give the interior of the brooders all the sun and air possible on pleasant days. On warm days, would remove hovers, turn the lower side up, so the sun could do its disinfecting. I believe in airing a brooder each day just as much as I do in airing my bedroom daily.

F. W. KAZMEIER.

Moderation in the Poultry Business.

I have never raised White Leghorns, and I presume that when a person is ignorant on a certain subject he should not venture to express an opinion. The wisest thing for him to do is keep silence. But having successfully raised Barred Plymouth Rocks for over six years, I can indorse the sentiments expressed in J. F. C.'s article on page 132, entitled "Chicken Figures Once More." It may or may not cost more to keep some heavy breed than it does to keep Leghorns, but under good conditions Barred Rocks are just as profitable as Leghorns, and sometimes even more profitable. A neighbor of mine, an intelligent and well-informed man, keeps White Leghorns. He tried Barred Rocks, but asserted that he did not understand the nature of the fowls and was not able to raise them successfully. But while a number of my Barred Rocks commence laying at the age of four and a half months and most of them lay abundantly all Fall and Winter, his Leghorns seldom begin to lay before they are six months old, and he gets very few eggs in the Winter.

J. F. C. is right when he says: "Let us get away from such extravagant theories and we shall be on the right road to business stability." Let us keep our feet on terra firma, and not try to accomplish miracles. It is said that figures never lie, but they are often misleading and likely to do more harm than good. For instance, it is well enough to read Mr. Cosgrove's reports of the Storrs egg-laying contest and to admire Tom Barron and his wonderful White Leghorns and White Wyandottes. But let us not for a moment think that in order to become successful poultry raisers all we have to do is to import Mr. Barron's stock. Mr. Barron has received a great deal of advertising for the past two years, and he deserves it. But not many of us are Barrons, and we may not be more successful with Mr. Barron's fowls than we are with our own.

The same is true of many other persons and poultry plants. Take Mr. Mapes, who not long ago described his plant in THE R. N.-Y. and showed how easy it is to get rich by keeping two or three thousand chickens. We may admire Mr. Mapes and congratulate him upon his success, but at the same time we cannot accept his advice to farmers to follow his example, as most farmers would surely fail.

The desire to excel in everything one undertakes to do is natural and praisworthy, but it does not always lead to good results. Only a few years ago a hen with a 200-egg record was considered a wonder. To-day we have records of 280 and even 300 eggs a year; but very few of us can keep such hens. The average poultryman may not be more successful with record-breaking hens than the average farmer would be with record-breaking cows. If occasionally we are the proud possessors of such fowls, we may find that the expense and trouble are in the end worth more than the chickens.

CLEMENS P. BERYLSON.

Sullivan Co., N. Y.

Hens With Sore Eyes.

Last September I put 250 pullets in an open-front laying house, and shortly after I noticed one with a sore eye. The eye became inflamed, mattery, then a large lump formed over the eye. I took this bird out and in about three weeks was better. Then one after another became afflicted in the same way until nearly every bird in the house has suffered. I have taken the birds away as afflicted, but all are well and apparently healthy now. What was the eye trouble, and has that affected the laying propensities of the birds, as they do not lay? Will they lay at all or shall I dispose of them? They are White Leghorns, well developed, red combs, and singing and happy, but don't lay. Is it wise to breed from four-year-old White Plymouth Rocks which have been good layers?

Allendale, N. J. F. M. W. H.

Your hens were suffering from a catarrhal inflammation of the mucous membrane lining the socket of the eyeball, and extending to the nasal passages. When this inflammation is complicated by one due to a certain specific germ, the disease is known as roup, and becomes much more severe. The prompt recovery made by the fowls indicates that only simple catarrhal conjunctivitis was present, but this was sufficient to check laying for a time. The effect should not be permanent, and there is no occasion for disposing of the fowls on this account. Yes; I should breed from four-year-old hens if, when mated with a cockerel, their eggs showed good fertility. Old hens lay large eggs, and large eggs produce large chicks, which we want.

FOR SALE—Best farm in Hartford County, Conn. 225 acres. Dairy, fruit and poultry farm. 80 acres of Alfalfa. Over 300 apple trees. 4 good houses. Ample barn room for cows, sheep and pigs. Equipment for 5,000 head of poultry. Land in fertile condition. Buildings in good repair. Best markets in the world—250,000 people within a radius of ten miles. Good schools. Good roads. Yale University at New Haven, 30 miles away; Wesleyan University at Middletown, 6 miles away; Trinity College at Hartford, 10 miles away. CHARLES M. JARVIS, Berlin, Conn.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED AT ONCE—Two men to work in dairy barn. Address WOODCREST FARM, Rifton, N. Y.

WANTED—Single man to work on fruit and dairy farm; must be good milker; no cigarettes or booze. BOX 279, Wilson, N. Y.

COMPETENT married man desires position managing small estate or farm. NORRIS, Box 43, Pocantico Hills, N. Y.

BOY 17 wants work on chicken farm, vicinity of New York. E. F. HANKS, Ridgewood, N. J.

WANTED—Reliable married man, work truck, poultry farm on shares; fertile soil, good home market. W. M. STEVENS, Perkasie, Pa.

WANTED—A good creamery man with some capital; married; to go in partnership in an established business. Address C. J. ANDREWS, Clearwater, Wash.

PRACTICAL carpenter, mason, painter, paperhanger (43) temperate, wants position where extensive repairs are needed. Address, B. Box 700, Hartford, Conn.

YOUNG MAN, 18, Christian, wants a job on a farm. Finished short course in State college of agriculture. W. S., 10 Zabriskie St., Jersey City, N. J.

WANTED—Position to care for poultry by woman of experience. Poultry graduate. Address POULTRY WOMAN, care R. N.-Y., 333 West 30th St., New York.

POSITION WANTED—As manager or farmer on gentleman's estate or farm. American 37, married, one child. Thoroughly experienced. Prefer place on Long Island or New Jersey. Modest wages with privileges, will board help. Address, JOHN J. WRIGHT, Bayside, L. I., N. Y.

WILL superintend or work your farm or country place. General farming, animal husbandry. Expert fruit, poultry, bees. Where intelligence, industry, integrity are demanded and paid for. Salary or shares. Best references. Married, children, colored-American. MAPLES, Mosgrove, Pa.

POSITION WANTED BY AMERICAN, age 42, as working farm manager or superintendent on or before April 1st; 20 years' practical experience: stock raising, modern dairying, raising crops and Alfalfa, soiling, farm machinery, gasoline engines, poultry, etc.; best references; please give particulars and wages. Address P. O. BOX 16, Dummerston Station, Vermont.

WANTED—April 1, position on farm by sober, industrious, single man of 30, capable of taking charge of farm and dairy or would accept any position of trust where stock is concerned. 6 years on last farm. State full particulars and wages in first letter; best references given and required. J. H. SHARP, B 5, Little York, N. Y.

WANTED AT ONCE—Experienced herdsman for Holstein dairy. Have steam boiler turbine separator and gasoline engine. Must be good milker, feeder. Understand butter making. Only men who have made good need apply with references. Wages $35 and board. L. E. PALMER, Supt., Richfield Springs, R. R. 2, N. Y.

WANTED—Cyphers incubator. A. O. CHAPIN, Sharon Springs, N. Y.

PURCHASE ALFALFA HAY direct of the producer and save money. F. P. ERKENBECK, Fayetteville, N. Y.

FOR SALE—14 Prairie State Universal hovers with regulators, 1913 model, $4.25 each. Just half price. H. BACON, Berwyn, Maryland.

TRY Shamrock brand pure home-made candies and pop-corn confections. (MRS.) M. O. P. KEOWN, Deposit, N. Y.

PURE HOME-MADE CONFECTIONERY by parcel post. Send for price list. H. I. WHITE, Ballston Spa, N. Y., R. 3.

PIANO PLAYER with fifty rolls music, cost $200. Will sell for $60, good as new. LOCK BOX 313, Marlborough, N. Y.

FOR SALE—25 tons Alfalfa hay, 30 tons one-third Alfalfa two-thirds Timothy. $18 per ton. F. O. B. BRIDGE BROS., Canastota, N. Y.

SPRAYING OUTFIT FOR SALE — 200-gallon tank; spiral agitator; Gould's triplex pump; Fairbanks engine, 3 horse-power; mounted on steel trucks with brakes; nearly new $150. F. ROSSMAN, Valatie, N. Y.

FOR SALE OR EXCHANGE—One-horse power, also two-horse Ironage walking cultivator for clover hay; chickens, etc. DEWITT C. GILBERT, North St., Danbury, Conn.

FARM—168 acres, best corn land, $100 per acre. Address owner, D. E. CHILD, Findlay, Ohio.

FOR SALE—A suburban fruit and poultry farm. Address I. OWEN, P. O., Paterson, N. J.

FARM, 25 acres, $600. Old style house, barn; 10 miles from R. R. F. G. SEARS, West Cummington, Mass.

FOR SALE—Fine farm, 100 acres river flat, 65 pasture, good buildings, well watered, State road. D. M. SATTERLEE, Franklin, N. Y.

FRUIT FARM and boarding house in the Catskills, 49 acres, price $2,000. THOMAS WILLSON, Crlton, N. Y.

FOR SALE—Dairy farm with milk route. Modern sixteen-room house, good barns; 500 acres of land. Write Box 586, Saranac Lake, N. Y.

FARM WANTED in New Jersey, 20 to 30 acres, within 60 miles of New York. Must be cheap. What have you to offer? F. S. W., care R. N.-Y., 333 West 30th St., New York.

TO RENT—Village farm, 100 acres, new buildings; silo; all improvements; all tools; four miles of city over hundred thousand; stone road; must furnish stock. J. B. NICHOLS, R. F. D. 4, Bridgeport, Conn.

I'll Send You This Big Can of CORONA WOOL FAT Post Paid

SIMPLY mail me the coupon below and I'll send you this big can of *Corona Wool Fat*—the greatest preparation ever put on the market for Cracked and Split Hoofs, Contracted Feet, Corns, Grease Heel, Thrush, Barb Wire Cuts, Sore Shoulders, Sore Teats on Cows, etc. I want to prove to you ***before you pay me a single cent,*** that here is a preparation you can't afford to be without. I want to send you, postpaid, this big can on

20 Days' Free Trial

I want to show you that you can keep your horse's hoofs in the finest condition—take out all foot soreness, cure all flesh wounds, etc. and do it quickly.

I want you to try this wonderful healing ointment at my risk—not yours. Try it on any case you have—apply part or all of it. At the end of 20 days if you are perfectly satisfied, send me only 50c for the big trial can. If you are not satisfied, tell me so and you won't owe me a penny.

CORONA WOOL FAT

The Wonderful Healing Ointment

is extracted from the skin and wool of the sheep and is the only remedy that will penetrate the shell of a horse's hoof—take out the soreness and grow new hoof. ***Corona Wool Fat*** does not burn, blister or cause suffering. It is a cooling, healing, penetrating ointment, quick in action, ***heals without leaving a scar.*** Read these letters—we have thousands more like them:

Corona Mfg. Co., Kenton, Ohio.

Gentlemen:—Corona Wool Fat is the best thing I have ever used for hard and contracted feet of horses. I have used about all kinds.

Yours truly,
P. D. Jamison,
Bridgewater, Maine.

Corona Mfg. Co., Kenton, Ohio.

Gentlemen:—I like Corona Wool Fat. I think it is fine to heal sores and cuts, and can truly recommend it to any one needing a good healing salve.

Yours truly,
Dewitt Conrad,
23 State St., Fort Plain, N. Y.

Send No Money—Simply Mail Coupon

Fill out the coupon and mail it today. When you receive the ***Corona Wool Fat*** —try it—watch results—then if satisfied send me only 50c—if not satisfied, just write and tell me so and I'll charge you nothing. Write for the big trial can ***now.*** Remember, I send it ***postpaid.*** You risk nothing in testing it. ***Will keep your horses in working condition and put them in selling condition.*** I take all the risk—send today.

Corona Mfg. Co., C. G. Phillips, Manager 3806 **Corona Blk., Kenton, O.**

IT WILL CURE

Hard and Contracted Feet, Mud Fever, Split Hoofs, Corns, Grease Heel, Thrush, Quarter Crack, Cuts, Barb Wire Wounds, Sore Teats of Cows, Ulcer, etc.

Our Guarantee is on the Lid of Every Can.

I have sent out over 100,000 cans the past eight months, and now have more than that number of satisfied customers. You need it; I have it for you, and you can try it out on the "before you pay" plan. Now, all I ask is a fair, square trial on its merits. *C. G. Phillips.*

Proof!

Corona Mfg. Co., Kenton, Ohio.

Dear Sirs:—I received the Corona Wool Fat all right and have tried it and it works just as you recommend and even better. My horse was sore in the front feet and she could hardly get out of the barn, and in two weeks time she improved so much that she was as limber as ever, and our blacksmith stated that he never saw anything as good as Corona Wool Fat.

Sincerely, T. J. Tishell,
North Rush, N. Y.

Corona Mfg. Co., Kenton, Ohio.

Dear Sirs:—I have had several cans of your Corona Wool Fat and it has given good satisfaction, and as I was unable to get any in this section I wrote to you. Please send me price list of your Corona Wool Fat Ointment. I used it on a horse that had a very bad quarter crack, and by spring it was grown down and clear out, and I never let him stand a day with it. I think it is the best preparation I ever used for all kinds of sores.

Fred Stout, Monroe, N. J.

Corona Mfg. Co., Kenton, Ohio.

Dear Sirs:—I am very well pleased with Corona Wool Fat, and am enclosing you remittance for more of this wonderful product. It is great stuff. Yours truly,

Louis J. Dumont,
R. F. D. 1, Wolverine, Mich.

Corona Mfg. Co., Kenton, Ohio.

Gentlemen:—Corona Wool Fat is just the stuff for my bank mules feet as it keeps the bank water from cracking their feet and getting sore. Enclosed find remittance for $3 for which send me a ten pound pail. Yours truly,

W. F. Williams,
New Sharon, Iowa.

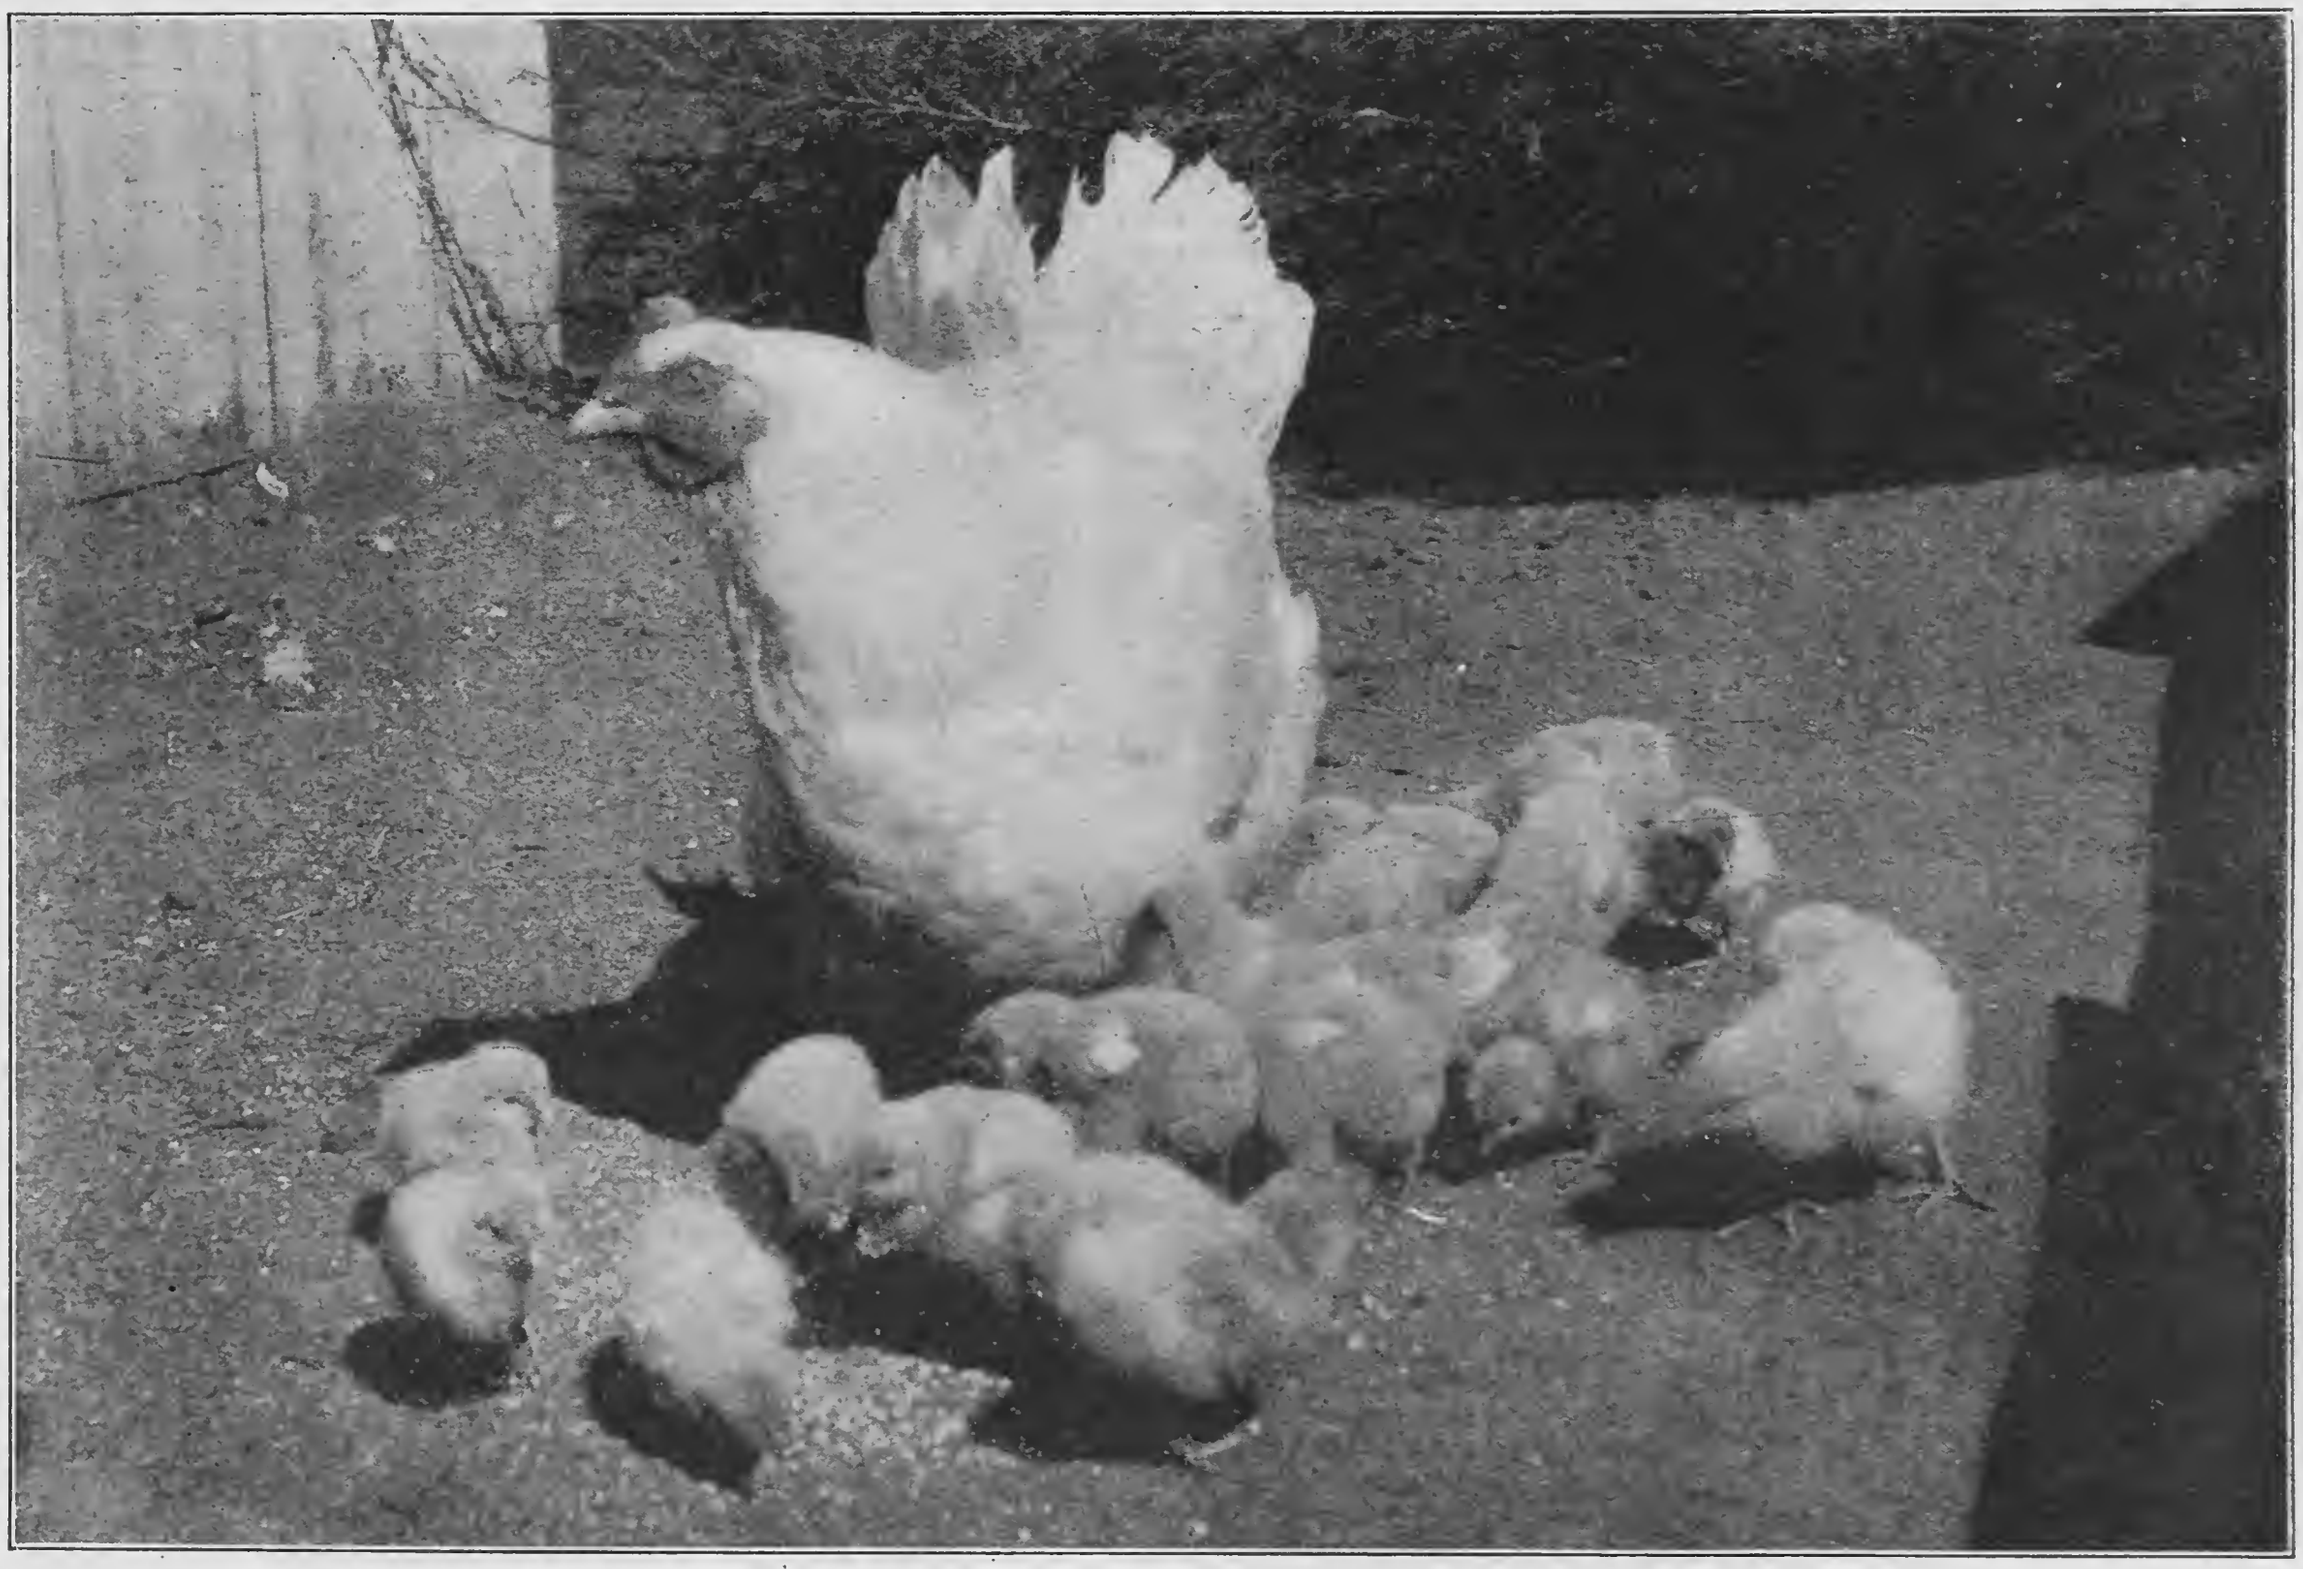
ECONOMY IN RAISING CHICKENS.

Pastured in the Cornfield.

CHICKS IN GROWING CROPS.—Economy, meaning a wise adaptation, rather than the limiting of cost merely, I have in mind in arguing for the rearing of chicks among growing crops. The experiment station up at Guelph, Ontario, has demonstrated that chickens may be grown at less cost in cornfields than upon sod. However, this is but one part of the story, for the relative worth of chicken variously grown as well as the attendant advantage to the crop are features well worth considering. In my personal experience I have found the cornfield an unrivalled place for the young broods. I have listened to argument favoring the close yarding of chicks, based upon the claim of more rapid growth. Within certain limitations this may be, as compared with underfed chicks at large. But we must not confuse mere bodily growth with proper development looking to the conserving of vigor, upon which egg production depends. And the test of the scales does not show this. Confinement in yards and forcing for growth is all right for cockerels destined for the market; but flesh is not synonymous with the full egg-basket later on. This matter of environment is a more serious matter than the novice would think. The most approved house with its open front calls for the three remaining walls to be airtight, to ensure against draughts, and this for mature fowls amply protected by feathers; for their plumage naturally adapts them to withstand cold, but not winds. But how often we see the tender, unfledged chicks thoughtlessly exposed to winds.

NEEDS OF CHICKS.—To understand why a field of corn is so suitable a harbor for chicks, we must bear in mind their varied needs for shelter from winds, a moderate degree of both sun and shade, and inducement to much active exercise with the rich reward it brings in the form of insect food. The fullest possible amount of exposure to the sun's life-giving rays is indispensable for the greatest vigor, but this must be tempered at the seasons of greatest heat. An orchard gives too much shade and generally little protection from winds. In the cornfield the various extremes are corrected. From the time the stalks are a foot high the chicks begin to find protection. The yarded chick is generally a lazy one; but not so those in fields often cultivated. No field is so effectually tilled as that one where a flock of active scratchers have their home. The cultivator is an active factor one moment in a week or more. If its beneficent work is so well proved by its influence upon the crop, how can we ignore the benefits resulting from the constant sniffing of the chickens' feet?

CROPS SUITABLE FOR RUNS.—The range of crops the chicks may be domiciled among with mutual benefit is a long one, embracing most vegetables usually to be found in gardens. I am aware that current opinion is not favorable to chickens in the garden, but that is founded upon theory and poor management, not skilled practice. Not in its broad Western meaning, domestic fowls of any age,



MOTHER AND HOME. THE OLD ORIGINAL FIRELESS BROODER—WITH BRAINS TO IT. Fig. 182.

do I use this word "chicken," but in its proper sense of their innocent young, nor would I be understood as advocating an indiscriminate mixing of chickens and all garden crops. A chick's natural appetite for greens must be allowed for, and economical feeding calls for as large a proportion of vegetable food as possible. This appetite is readily kept within a narrow range so long as that form of green food they have become accustomed to is abundant within their reach. The early broods which are eventually to range in the garden will have been put out on a piece of sod adjoining. From the time of planting no mature fowl is to be allowed to range, and so to teach the young the edible quality of any of the germinating plants. The habit of picking the young, tender blades of

grass seems to satisfy them, provided this is kept in a fresh condition by frequent mowing. The few vegetables especially tempting to chicks, such as lettuce, spinach, beets, are to be planted within some enclosure. Corn, beans, peas, squash and turnips do not tempt them. Tomatoes suffer in no way until the fruits begin to ripen. However, I must not omit the indispensable condition that the chickens are to be fed regularly and have an unfailing supply of drinking water close at hand. I once returned from a day's absence and found the chickens picking into the ripe tomatoes, and soon traced the cause to empty water fountains. In case they get the habit of eating this fruit it is easy to save the crop by picking at first turning color and putting away in some warm place to ripen.

FEEDING THE CHICKS.—It is my custom to keep whole wheat constantly before growing chickens; and in addition to feed a moist—but not wet—mash each morning. This mash is composed of ground oats in large part and wheat by-products, and contains a varying proportion of fine sifted beef scrap, is mixed with milk when procurable, and is fed as nearly dry as a wet mash may be made. A sloppy mash is a good fattening ration, but not a proper one to secure growth. Regular feeding is just as important to get well developed chicks as to prevent their experimenting among the garden crops to appease their hunger. With proper management I have grown a flock of 200 chickens in a two-acre garden, and at the close of harvesting the sweet corn for market, both early and late, I have had the satisfaction of teaching the chicks to clean up the refuse ears. Systematic management is the keynote of successful chicken gardening. A single mature fowl would queer the whole system in an hour's time if allowed freedom in the garden.

POULTRY ECONOMICS.—It cannot be gainsaid that the New England farmer has unmatched advantages when it comes to real economical growth and upkeep of poultry. Neither corn nor chickens display so much thrift as when grown together, and at the close of the season the one will begin to feed the other. It has been shown repeatedly that in connection with farming corn may be grown at no actual expense, the feeding and manurial value of the stalks paying for the crop of ears. Again, a properly managed flock of chickens gives us pullets at maturity clear of cost, the marketed cockerels paying the bill. With both the flock and its feed at zero as regards cost, and our market clamoring for fresh nearby poultry products, the question forces itself upon us: Why does New England bring the bulk of supply from outside? The answer is easy. The boy in the story went to mill with the stone in one end of the bag to balance the grain in the other, "because father did." The money that should represent profit pays for both Western-grown grain and the transportation of it, in order to make milk to sell at starvation prices; and the farm's fertility thus depleted, they give transportation another lift by purchasing chemical manures. Opportunities have developed which the farmer has not yet opened his eyes to.

The good old corn-crib, which has become almost a mere tradition with us, is bound to return. In feeding value for poultry our flint corn is superior to the dent varieties, approaching nearly to that of wheat, when well seasoned. I know a farmer who uses two corn-cribs and keeps a crop over one year before feeding, with remarkable results in the production of Winter eggs. This plan was adopted after experience had demonstrated the new corn to be a comparatively poor egg-producing food.

HENS AND DAIRY.—It is unnecessary to supplant the dairy in order properly to develop the poultry interest, for poultry may be most economically handled only in connection with cattle. Where convenient to a demand for cream, this or the butter can be economically marketed together; and the skim-milk or buttermilk is a most valuable food for the poultry. Where the corn-crib displaces the silo, the dried fodder is still an approved ration for the cows. I am getting more milk this Winter from my family cow (now two years farrow), feeding hay and stalks alternately, than she was giving last Winter upon a ration of hay and shorts. Red clover should regain its former place as a farm crop, both as a soil improver and to help out the hens' bill-of-fare. When properly harvested, retaining the leaf and blossom and finely chopped, they simply revel in it. With mangels or rutabagas raised in abundance to eke out the corn and clover, a good share of the food for poultry is produced on the farm.

Considering the need for poultry especially in the growing period to get to the tilled soil and enjoy the benefits of shelter among growing vegetation in order to thrive at their best, also the need to turn their manure to practical account, the farm has a manifest advantage in the economical production of poultry and eggs. Permanent runs soon grow foul and the effect is soon apparent upon the fowls. But the rotation possible upon the farm, with new and wholesome quarters for the young broods, is essential to best results. The farmer who consistently works into poultry, establishing a corn and chicken partnership, so to speak, has a lead upon the poultry specialist in constricted quarters in every economic sense. FRED W. PROCTOR.

Massachusetts.

PROPER GROWTH FOR TREE.

It seems to me a correct course to take, during the first few years of the orchard, to attempt to get the tree quickly from the nursery size, as planted in the orchard, to a well-balanced, well-grown tree, ready for its business of fruit production. After this purpose is attained, so to handle or control conditions as to get these returns from the tree as regularly, and of as good character and large volume, as consistent with regular bearing. In handling the peach, the tree formation period may be expected to cover three growing seasons, and I would not object to any large growth obtained during this period, provided the trees finished their growth by end of Summer, say September 1, for this locality, (Southern Connecticut), so the new wood growth would ripen up well before freezing weather might be expected to set in.

In a well-drained soil, and with the use of a well-balanced fertilizer, so made up and applied as to give the push to the trees early in the season, I should be glad of the large wood growth that would be reasonable to expect, especially when accompanied with good tillage. With different conditions of soil and a fertilizer treatment and tillage conditions that would tend to late growth, I would want but a moderate growth on account of danger of weakening the tree from freezing the immature or soft wood that might result from a vigorous late growth.

To a certain extent the handling of the apple might be along similar lines as the peach. When the size of the tree is such as to make the fruit yield worth while, as to quantity, I would want to slacken down the growth of the tree somewhat, especially the apple, and be satisfied with a moderate new wood growth each season.

In a middle-aged peach or apple orchard, I should be satisfied with a new wood growth of 12 inches, provided it was accompanied by the foliage color indicating vigor and the setting of fruit buds and spurs in abundance. In a young orchard, in the (permissive) strong-growing period, I would not object to the growth of three or four feet or more provided, as said, the growth was made early in season. J. NORRIS BARNES.

Connecticut.

A STUDY OF SOIL WATER.

The Literary Digest, January 10, 1914, reports an interview by the Wilmington (Del.) Morning News with Samuel Wesley Long, in which Mr. Long predicts that within a comparatively short time—50 years or less—if the present rate of deforestation and careless methods of cultivation are continued the United States will become a desert.

Commenting on the above the Literary Digest says: "That the ground-water level of the United States has lowered nearly to the danger point is shown by data collected by the late Dr. W. J. McGee for the Department of Agriculture. Reports from 30,000 sources covering practically every county in the country show that the rate of change varies from region to region and State to State ranging from a slight rise in irrigated districts to a lowering of about 3.5 feet per decade. In the 31 States covering the half of the country best adapted by natural conditions to feeding and clothing a great people, the average lowering since settlement would appear to be no less than nine feet, i. e., from well within to about the limit of capillary reach from the surface. Will THE R. N.-Y. explain just what is meant by the ground-water level? What determines the "limit of capillary reach from the surface?" Travelers tell us that the land in China has been tilled for 2,000 years and it is still very productive. How have they succeeded in maintaining the fertility and soil moisture for so long a period? Do they retain much land in forests and do they plant trees to keep up the acreage? Europe is also a much older country than this, yet their land is much more productive, their average wheat yield per acre is, I believe, more than twice that of the United States. How have they succeeded so well? What portion of their lands are in forests? A few years ago we heard much of the benefits to be derived from subsoiling. Why do we hear so little about it nowadays? Has it proved beneficial to any kinds of soils and if so, what kinds? What is a "plow soil?" Is it reasonable to expect any possible benefit from subsoiling sandy soil with its already too porous subsoil? R. J. E.

Berrien Co., Michigan.

The ground water level is the depth below the surface at which the ground is saturated. This is shown by the height of water in ponds and wells. Statistics of the changes of level in the latter through the country were used by the late Dr. W. J. McGee as a basis of his study of the relative amount of soil water to-day and at the time of the settlement of the country.

The capillary reach from the surface is determined by the character of the subsoil and ranges usually from 10 to 30 feet. The finer the soil particles the greater distance will capillarity be effective in bringing ground water to the surface. As to the productivity of China, it is the result of most thorough tillage and conservation of every source of humus and plant food, the cheapness of labor being favorable to this intensive farming. Forestation is not a feature there, but a beginning is being made in tree planting of recent years, and as their production is mostly in the river valleys, the supply and level of ground water must be maintained by these streams. Irrigation, hand watering, and their extensive use of rice, which is grown in wet lands, may also help to explain how their millions are fed in a land that has had 40 centuries of farming. In Central Europe, forests are maintained in the interest of conservation, Germany not allowing the cutting of trees except under regulation of law that requires replacement of those removed. The larger crop yields abroad are again owing to hand labor and intensive cultivation. About one-fourth of Central Europe, we are told, is in forests; and no report has come to hand of any lowering of level in the ground water there.

The plow sole (a condition that is more common in the South) is a product mostly of poor plowing and can be remedied by use of a better type of plow. This, an official of the Agricultural Department informs us, is now being worked up by the department. Crops with long tap roots, like clover, penetrate and break up this under crust, too, and it is a condition easily remedied by good farming. Subsoiling is less practiced than formerly by the best farmers, probably owing to more tile drainage and the greater use of deep-rooted plants in their rotations. These plant roots, I believe, are the best subsoilers for most soils; certainly for those that have a gravelly bottom.

To return to the subject of diminution of soil water in the country; this is true. Dr. McGee states that this loss approximates 10 per cent. of the original store, and has viewed the result of this loss already realized, and of its continuation, with serious concern; yet not as an alarmist, as his associate Dr. Newell of the Reclamation Service, tells me. The loss though continuing, is becoming less in recent decades, and were serious consequences to our national productiveness to follow, they would appear not in 50 and perhaps not in 150 years. Meanwhile these remedial measures are suggested by him: The forestation of a proper portion of the country; the tillage of the farm area with a view to the absorption into the soil of all rainfall possible to secure, and generally to avoid all surface waste of storm water. This whole matter is treated at length in Bulletin No. 92, Bureau of Soils, United States Department of Agriculture.

E. F. DICKINSON.

SAVING THE CITY SEWAGE.

In European cities the question of the proper disposal of sewage from the large towns has become a big one, not only because of the menace to health, which this sewage presents. It also contains large quantities of fertilizing and building material which ought to be utilized. Millions of dollars worth of plant food are flowing on to the ocean through the rivers of this country, and too little effort has been made thus far to put a stop to this flood. Without question, the future must see a change in this matter of handling sewage. We must make use of the plant food rushing away in this manner, and the question of health demands some radical action.

German and French cities have taken hold of the subject, and have made much progress. Reports from our foreign consuls give interesting statements about the way the work is done. In some cases, the sewage is filtered and the liquid part used to irrigate farms and gardens at some distance from the cities. Certain parts of the sewage, such as the bones, are boiled or steamed, and this appears in the form of tankage, which is ground up to be used as a fertilizer. In other cases, the sewage is burned, the heat thus produced being utilized for the production of electric power. The ashes and cinders mixed with concrete are pressed into building blocks, which are said to be of a very high quality for certain uses. All sorts of devices are being made on the other side to handle this sewage in an economical manner. In fact the time has come in Europe when wastes of this kind must be prevented under the greatest economy of social life. We have not quite reached that point in this country yet, but must consider saving these wastes.

GROWING THE OSAGE MELON FOR PROFIT.

PART I.

In order to grow and market the muskmelon profitably there are a few essentials that enter into the work that are important, and first is a fertile soil. In the growing of the Osage this is necessary, and perhaps a good many of the failures are due to neglecting this important factor. Unlike the smaller melons of the Netted Gem or cantaloupe type, which will develop and reach its size on a comparatively light soil, the Osage, in order to mature and develop its size must have a richer soil. As it is desired to ripen the melon early, a deep rich fertile sandy loam, which lies up high and dry and is naturally well-drained, makes an ideal place for the growing of this melon. A good clover sod plowed under in the Fall and then covered with barnyard manure in the Winter will put this soil in good physical condition for growing the crop.

PUTTING IN THE COMPOST. Fig. 183.

The preparation of the soil has much to do with the future of this crop. Since melons delight in a high state of cultivation it is important that we put all the work we possibly can on this field before the melons are planted. Hence, in order to conserve all the moisture possible it is well to fit this field early in the Spring. If the soil has been top-dressed with manure it can be thoroughly disked and harrowed and several crops of weeds killed before the melons are transplanted to the field, and will cut down the expense of caring for the crop later on.

As it is the early melons which usually prove most profitable, the plants are started in hothouses or cold frames, and can be grown in flower pots or plant boxes, which are made in three sizes for that purpose. These boxes are made 4x4x5, 4½x4½x5, and 5x5x5 inches deep, the 4½x4½x5 deep being the size most commonly used. A compost is made for these boxes of about two parts rotted horse manure to one part rich sandy soil, new soil from the woods being preferred. In our experience we have found that the poultry droppings from the henhouse added to this compost, and thoroughly mixed proves to be very beneficial.

The plant boxes being placed in the bed are packed close together by laying 2x4 down and with an ax driven up close together, as shown in Fig. 183. The compost, after being worked over thoroughly several times (this is important, as in order to grow plants all alike, the soil should be alike) is hauled to the cold frames and thrown into the boxes, levelled off, and punched down firm with a block of wood, or something that will fit the box. Some people prefer using their fist for this purpose, as shown in Fig. 184. After the soil is made firm in the box, more woods dirt or leaf mold is used to fill up the box, this being worked through a wire screen to take out all the roots, leaves, twigs and trash, which renders the planting of the seeds less troublesome. The dirt is then levelled off, and two seeds are sown in each box, and if these seeds can be sown immediately after the boxes are refilled the dirt will be found to be in a fine condition for seed, neither too wet nor too dry. The boxes are kept moist but not too wet, and after the plants are a week or 10 days old we usually thin to one plant, leaving the strongest, healthiest plant. As it is desirable to grow a rather short, stocky plant, the beds should have as much air as the weather conditions will permit. Right here is where melon growers sometimes encounter serious trouble by plants damping off. This is caused by a fungus attacking the plants on the stalk where drops of water have collected. To overcome this trouble it is necessary to air or ventilate the beds after watering the plants so as to dry off the stalks of the plants and to keep the water drops from collecting on the plant stem.

When plants are about five or six weeks old, or when the danger of frost is over, they should be transplanted to the field. The field should be marked both ways, setting them about five feet each way. A single shovel plow is about as good a tool as we have found for making the furrows for the plants, plowing the furrows one way and setting the plants on the cross marks.

Plants should be well watered before taking from the hotbed, and if flower pots are used a slight tap with one hand on the bottom of the pot will bring the plants out intact, but if boxes are used the opposite corners of the boxes should be cut with a knife, which will make it possible for the plant to be taken out without disturbing the plant or roots. Soil should be pressed firmly around the plant, taking care not to press the box dirt or break the roots of the plants any more than is necessary.

H. B. BLANDFORD.

"CO-OPERATION."

Farmers are a very patient class of people. They have endured the 35-cent dollar for many years. They are slow to demand justice. For 35 years the Patrons' Mutual Insurance Association of Logan County, Ohio, has given to its members insurance on their property against loss or damage by fire or lightning at a cost of $1.40 per $1,000, while stock insurance companies continued to charge an average of $3.35 per $1,000, but there are still some farmers who are willing to use their hard-earned 35-cent dollars to pay these high rates for insurance.

Last Spring we organized for the purchase of supplies and found that we could get a saving of five to 25 cents on fence posts by buying in carload lots. Agricultural lime has been selling at $5 to $6 per ton. Buying directly in car lots enabled us to get fine ground lime at 90 cents per ton, freight included. We purchased fertilizers at a saving of about $6 per ton on the different brands; 16% phosphate cost $11.90, including freight, when agents were selling this grade at $18. Our executive committee has just closed a contract for 1,000 tons for March delivery, and this means a saving to the purchasers of about $6,000.

Cottonseed meal, coal and spraying materials are among the other goods that have been purchased in this way. On cottonseed meal the saving was about $9 per ton. On coal the saving is only $1.

It is true there are some who find fault and say the farmers should buy at home. If the goods were produced at home this argument would have some effect but when we know the dealers must send out of the community the same amount of money that we do, to purchase the goods from the producer and pockets a nice profit from every sale, the argument of buying at home has little logic in it. The dealer never hesitates to buy apples, potatoes, wheat, corn, etc., outside the home markets whenever he thinks he can do so to advantage. The farmer has the same right. We have no fight against the home dealer who is willing to sell us his goods at a reasonable margin of profit, but when he seeks to compel us to buy at home and pay unnecessary profits on goods produced in other localities, we reserve the right to buy elsewhere.

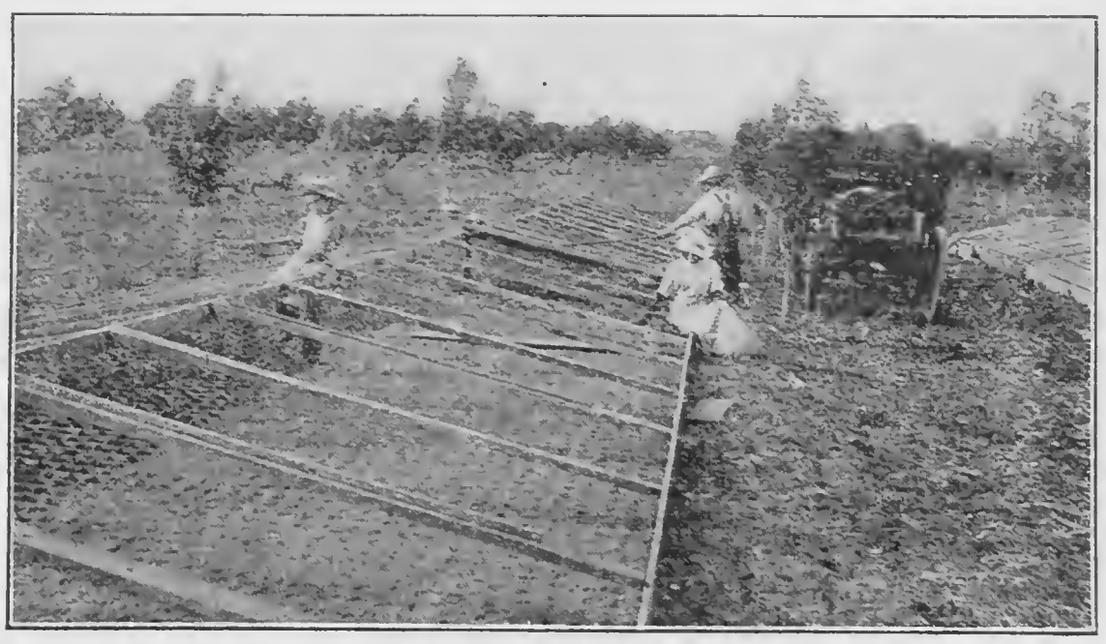
SECTION OF OSAGE MELON. Fig. 185.

Dealers were asking 75 cents per gallon for lime and sulphur solution when the wholesale price was 20 cents. Their price for arsenate of lead was 30 cents when the wholesale price was 12 cents. Thus far no effort has been made to sell products through the coöperative organization, but if it becomes necessary to do so in order to get fair prices this step will come in time.

In addition to the money saving effected through this organization it is teaching farmers the advantage of paying cash for goods. One of the most disagreeable of all bad habits is to run bills at all the stores. Merchants lose much money through the bad and uncollectable accounts. They must make profits enough off the cash buyers to make up for the loss sustained on the credit buyers. For this reason the man who pays cash cannot afford to deal with the merchant who sells on credit. The entire credit system so far as it applies to provisions, dry goods, clothing and farm supplies is at fault. It is better to borrow money at 6% to pay for such supplies than to buy on time. The easiest time to pay for an article is when you receive it. If one waits till the article has been eaten or worn out he does not fully realize its value.

Ohio. JOHN L. SHAWVER.

PUTTING PLANT BOXES IN THE BEDS. Fig. 184.



LEVELLING OFF THE FRAMES. Fig. 186.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Arbor-Vitæ Hedge.

How far apart should American arbor-vitæ be planted to make a close permanent hedge? When should they be planted? Are Americ .n Arbor-Vitæ breeders of Cedar rust? N. H. S.

Grape Island, W. Va.

Set the arbor-vitæ two feet apart; even 2½ to three feet will result in a close hedge in the course of time. Set in Spring, a little later than deciduous trees, observing the precautions, so often advised for keeping the roots moist. Prepare the trench well for planting, and after setting mulch the surface. We have no knowledge of cedar rust occurring on arbor-vitæ. This disease appears on the Red cedar, Juniperus, which is botanically distinct from the White cedar or arbor-vitæ, which is a Thuya.

Grafting Pear on Thorn; Wild Grapes.

1. If you have had experience in grafting pear on the thorn tree (or thorn apple tree) will you give the result of it? Which is the more profitable to graft, the stock or root of same? 2. Do you know of anyone grafting the tame grape on the wild stock, or roots? If so with what result? A. J. S.

W. Fort Avon, N. Y.

1. I have long known that the wild "thorn" trees may be grafted with both apple and pear and have done it myself, but the union is not very satisfactory. The stock does not grow as fast as the grafts, and although they will bear fruit they often break off in course of time. The common practice is to top-graft, but it is possible to root-graft also. 2. Wild grape vines may be grafted with the cultivated varieties with good success, for they are very close akin, in fact many are of the same species.

H. E. VAN DEMAN.

Smut on Corn.

Can you tell me why my corn was so affected with smut last year? I had in about 10 acres, half of which was on new ground, which did not seem to be affected, while that on ground I had raised corn on for three or four years without change was badly affected.

Chester, N. J. J. C. C.

The new ground was free from spores of the smut fungus, hence the immunity. On the other hand, land on which this crop had been grown without intervening rotation for several years would be very likely to carry the fungus. The smut spores live and even increase in manure, thus may spread the disease in fields to which such manure is applied. The fermentation of silage, however, destroys smut spores. Corn smut can be greatly reduced by the use of Bordeaux mixture, but it is not believed that results warrant the expense. The most practical plan is to go through the fields, cutting out infected stalks or ears, which should be burned, not thrown on a rubbish heap. If this practice is continued yearly smut will be greatly reduced, especially if the work is done on adjoining farms also. Unlike other grain smuts, the fungus is not conveyed by the seed, so seed treatment is entirely useless. Infection is conveyed by the smut spores falling upon tender parts of the growing plant. Moisture, rich soil and close planting all predispose the plant to smut infection, because of soft texture induced. Continue to cut out and destroy the smut masses, and do not plant the infected fields to corn this season.

Educating Peach Buyers.

To the grower who can work up a special market there is no doubt in my mind that his rewards will be in proportion to the high quality of his fruit. I have found it so in peaches, for by allowing them to ripen on the tree instead of picking them as solid as rocks, I have been able to convince people that Massachusetts can grow as good a peach—they call them better—as any other section of the country, and my customers are willing to pay for them. In spite of the glut in the market last year I kept my prices as usual at $1.50 for firsts and $1.25 for seconds, with extras at $2, and found that my customers preferred to pay my prices and know they were getting as fine an article as I could produce rather than pay half of it and get an inferior article. I called my Ferncroft (our farm name) peaches, the peach that "tastes like more," while the others many times were of the quality described as "one taste is enough."

I think we have "queered" the market for the green picked peaches shipped in from outside as our fruit stores do not seem to be able to sell them at "give-away" prices. Our consumers are educated to the fact that there is such a thing as a peach that melts in your mouth and really tastes like more, and they will take nothing else. We say "eat what you can and can what you can't," and we find often there is a rush for "canners" at the end, as all previous baskets have been eaten up. We advertised our large Elbertas as "company peaches" for canning and we trust our folks are well stocked, for the peach crop is wiped out in Massachusetts and I believe in Connecticut so far as a commercial crop is concerned. If one can stand the strain of edueating his customers he will win out, but it cannot be done in a season. F. HOWARD BROWN.

Massachusetts.

"FAMILY" USE OF DRUGS.

On page 217 I notice that M. B. D., in answering a query as to the use of Fowler's solution in human ailments, says: "It is a valuable drug, much used in medicine, but is a powerful irritant and depressant poison in overdose, *and should never be taken or given except under the direction of a competent physician.*" I have noticed that M. B. D. has answered a number of other queries relative to human ailments in much the same words as I have underlined above, to secure the services of a competent physician. What is one to do when this advice cannot be followed? For instance we lived here for 11 years before we had a doctor nearer than 30 miles. Don't you think that under those circumstances we would be justified in studying the diseases the human body is subject to, and, so far as we are able to do so, apply the necessary remedies, including arsenic if necessary? E. J. T.

Cokeville, Wyo.

After years of experience in applying drugs to the relief of human ailments, the writer is convinced that no better advice, or no other safe advice, can be given the layman than to take or give drugs only under the supervision of a competent physician. If exception could be made to this rule, it would be in the case of those who may live "30 miles from a doctor," but even then, the drugs used should be few and simple; certainly never such active poisons as arsenic. It would be a splendid thing if all people so situated could know what to do in the emergencies that arise, particularly how to safely relieve severe pain, but for an untrained person to attempt to treat disease with such drugs as aconite, laudanum, etc., would be folly equal to giving a child a stick of dynamite to play with; of course, in either case, no harm might be done.

If it were generally understood, as it should be, that with so few exceptions that they can probably be numbered on the fingers of one hand, drugs do not cure disease, there would be less temptation to experiment with them. Nature cures the disease; drugs can only help nature, and they cannot even do that unless administered by one who understands their action and their limitations. On the other hand, ignorantly administered, they are capable of doing infinite harm. The universal human desire to take something when feeling ill, and the very natural tendency to attribute any subsequent relief to whatever may have been taken, are very largely responsible for the "patent medicine" habit and explain why testimonials to the marvelous virtues of some advertised remedy are sometimes signed by men of exceptional attainments in lines of work that have not taught them anything about drugs. As to the drug in question, arsenic, while valuable in trained hands, it is never an emergency drug, and the only reason for its mention in a journal not devoted to medicine is that it is often given to horses for the relief of heaves; even here, the horse owner should understand that he is administering a drug as potent for harm as for good. M. B. D.

TEACHER: "What is a pedestrian?" Country Pupil: "A feller what gets run over by an automobile."—Boston Transcript.

Plant Apple Trees That Bring Profits

Apple trees, like people, are happiest when in the right location. Most kinds grow well in New York and New England, but tests show that

BALDWIN :: McINTOSH :: SPY
STAYMAN :: :: R. I. GREENING
YELLOW TRANSPARENT :: GANO

are money makers in that territory. Plant the kinds that pay best.

Harrisons' Trees are budded from bearing orchards. They are true to variety.

We sell only trees we grow. Every tree we ship is clean, straight, healthy.

Get our 1914 Catalogue. All about trees for all sections. Fruit, ornamentals, shrubs, roses.

T. J. DWYER & CO., ORANGE COUNTY NURSERIES, Box 1, Cornwall, N. Y.

Ox-power for Spraying.

Talk about your gasoline, compressed air, or hot-air outfits in spraying, if you like. "There are others." It's always desirable to have good power behind the nozzle, and in front of the spraying machine, but it rarely pays to go in debt for the outfit. There are all sorts of contrivances for doing the work. We saw a case once where a woman was hauling a hand cart. On this hand cart was a tub containing the spray liquid. The head of the family was working the pump, and one of the boys, a lad of 12 or more, was holding the nozzle, with

AN OX-POWER SPRAY RIG. FIG. 188.

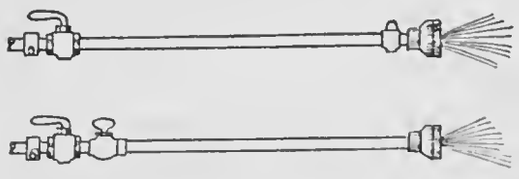
both father and mother telling him what to do.

In another case we have seen a man with a half barrel on a wheelbarrow, pushing it along as well as he could; and when he came to a small tree, working the pump with his right hand and trying to hold the nozzle with his left hand. While he was doing this, his wife and daughter sat on the piazza telling him what to do, and reminding him that he was not putting power enough into that pump. These ladies even failed to have the grace to bring father a cup of hot coffee and a plate of doughnuts as his back gave out. We could give 50 illustrations of the strange applications of power for the spraying machine.

One not so strange, but still effective, is pictured at Fig. 188. Here the patient ox has got into the game, and he is hauling the spray wagon through the orchard. The boy works the pump, and the man does the final job of aiming the spray. This job of spraying is well done, and produces good fruit. Let no man say that he cannot put spray on his trees in the face of this picture, and the illustrations we have given. The time is now ready to roust out the man of the house, the ox and the power sprayer, and give the trees their dose.

Valves in the Spray Rod.

I enclose sketch of spray rod attachment which I intend to use this Spring. Everyone who has had spraying to do knows that unless extreme care is used in straining the spray mixture, some particles will get into the spray tank that are too large to pass through the nozzles. Then the nozzle has to be taken off and cleaned. After closing the hose valve, when the nozzle is clogged, the pressure remains in the full length of the spray rod and there is enough spray mixture in it to soak the clothing and hands of the operator when he unscrews the cap of the nozzle. If the hose valve leaks a little, as many of them do after some service, the spray keeps coming while the nozzle is being cleaned and put on again, giving the operator a second wetting. To enable the operator to do this work without getting wet with the spray, I will place a valve next to the nozzle on the spray rod. This valve is closed after closing the hose valve, the nozzle may then be cleaned with dry hands.



VALVE IN SPRAY ROD. FIG. 189.

If I find that the added weight of this auxiliary valve makes the rod too heavy, I shall place this valve next to the hose valve, as shown in lower sketch. When the valve is placed here and closed, the plug is turned so that the rod is drained through the hole in the side of the valve body. There will be no wear on this valve, as it remains open all the time except when the nozzle is being cleaned. I know that the hose valve could be made to do this work, but the constant use would cause it to leak, and besides a stop would have to be arranged for the lever, to prevent the operator moving the valve too far or in the wrong direction, for you know he does not look at the valve when opening and closing it when spraying.

Illinois. CHARLES HEAD.

"FATHER," exclaimed John, vigorously, "why don't Quakers take off their hats?" "Because, my son, it is their belief that to remove their hat is a mark of respect that they think they should pay to no man." "Well," remarked the boy, after a moment's silence, "how do they manage when they have to have their hair cut?" —Melbourne Leader.

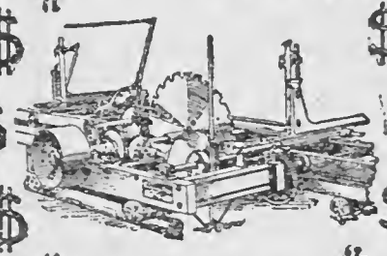
COUNT THE DOLLARS IN YOUR TREES



Go over to the wood lot and size up your trees. Every 16-foot log averaging 14 inches thick will make 100 feet of good lumber. Ten such logs make 1000 feet of lumber worth from $25 to $40 (our book tells.) An "American" Saw Mill will saw them at a cost of $4 to $5 per 1000 feet. You have the teams, the time and the engine. It will pay to get the dollars out of those trees. You can do it for your neighbors, too—more profit for you. All you need is an "American" Mill—so simple anyone can run it, so strong it lasts for years. An 8 H. P. engine will cut up to 2500 feet per day. Farm lumbering is explained in our new book No. 26 Sent free. Ask our nearest office.

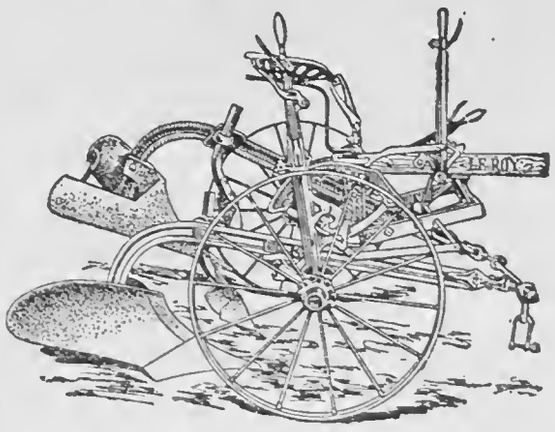
What One Farmer Says About
The Light Draft Le Roy Sulky and Small Horses.

Le Roy Plow Co.,
Le Roy, N. Y. Dec. 18, 1913.

Gentlemen:—When looking for a sulky plow I watched my neighbors as they had different kinds and I made up my mind the Le Roy was the kind for small horses and as I have used your walking plows and found them all right, I bought one and am well pleased with it. I broke up four acres that never was plowed before and it worked fine.

Yours truly, William Redmore,
Cameron Mills, N. Y.



The Le Roy handles just as easily in small fields as large and will turn the same size furrow as any other with much less horse power.

MANUFACTURED BY
The Le Roy Plow Co.
LeRoy, N. Y., U. S. A.

Every Farmer likes the LIGHT DRAFT LE ROY because it works so easily, does such good work in a large variety of soil, is easy on the horses, pays for itself so quickly and saves waking 7 miles to the acre.

The Le Roy is guaranteed to do better work than any other reversible sulky plow made. Ask your dealer for a trial or write us.

We are not in a Trust or Combine, but are a strong Independent Co.

FROM OUR FARMS TO YOURS

UNEMPLOYED WORKERS FOR FARM HELP.

On March 16, 80 unemployed men and women left New York City for Fonda, in search of employment as farm helpers. This was the first experiment on the part of the State in trying to locate the city unemployed in the country. Several nationalities were represented in this party, as well as people from all over this country. Most of them were persons who had drifted to New York in search of work, and either failed to obtain employment, or lost the jobs which they had secured. They were generally of good character, healthy and strong, and honestly in search of work. They all seemed to understand what they were doing, and that there was no "picnic" ahead of them, for the managers of this movement seemed to have shown good judgment in selecting the helpers. The journey from New York up the river was enlivened in various ways. A quartet of singers from New Jersey, South Dakota, Sweden and Brazil gave an impromptu concert, and other singers from Holland, Norway, England, Scotland and France joined in. These songs and stories whiled away the time. There was practically no drinking or carousing, for this first carload of workers realized what they were doing, and were honestly searching for work. On arrival at Fonda they were taken to the court house, where they were fed and cared for by the town.

On the 17th, farmers from the surrounding country came in to look these workers over, and engage them if found desirable. It was a bad season for the farmers. The roads are badly drifted in spots, and bare in others, and it was very difficult for the farmers at any distance away to get into town. It was also rather early for hiring farm hands, as the season is backward and regular work for the Spring has not been started. Most of the men were engaged, however, promptly. A few who failed to find places were taken elsewhere, so that in the end they all found work. Our reports from farmers thus far indicate that these workers were quite satisfactory. Naturally at the beginning of such an enterprise some farmers would be suspicious of city help, and would hesitate to employ them, but this first lot of workmen seems to have impressed the farmers around Fonda favorably, and the experiment may certainly be called a success. Other lots of men will be sent away from time to time to various parts of the State. It is a new enterprise, and a worthy one, and the State is well justified in taking hold of the matter, and trying to bring the laborers to the farm, rather than to leave individual farmers at the expense of time and money of going to the city, one by one, to pick out their helpers.

It would be quite remarkable if such an enterprise as this were to start off from the very beginning as a complete success. There are many things to be adjusted and understood by both sides. We want to hear from farmers who have employed these men. We would like to have them tell us frankly just what satisfaction these workmen are giving, and anything else about the matter which other farmers ought to know. This is the best way to get the desired information before the public. In theory the scheme is an excellent one, and the first experience with it at Fonda was very satisfactory. It will be a great blessing both to honest workmen in the city, and farmers who need help, if this plan can be developed and made fully practical, and the best way to make it so is to obtain the experience and advice from practical farmers who have employed this help.

NEW YORK STATE NEWS.

A LAW NEEDED.—It would seem that there should be a law to prevent diseased cows from being sold and slaughtered for food. The other day 325 cattle were unloaded in the Albany stockyards, which were examined by Dr. O'Leary, of the Federal Bureau of Animal Industry, and six were found to be infected with tuberculosis and were ordered to be kept within the State. These animals were thin, bony and emaciated, with sores on udder and about the head. In response to a query of the man in charge of the cattle, Dr. O'Leary told him he could do anything he wished with them but ship them out of the State, that he had no further jurisdiction. There is no law, he said, to prevent anybody from purchasing these animals, butchering them and offering the meat for sale in the markets. The Federal Government has no authority beyond detaining such stock where it is found, but where the power of the government ceases there the authority of the State and city ought to begin. It is a serious and alarming condition, he is reported to have said, to which the city and State should wake up. There are some slaughter houses inspected by the government, but such inspection is not compulsory. Commissioner Huson's agents soon got onto their job and killed two of the six cattle, "embalmed" them in oil and sent them to the "crematory" for fertilizer.

FARM HIGH SCHOOL.—A project is on foot to establish an agricultural high school at Wyoming, about 40 miles from Rochester. The people there are said to be willing to donate a site and a suitable building for the purpose. Dr. W. H. Dexter of the Agricultural Department at Washington has been there to look over the situation, and is reported as being favorably impressed with the proposition.

STATE FAIR PREMIUMS.—It has been announced that the State Fair Commission will have $4,000 more at its disposal for agricultural premiums this year than last. The principal beneficiaries of the increased premium money will be the cattle, sheep and poultry departments. The appropriation for the racing features this year is $5,000 more than last.

CAYUGA FARM BUREAU.—Plans are under way for the organization of a Farm Bureau in Cayuga County. J. R. Teale of Lysander has been engaged as manager at a salry of $1,800 a year. The County Grange is co-operating and the matter was discussed at the recent meeting of the Grange. A scheme of co-operative farming was outlined by Marc W. Cole of the Department of Agriculture. A meeting will be held soon at the courthouse in Auburn for further consideration of the Bureau.

COMPENSATION COMMISSION. — The Workmen's Compensation Commission recently established includes the following members: Robert E. Dowling, New York, chairman, salary $10,000 a year; John Mitchell, Mt. Vernon; Dr. Thomas Darlington, New York; J. Mayhew Wainright, of Rye. The salaries of the three latter are $7,500 each. There is still one other commissioner to be appointed. The nominations were promptly confirmed by the Senate.

MUNICIPAL MARKET. — While others have been talking the Syracuse Chamber of Commerce has been acting in the matter of municipal market. At a recent meeting of that body a plan was outlined for a city market, to cost not more than $300,000, or if the city was not ready to go into the market business, then a private plant under municipal control was suggested as the next best thing. A report submitted to the Chamber of Commerce by a committee appointed last December provides that the market shall have ample inside sanitary stalls, with cold storage and refrigerator equipment, also accommodations for producers.

WAYNE COUNTY FRUIT.—Reports from Sodus and other sections in Wayne County are to the effect that the moderating weather is assisting in moving of cold storage apples. Choice Baldwins are commanding $5 a barrel on track, and many sales have been made at a higher figure. Some fancy Greenings have been sold at $5, and one car of gilt-edged fruit went at $7. Estimates on the damage to fruit, especially peaches, are as discouraging as ever, and the total estimated loss is placed by some at $1,000,000. Last year more than 4,000 cars of peaches were shipped from the belt, valued at $2,000,000. Up near the lake the buds are in better condition than further inland.

ARKPORT PRODUCE EXCHANGE.—Another coöperative association under the new law has been organized at Arkport with Frank H. Latimer as president and Clayton H. Rollers as secretary and treasurer. This is intended to be principally a buying exchange where farmers may combine their orders for farm supplies and machinery. The principal produce which this exchange expects to sell is potatoes, and they hope to effect some sort of a connection with the Long Island potato growers to their mutual advantage.

CONVICT LABOR ON ROADS.—The Assembly has passed the bill permitting the use of convict labor on State highways. The bill has already passed the Senate, and it will probably become a law in a few days. It is said that the bill has the approval of the Superintendent of State Prisons.

CATALPA CASE APPEAL.—The appeal of Bert Walton of Indianapolis, Ind., the Catalpa tree salesman, was heard in the county court at Batavia on March 16. It will be remembered that a verdict was found against him in justices' court in his suit to recover for Catalpa trees sold to James A. Pettibone, a farmer of Alexander. Decision was reserved. On the outcome of this appeal will depend whether many similar suits against other Genesee County farmers will be dropped or not. The attorney for Walton, Mr. Webster, is said to have made the statement that the gathering of 300 or 400 farmers throughout the three days' trial of the case in the justices' court was calculated to unjustly influence the jury, and that the farmers composed "an angry mob, which had threatened to endanger our lives." Attorney Webster should carry a gun.

Window Flowers for Easter.

Would you tell me how I can raise flowers for the Easter markets? I have plenty of time to work at them, I have a nice sunny room I can raise them in, as I do not want to spend much money to get a start. Tell me where I can get a market for them, and if you think it would pay. M. G.
New Jersey.

M. G. would very likely meet with disappointment in trying to grow Easter flowers in a sunny room. To grow tulips, hyacinths and other bulbous stock to sell in competition with the florists' stock would require a hotbed or preferably greenhouse. Is there no demand in your home town for cabbage, tomato, pepper, eggplant, and similar vegetable plants? Vegetable plants could be grown much more satisfactorily than flowers, by planting in shallow boxes containing about two inches of soil and transplanting about two inches apart each way. Cabbage seed could be sown January 1 to 15, transplanted soon as large enough, and put under a sash outside March 1 to 15, when tomato, eggplant, and pepper could be ready to transplant. The cabbage in frames should be protected at night for first week to 10 days if weather should be cold. To grow flowers try to build a small greenhouse, but the room to start them and a few sash to harden and hold for sale would make a good combination for vegetable plants. Boxes would have to be turned every few days, or plants would draw crooked and spindling. Keep temperature 50 nights, 60 to 65, days. ELMER J. WEAVER.

Mixing Lime and Fertilizer.

I have a large lawn here and am going to lime and fertilize it with pulverized sheep manure as soon as I can. Would it be right to mix the fertilizer and lime together and apply, and when is the best time to do it? The lime is the regular agricultural lime. W. J. K.
Pittsford, N. Y.

On general principles we would not advise mixing the lime with any form of organic manure, like sheep manure or hen manure. It is true that ground limestone would not be likely to cause any loss of ammonia through such a mixing, but we do not know just what form of lime you have. It may contain a quantity of burnt lime, and if it does mixing with the sheep manure would cause the loss of some of the ammonia. You will gain nothing by mixing except the time spent in applying the lime, and we would rather put them on separately. An application of lime to a lawn, without working it into the ground in some way, is not usually very effective, for lime to give its best results should be worked thoroughly into the soil. We would use the lime and manure as soon as the ground is thawed out.

Ground Limestone or Burned Lime.

I expect to sow seven acres of oats on corn stubble. Before it was plowed for corn it was old meadow land. Which would you prefer to sow, ground limestone or burnt lime? If the ground lime is used in a drill with the grain, how much would you sow to the acre so as not to injure the grain? If the burnt lime is used, how much of that to the acre? A. E. M.

It depends largely upon the soil. A stiff, hard clay soil will do better on slaked lime—one ton to the acre. A lighter and more open soil will generally be better suited with ground limestone—two tons to the acre. The usual rule is to apply twice as much of the limestone as of the burned or slaked lime.

Greening Trees and "Pollenizers."

I am planting orchards of Greening apple trees 20 feet apart each way. In order to make sure that the flowers are properly fertilized I think of planting Baldwins every fifth row, which would give four rows of Greenings to one of Baldwins. Would this be enough, and will this interplanting be necessary? B.

It is our judgment that in some sections R. I. Greening is assisted by having another variety with it to act as a pollenizer. For this reason we have planted four rows of Greening, four of Baldwin, alternately. I do not like single rows of any variety, because there is too much work attending picking in single rows. Also, if there is any difference in spraying developments it involves extra work. I should make the block of Baldwins at least three rows wide. The Greening block may be left five or even six rows wide. SAMUEL FRASER.
Livingston Co., N. Y.

In my experience I have found that weather conditions during blooming time, late frosts, rain and continued cold have more to do with the setting of fruit than cross-pollination. Yet in order to take advantage of possible cross-pollinating I have planted the permanent varieties in blocks of four to six acres. This is more convenient in picking time than alternate rows. I would not advise planting Greenings 25 feet apart, as they are large-growing trees and in a few years would be too close together to admit sunlight. My plan has been to use a filler with the permanent trees, this filler to be a smaller-growing, early-bearing variety, blossoming at the same time. The permanent trees are 56 feet apart, with one in the center of the square; the fillers make the rows 28 feet apart. The rows run north and south and after taking out fillers, each tree gets the same amount of sunlight. F. W. CORNWALL.
Wayne Co., N. Y.

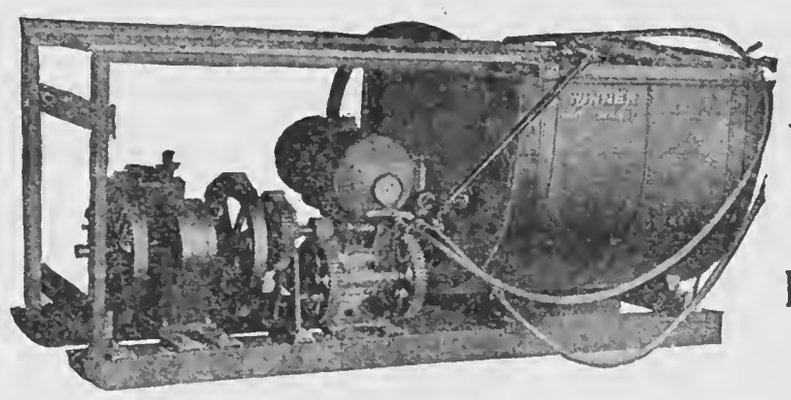
Greening orchards of considerable size, so far as my knowledge goes, have not shown the need of cross-pollination. It is possible, however, that in years when the pollination is poor anyway the Greenings would set a better crop with some other varieties adjacent to furnish pollination. I have reason to think that some years at least this is true with Ben Davis. I am sure that I am safe in saying, however, that every fifth row would be enough Baldwins to pollinate the Greenings. Unless the soil is very different from any with which I am acquainted, I would suggest that the inquirer is planting his Greenings much too close. It would be better to have his Greenings 40 feet apart or more with some early-bearing varieties like Rome Beauty as fillers. W. H. CHANDLER.
Cornell Agricultural College.

My experience with the Greening apple for 30 years past is that it is practically self-fertile. That is to say that it needs no other variety to fertilize its bloom. We have a solid block of five acres of Greenings, and joining these on the south are some mixed varieties, including Baldwin and King. The Greenings on the extreme north side of the orchard seem to bear just as well as those on the south side. Our prevailing winds are northwest and south-east, so I think there are portions of these Greenings that are never fertilized by any other variety, and all seem to bear equally well. I should not set an orchard in the way mentioned by your reader. I should leave out the Baldwins entirely if cross-pollination were the only reason for setting them. But if I wanted the Baldwins for the Baldwins' sake I should set them all together say in the center of the orchard with the Greenings on either side. Our Greenings are set 30 by 32 feet and they began to crowd when 20 years old. I would never set them again less than 40 feet. W. A. BASSETT.
Seneca Co., N. Y.

Ashes With Fertilizer.

I have a quantity of tie-wood ashes, which I wish to use for fertilizer. What quantity of nitrate of soda, and phosphoric acid should I add to make a fertilizer for general use, such as potato, corn and garden truck? C. A. H.
Derby, N. Y.

These ashes from railroad ties will vary considerably, as they are usually exposed more or less to rain and snow. As a general rule, however, for one ton of the ashes you can use for garden truck 300 pounds of nitrate of soda, and 500 pounds of acid phosphate. For corn we should use 200 pounds of nitrate, and 500 of the phosphate. Ashes do not make a good fertilizer for potato, owing to the lime which they contain. Do not try to mix the chemicals with the ashes.



Let the WINNER SPRAY OUTFIT MAKE MONEY FOR YOU

The Winner Spraying outfit delivers 6 gallons of liquid a minute at a pressure of 175 lbs. It is made up of our well known high grade, high class Excelsior engine. The spray pump is built like a watch throughout, all parts are interchangeable, of the highest grade of material and workmanship, and will last a lifetime. The tank is of cypress with rotary agitator, comes completely equipped, ready for work, either on wheels or skids. Tell us your spraying conditions and receive our special proposition.

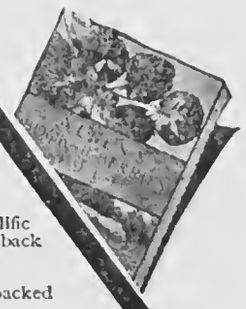
Allen's Book of Berries for 1914
This book is profusely illustrated and full of valuable information to fruit growers. Tells how to plant and cultivate Strawberries and other small fruits. It also lists and describes Allen's True-to-Name Blackberries, Raspberries, Currants, Grapes, Asparagus, etc. Every gardener, farmer and fruit grower should have this 1914 Berry Book. Write today for **free** copy.
W. F. ALLEN 72 Market Street, Salisbury, Md.



THE PRUNING OF APPLE TREES.

PART IV.

The Grimes apple gives very little trouble, as it is not a rapid grower and is spreading in its habits of growth. Care must be exercised in keeping the center open and preventing the crowding of the branches.

There is much discussion as to the height to start the head. Some say one to two feet high; others say take off the lower limbs, as they interfere with cultivation. If the orchard is a small one and there are no regular orchard tools with which to do the work, it would be best to head not higher than three feet. This will permit the use of any ordinary farm tool needed in the cultivation, and still would not be too high for profitable pruning, spraying and gathering of fruit. Where the size of the orchard makes it profitable to buy special orchard tools, the trees will be better in every way if headed as low as 12 to 18 inches. The lower the head, the less damage there will be from wind, and the cost of spraying, pruning and picking of fruit will be less.

There are several diseases which have to be considered in the pruning of the apple trees. The pear blight, both on twigs and in the bark, has already been mentioned, with the treatment given; pruning is the only effective method of combating this disease. Great care should be exercised in preventing spreading the disease with the tools. Corrosive sublimate is a dependable disinfectant. Black knot and bitter rot cankers are best controlled by the same methods. There has been little trouble from these two diseases except in Red Astrachan and a local variety known as the Democrat.

There are several reasons for pruning or disbudding: First, to modify the vigor of the tree. Second, to produce larger or better fruit. Third, to keep tree within manageable shape and limit. Fourth, to change the habit of the plant to more or less fruit or wood production. Fifth, to remove superfluous or injurious parts. Sixth, to facilitate spraying and harvesting. Seventh, to facilitate tillage, and to train to some desired form. After reading over all the information obtainable, then go ahead and consult the tree. Study its needs carefully, then select the best grade of tools possible to get, and then go slow. It is sometimes easier to bring a limb back to health and vigor than to produce a new limb. The lower limbs will bear fruit if they can get sunlight and air. Above all things avoid extremes and advice without reason. If a man can't "tell why" then be careful how you follow the advice. R. B. GILMAN.

New Jersey.

Canada Peas Before Tomatoes.

Would it be a good plan to fertilize and sow Canada peas in March to turn under first of June, on ground where I intend to set tomatoes for canning factory use? Would the tomatoes make use of the nitrogen gathered and fixed by the peas? F. L. M.

Portland, N. Y.

In this case we should use a moderate amount of fertilizer on the Canada field peas, and also use oats in the combination. The oats will not add any nitrogen, but they will add humus, which most soils need. At the right time plow these oats and peas under, and use a dressing of lime. Your tomatoes will then have the benefit of the fertilizer which was added to the peas, and also of the nitrogen gathered by them. This plan of using the fertilizer upon a manurial crop is usually a good one, as it produces an extra yield of the crop, and, of course, that means more nitrogen taken from the soil, and more humus at the same time.

Seeding Alfalfa With Oats.

I have a couple of acres I wish to seed to Alfalfa. I sowed some last August and it is doing very well, had a good stand. I sowed oats in the Spring, cut the oats in July and cultivated vigorously, liming, inoculating and sowing. It came up well, but mixed with a vast amount of weeds, wild radish. This will doubtless disappear in the Spring. I have found it to be an annual weed and will be crowded out. I should like your views regarding the two acres I propose sowing. Half of it I seeded with rye and half with clover. The clover will probably be Winter-killed. The two acres have been in grass about four years, with no fertilizer put on in that time. I thought to fertilize a little with the rye and clover. I propose to do as follows and would like your advice: Turn under the soil in the Spring, lime it pretty thoroughly, inoculate it with Alfalfa soil and sow oats and Alfalfa together; cut the oats in July. If the Alfalfa comes up could probably get a cutting of that in August, and it would be up high enough to be ready for Winter. Would this, in event of success, be saving the great work of cultivating for a month and the growth of our vast quantities of weeds? Am I proposing something practical? Should I fertilize after plowing under the rye and such clover as may not be killed? If so with what? Manure is very high priced. Do you suggest anything better than oats to sow with the Alfalfa? W.

New Canaan, Conn.

We think it doubtful if in your latitude Spring seeding of Alfalfa with oats will be best. We have found August seeding with no nurse crop with the Alfalfa better. We should seed the oats alone, or with Canada peas, and cut this crop in early July. Then work the soil thoroughly and seed the Alfalfa alone, using the inoculating soil and also 350 pounds fine bone and 150 pounds muriate of potash per acre. While this will mean more labor and expense than the Spring seeding with oats, we believe it will pay.

SAFETY FIRST

You never bought better tires than you buy in Goodrich Tires this year

We never made tires as good as we are now making them.

❖ ❖ ❖

This is simply for the reason that in all our forty-four years of manufacturing experience our motto has been "Progress and Efficiency."

❖ ❖ ❖

Longer service and more satisfaction to tire user has been our watchword.

❖ ❖ ❖

We have not only been pioneers in perfecting and devising the best means to put mileage and quality into rubber and fabric, but we have been the pioneers in bringing tire prices to their present low level and raising the standard of quality.

❖ ❖ ❖

With us it has been a history of better raw materials, improved methods—higher quality and lower price.

❖ ❖ ❖

Today Goodrich leads in *quality*. We set the standard by which all other tires are judged.

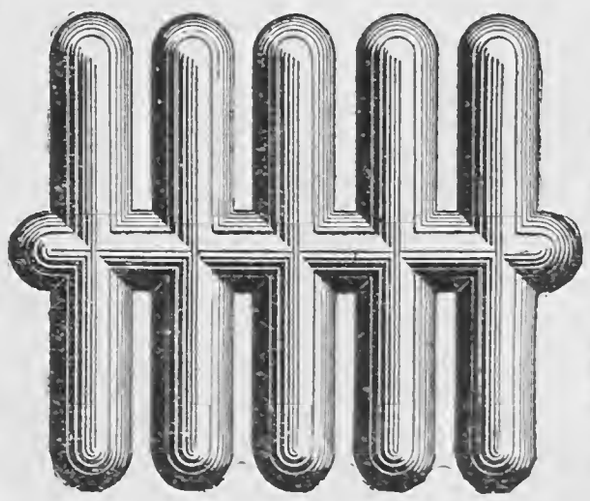
❖ ❖ ❖

All this in addition to the pleasing sense of security which you have when you equip your car with Goodrich Safety Tread Tires.

The Accepted Standard

Goodrich Safety Tread Tires

Best in the Long Run



The Goodrich Safety Tread
Five Bars and a Crosstie
The "Safety First" Symbol

The quality of Goodrich Tires today is the standard by which all other high grade tires are judged. That is because they represent perfection of tire-making and tire-knowledge—which gives Goodrich Tires leadership.

Just the unit-group of bars and crosstie which brace and balance the strain on the tire so that the Safety Tread runs as a smooth tread does and gives more actual service and mileage.

Here are the prices on the best tires ever produced in the Goodrich factory:

Size	Smooth Tread Prices	Safety Tread Prices	Grey Inner Tube Prices	Size	Smooth Tread Prices	Safety Tread Prices	Grey Inner Tube Prices
30 x 3	$11.70	$12.65	$2.80	34 x 4½	$33.00	$35.00	$6.15
30 x 3½	15.75	17.00	3.50	35 x 4½	34.00	36.05	6.30
32 x 3½	16.75	18.10	3.70	36 x 4½	35.00	37.10	6.45

EVENTS OF THE WEEK.

DOMESTIC.—Six blocks of the water-front were destroyed at Portland, Ore., March 12, by a fire of unknown origin, the loss being estimated at $1,000,000. Columbia Dock No. 2, Montgomery Dock No. 1, the steamships Cricket and Glenroy and much other property were destroyed. The Cricket, which was laden with asphalt, burned fiercely. Firemen cut her loose, but the big ship instead of going to the centre of the stream, floated along the docks, spreading the flames. The Glenroy caught fire nearly as soon as the Cricket. It was with diffieulty that the Chinese crew was rescued and a number of them jumped overboard to escape the flames. They were herded by the Federal authorities to prevent their escape.

Leading dry-goods merchants of New York have united to find employment for 2,300 persons thrown out of work by the failure of the two Henry Siegel department stores. In addition to the loss of employment, Siegel's financial operations, conducted through his private bank have caused 800 of these people to lose all their savings, and also absorbed the sick benefit fund of these workers. It is said that the bank accepted a deposit of $4 on account of the fund on the day the receiver was appointed—the dimes of 40 girls who were getting $7 to $8 a week.

Directors of the United States Express Company voted, March 13, to wind up the company's affairs and go out of business. The first direct result of the Government's parcel post competition and the resulting reduction of 16 per cent. in express rates will be the throwing out of work of 15,000 employees of the United States Express Company when its liquidation is completed. There are about 2,000 employes of the company in New York city. The United States Express Company has no pension system. Its yearly payroll is about $6,000,000.

The Kentucky lower house of the General Assembly put itself on record, March 13, as being absolutely opposed to granting the voting privilege to women by voting 51 to 29 to defeat an amendment to the State Constitution allowing women to vote. The Senate will now get the measure, but its defeat is certain there and women have given up the fight for the present.

The United States Circuit Court of Appeals suspended, March 16, the injunction restraining the Eastman Kodak Company from selling films manufactured according to the Goodwin process until the court determines the right of the Eastman company to sell all the films it now has on hand before making an accounting to the Goodwin Film Company. The Circuit Court of Appeals recently sustained the decision of Judge Hazel in the Federal District Court of Buffalo that the Eastman film was an infringement of the Goodwin process, invented by the late Hannibal Goodwin, an Episcopal minister. J. J. Kennedy, attorney for the Eastman company, asked the court to allow his clients to sell all the films they had on hand. This, he said, would be to the benefit of both parties to the litigation, since the films, if not sold within a month or two, would be unmarketable.

College Hall, the main building of Wellesley College and one of the oldest of the group, was destroyed by fire, March 17, early in the morning. Two hundred and fifty students, 50 instructors and 50 servants, who roomed in the building, were roused from their sleep and all marched out safely. That none of the 350 occupants was killed or injured is attributed to the perfect working of the many times rehearsed fire drill. The girls lost nearly all their belongings. The loss to building and contents is estimated at $900,000. President Ellen S. Pendleton announced that college would be closed until after the Easter recess.

After the summing up by attorneys in the trial, at Philadelphia, of Capt Osmyn Berry of the steamship Nantucket, in connection with the Monroe disaster, Capt. R. A. Sargent, chairman of the local board of steamboat inspectors, said in a report that Capt. Berry should be exonerated and that charges of negligence and incompetence should be made against Capt. Johnson of the Monroe. D. H. Howard, the other member of the board, declined to concur in the report, which will be submitted to the Department of Commerce for review.

Three men were crushed to death and five were injured in a daylight collision between the Lackawanna Railroad ferryboat Ithac, and a Jersey Central freight car float in the Hudson River 600 feet off the foot of Chambers street, Manhattan, March 17. All the dead and injured were commuters in the men's cabin on the main deck of the ferryboat—eight of 700 who were crossing to Hoboken at the end of a day's work in New York. The float, towed by the tug Freehold, hit the Ithaca amidships. A protruding freight car bored into the men's cabin, wrecked it and then, when the tug backed away, dived to the bottom of the river. The accident occurred because neither the captain of the ferry nor the captain of the tugboat saw the other's craft in time, as an Erie ferryboat, bound for Jersey City, was crossing between them.

A complaint by Mrs. John Larson, Oregon's only woman Mayor, has resulted in the arrest of her own husband, a saloon keeper, on the charge of selling liquor to a minor at Troutdale.

The west wall of the Missouri Athletic Club building, towering high above the ruins of the recent fatal St. Louis fire, tumbled over in a high wind, March 17. It crashed down through the roof of the four-story building occupied by the St. Louis Seed Company, killing three persons there and burying a score or more who were in that building or working in the ruins to the rear of it. The wall was 17 inches thick and had been regarded with apprehension since the fire.

The Red Cross Line steamship City of Sydney went aground on the rocky ledges near Sambro Head, just outside the entrance to Halifax harbor, N. S., March 17. Her 13 passengers and part of the crew were taken off by tugs and finally Capt. David McDonald and the rest of the crew of 40 men were rescued. It is believed the steamer will be lost. She carried a cargo valued at $300,000, fully insured.

A suit to break the Lehigh Valley Railroad's alleged anthracite monopoly was begun by the Government in the United States District Court at New York, March 18. In a petition filed by Frederic R. Coudert, Special Assistant Attorney-General, the Lehigh, its directors and subsidiary companies are accused of violating the interstate commence act and the Sherman anti-trust law. An injunction to prevent them "from further restraining, monopolizing or attempting to monopolize trade and commerce in anthracite coal" is sought. The Government also asks that the railroad company be enjoined from carrying coal in which it has an interest. It is a dissolution suit which if won by the Government will compel the Lehigh Valley Railroad Company to dissociate itself from the coal companies which, according to the petition, it controls.

The New Jersey Assembly passed, March 18, a resolution asking the Federal Government to build the proposed $40,000,000 bridge between New York and New Jersey.

POSTAL CHANGES.—A change has been made in the rules governing the parcel post that is expected to result in a much larger use of the mails by farmers. Postmaster-General Burleson has announced that hereafter butter, eggs, fruits, berries, vegetables, dressed poultry and other articles entering the parcel post running fron. 20 to 50 pounds in weight may be packed in boxes and crates similar to those used when shipment is made by express. Heretofore such parcels had to be in such form that they could be placed in mail bags. Under the new rule farm products such as those enumerated will not be put in mail bags. Packages of these articles weighing 20 pounds or less are required as heretofore to be packed in such manner as to be safely handled in bags with other mail matter. March 16 the Postmaster-General signed an order providing that the sender of a parcel post package on which postage at the fourth class, or parcel post rate, is fully prepaid may place a communication in an envelope prepaid at the first class, or letter rate, and attach it to the parcel, the envelope being addressed to correspond with the address on the parcel. The envelope must be tied or otherwise securely fastened to the outside of the parcel in such a manner as to prevent its separation from the parcel.

FARMOGERM
HIGH BRED NITROGEN-GATHERING BACTERIA for CLOVERS, ALFALFA, BEANS, and OTHER LEGUMES
A NOTE OF WARNING
TO the small grain planter. Wheat, oats and barley are wearing out your soils and leaving only the stubble behind in return. We can tell you how to make stubble richer than manure. This will make money for you. Corn is a voracious feeder. Learn how to satisfy this appetite at the least expense of time and money. If you use fertilizer let us tell you how you can use twice as much at the same expense; also we can inform you how you can grow big crops without lime. If you are short of manure, we can give you a plan to get organic matter at least expense.
We can tell you if your soil is acid. If acid we may aid you to correct it without lime. All these things we have done for others and can do for you. Write us for free booklet No. 82.

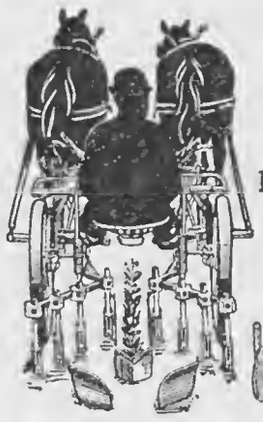
This is a practical every day time-, labor-, and money-saver. It combines in a single implement a capital seeder, an admirable single wheel hoe, furrower, wheel-cultivator, and a rapid and efficient wheel garden plow. Every owner of a vegetable garden can save the cost of this tool in a single season.

IMMEDIATE SHIPMENT GUARANTEED



No. 76
Planet Jr Pivot-wheel Riding Cultivator, Plow, Furrower, and Ridger
A wonderful implement in extensive cultivation of corn, potatoes, etc. Light in draft, simple and strong in construction and comfortable to ride upon. Works rows 28 to 44 inches, and cultivates crops until 5 feet high.

No. 11
Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake
The greatest cultivating tool in the world for the grower of garden crops from drilled seeds. It has steel frame. The plow opens furrows for manure, seed, etc., and can be reversed for covering. The cultivating teeth are adapted for deep or shallow work and for marking out. Crops can be worked both sides at once until 20 inches high.

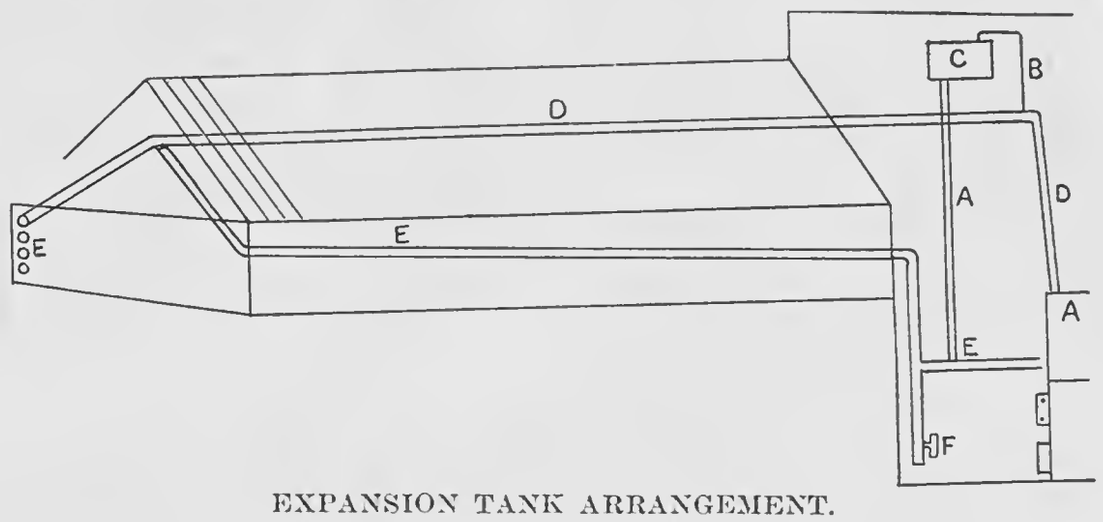
No. 72
Planet Jr 2-row Pivot-wheel Cultivator, Plow, Furrower and Ridger
Cultivates at one time two rows of potatoes, corn, beans, etc. in rows 28 to 44 inches apart. Works like a charm in check rows, crooked rows, and rows of irregular width. Can be equipped with roller-bearings, spring-trip standards, and discs.

Greenhouse Construction for Small Place.

PART III.

The trouble likely to be encountered in using a pipe heater is scale and sediments collecting in lower pipe, and eventually weakening the pipe at that point. This in a measure can be overcome by having the return pipes drop to bottom of cellar and have a blow-off cock at low point, which should be opened occasionally to allow sediment to be washed out of system. The flow and return pipes should be carried as direct as possible from heater to greenhouse and with as few bends as is consistent with the location of heater to house. As explained before, if house is nearly level carry the flow pipe directly from boiler to near top of house and place an air-cock at that point; then gradually descend to far end of house, at which point drop either to side walls or under benches, and continue the down hill method to boiler. Each system must have an expansion tank connected to a point on the return near the boiler placed higher than top of flow as outlined in Fig. 5. In the cut A represents heater; D flow pipe to high point of house; C expansion tank, which must hold one-twentieth amount of water in entire system and be connected as shown by small pipe A1 to return pipe E close to boiler. Return pipe E should be continued below entrance to boiler as shown and have a blow-off cock as shown at F, which should be opened quite often to blow sediment out, which will collect at that point. The air vent shown at B is a one-eighth inch pipe tapped into flow and extended over expansion tank and always left open, and will always keep the system free of air and will never require any attention. If only one house is built no valves will be necessary, but if two or more are connected together the flow or return pipes should have valves placed in them so as to have heat in houses under control.

In figuring amount of pipe to use for a temperature of 55 degrees with thermometer at zero outside, a house having 1,000 square feet of glass on roof, ends and sides should have about 275 square feet of pipe. If sides are exposed three or four feet 300 would be best, this would mean nearly 600 feet of 1½-inch pipe, 500 feet two-inch or 700 feet 1¼-inch. The flow and return pipe from boiler to greenhouse, if only one is used, would have to be 2½ inches in diameter to carry this amount of radiation. A house containing 3000 square feet of exposure would require three times amount of pipe mentioned above, and a 3½-inch pipe for flow and return to boiler; 4,000 feet a four-inch flow and return; 5,000 to 5,500 a five-inch flow and return.



EXPANSION TANK ARRANGEMENT.

For a house of 3,000 feet exposure using a pipe constructed heater of Fig. 3 style the grate should be at least 18x30 inches and heater should contain 12 pieces of two-inch pipe about eight feet long; six pieces of pipe on each side made up in two coils, with two returns entering heater at bottom and two flows leaving at top. If desired to leave fire six hours or more without attention 18x36 would not be too large for grate. Smoke flue should be 10 inches diameter.

Allow plenty of depth for ashpit, 18 inches not being too much, and place fire brick 12 inches or so high at side of grate up to lower pipe. Make ends of heater arch shape and allow return bends to extend slightly over each end for support, then place old boards on pipe and turn a brick arch over all. The boards eventually will burn out. In figure 4 the coil is constructed by using right and left ells on end of upright pipe, and using a right and left pipe from ell to top heater. This method is much more troublesome to make than Fig. 3 and no more efficient, but would last longer, as danger of sediment collecting in horizontal pipe would be obviated.

All lumber used in greenhouse construction should be cypress, and if posts are used red cedar sawed four inches square and set four feet centers or five feet four-inch centers will be satisfactory. All lumber entering roof construction should be painted with a guaranteed white paint, two coats, and a third applied after frame is erected. The best size glass to use is 16x24 A or B, double strength.

The sash bars to be placed 16 inches apart, and the rabbet on which glass rests to be filled with the best putty you can buy, *not the cheapest, but the best.* Start at lower edge and drive two nails in plate or sill, so they will slope lower edge of first light of glass; press first light into putty till most of it is forced out underneath. The second light is to lap over the first about one-eighth to three-sixteenths inch and upper end forced down in putty till nearly resting on wood, and so on till row is finished. Either a glazing point, sold by all seedsmen, is forced into the bar at lower edge of each light or zinc brads similar to shoe nails may be used. The point referred to is galvanized and will last quite a while, but the zinc nail or point will possibly last longer. If plenty of putty is used you will have a practically watertight job. An examination of all glass will show each light having a concave and convex plane. *Always* place the convex side up, as placing the convex side down will cause drip of condensation into house from center of light.

ELMER J. WEAVER.

Lancaster Co., Pa.

HANDLING SUNFLOWER SEED.—I have noticed at different times in farm papers articles on the raising and curing of sunflower seeds. Our way may be of use to someone. When drilling the corn, the last four rows across the field are reserved for sunflowers; this seed is substituted in place of the corn in the drill. It is then planted, worked and thinned, just as the corn. Late in September or early in October we go to the field in our one-horse farm wagon; one person walks down the rows cutting the heavy heads and throwing them in the wagon to the second person, who attends to the driving and cleaning, which is easily done. As the heads are thrown in the wagon they are cleaned with a curry-comb. It is surprising how readily the seeds drop out as the comb is passed to and fro over the heads. The empty heads are thrown in piles as we drive down the rows. Coming back the stalks are heaped up and burned if dry enough. The seeds are spread out in the wagon bed and stirred frequently during the rest of the day; toward evening they are put into large loose sacks and hung up in a dry cool place. They are ready for use in a very short time; in this way we do not have trouble with mold as some do. We find the seed very beneficial for our poultry, mixed with the scratch food.

Pocopson, Pa. C. B. T.

"WHAT'S the discussion?" "The boys had assembled to lynch a horse thief." "Well?" "But now a knotty point of jurisprudence has come up. Seems he stole an automobile."—Louisville Courier Journal.

"DEATH, TAXES AND The Mapes Manures Are the Only Three Things in This World I Am Sure of"

WROTE AN OLD CUSTOMER OF OURS

Passing by the first two, he and every other farmer certainly has every right to be sure of THE MAPES MANURES. They have been used for fifty years by the most intelligent, the solidest and most successful farmers, who have banked absolutely on

I. THE RECORD OF MAPES IN THE FIELD.

Our record in the field for the past fifty years is too well-known to require more than a mere reference. In this connection, "lest we forget," in the American Agriculturist's Prize Contest, open to the entire United States, the largest crops of Potatoes and Corn grown on commercial fertilizer alone were grown with Mapes; 669 bushels of Potatoes on one measured acre with the Mapes Potato Manure, and 213 bushels Shelled Corn on one measured acre with the Mapes Corn Manure.

II. THE MAPES RECORD WITH THE EXPERIMENT STATIONS.

We are equally proud of our record with the Stations. There may at times have been an occasional chance analysis which was not quite what we would have liked, and not fairly representative of our goods, but on the grand average, year in and year out, our record has been something to be justly proud of.

III. SAME FAMILY MANAGEMENT FOR THREE GENERATIONS.

Not only have the Mapeses continued successively in the business for three generations—grandfather, father and son—but the Lanes, who have been associated with the Mapeses from the start, follow the same identical record in the business, grandfather, father and son, successively. Could there be a better guarantee than this family management, with the element of family pride deeply involved, that everything has been done and will continue to be done to make the Mapes Manures as good as the knowledge of fertilizer science permits for the crops for which they are intended.

The Mapes Manures have never stood still but have been constantly improving as the knowledge of scientific plant feeding broadened and progressed.

"The Mapes business had its inception in the scientific research and experiments of Professor James Jay Mapes, and scientific research and experiment, coupled with the most exact practical experience, have been the dominating factors in the Mapes business to the present day."—The Florida Grower.

GARDEN PLANTING.

Will you tell me the earliest dates when I can plant a garden safely in Orange Co., N. Y.? I desire to plant the following vegetables: Spinach, lettuce, radishes, eggplant, tomatoes, carrots, beets, parsley, pepper plants (green), muskmelons, Summer squash, pole limas, string beans, corn (Golden Bantam, Country Gentleman). Of course I understand that a cold or very wet Spring would postpone the date just as reverse conditions might advance it.

The accompanying diagram represents things as fairly as I can, and it is drawn pretty close to scale. The garden is only for private needs, and I hope in time to bring it all into good fertility. It has a warm exposure, but afternoon shadows are thrown by the church, but not till the latter afternoon. I have on it two loads horse manure, a large quantity of decayed forest leaves, and will use about two bushels lime. The grapes are closely pruned and run north and south. Weeds are luxuriant in the arbor. Can I put any vegetables in the arbor? I had clover on the clay last Summer and I am loosening it with coal ashes. M. S. P.

Newburgh, N. Y.

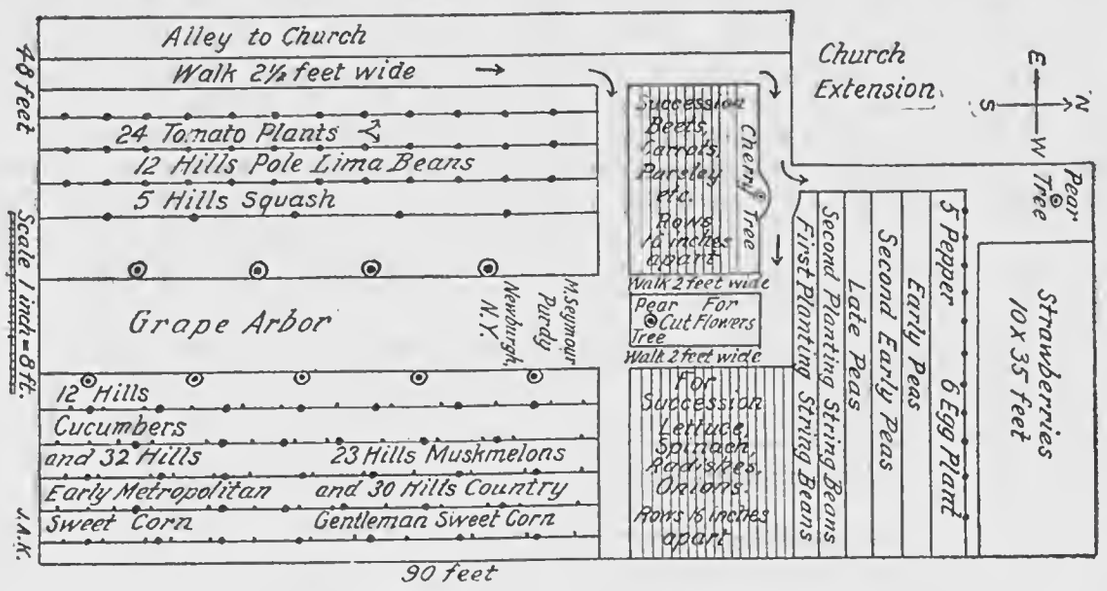
The hardier vegetables, such as spinach, carrots, beets, radishes, onions, etc., may be safely planted as early as the ground is in good workable condition, while beans, melons, squash, cucumbers and corn, should not be planted until the soil becomes warm, and the temperature at night does not go much below 55 degrees. Tomatoes may be set out at this time, but egg plant and pepper should be delayed until the temperature remains at 60-65 degrees at night. Early lettuce should be sown in the hotbed, greenhouse, or window garden about March first, and if the plants are properly hardened beforehand they may be safely planted to the garden as soon as they attain a height of two inches. Make a second sowing as soon as first plants are ready to set out, likewise a third sowing when second lot of plants are ready for setting out, and so on until the season becomes too far advanced and weather too warm for the lettuce to head.

Spinach may be sown every two weeks or so from the time the ground is fit to work until about the 25th of May, when the sowings must be discontinued until the middle of September, when one or two sowings may be made for Fall and early Winter use. Radishes may be sown as soon as ground can be worked, and successive sowings can be made every 14 to 18 days until about August 25. The Early Scarlet Turnip White Tip is the most satisfactory radish to grow for home use.

The round smooth peas may be sown as soon as the ground can be worked; they will bear considerable cold without being injured, both before and after they are up, but if there is no object in having them come on very early, it would perhaps be better to delay planting until the ground becomes somewhat warm, when the early, midseason and late varieties may be sown the same day. A pint of seed will sow about 36 feet of row. After the peas are cleared off, the ground may be planted to string beans, early sweet corn, cabbage or celery.

Of carrots and beets, make two sowings, about two months apart. Muskmelons, cucumbers and early and late sweet corn, may be planted in the same ground all on the same day. The hills for melons and cucumbers should have at least two shovelfuls of well-rotted stable manure well mixed with the soil. In the plan the rows are represented at 3½ feet apart, and the hills of melons and cucumbers six feet apart in the rows, which are represented by the large dots. The hills of corn are represented by the small dots which clearly illustrate the manner of planting. The tomatoes, pole limas, squash, peppers and eggplant should also be manured in the hill with old well-rotted stable manure. One shovelful to each hill of lima beans will be sufficient, while the tomatoes, etc., should have two good shovelfuls to each hill. In all cases, mix well with the soil.

The soil for lettuce, spinach, radishes, carrots and beets should be well enriched with heavy applications of well-rotted stable manure applied broadcast and spaded in and well incorporated with the soil. Five to six tons of well-rotted manure used broadcast and in the hills for such things as indicated, will not be too much for a piece of ground of this size. In all cases of vegetable production the ground should be quite rich, that the growth may be forced as rapidly as possible, particularly the succulents, as tenderness and flavor cannot be secured when the growth is tardy because of insufficient nourishment. Avoid manures containing shavings or sawdust, as they will quickly sour the soil and very materially reduce its productiveness. K.



PLAN FOR A HOME GARDEN.

Black Streaks in Potatoes.

I have some potatoes that appear perfectly sound on outside, but about 50% are black streaked inside, and unfit for cooking. Would these be satisfactory for planting, or would the crop be likely to be similarly affected? The variety is Irish Cobbler. I find that they are worse affected from one patch than another. Is it caused by fertilizing, or is it a disease? C. R. S.

Madisonville, Tenn.

Dark streaks and spots in the flesh of potato tubers, if scattered through the tissues and not confined to the vascular ring near the stem end, are usually an expression of a physiological trouble caused by unsuitable soil or by a lack of water at some period during growth, but if in well defined circles near the stem it is likely to be the result of infection with the Fusarium wilt or the late blight fungus, Phytophthora infestans, and should be rejected for planting stock. It is not definitely known whether potatoes affected with physiological brown-spot will produce as large a crop as healthy seed, but it is good practice to plant nothing but healthy-looking tubers, normal in appearance both inside and out. V.

Fertilizer for Early Tomatoes.

In your second article on early tomatoes a quick fertilizer was suggested. I am starting about 400 plants, and wish to know the very best fertilizer to put in the hill when I set them in the field about March 15? What do you advise?

San Diego Co., Cal. A. S. K.

When procurable, well-rotted stable or cow manure may be used with profit in this quantity of one good shovelful to the hill, or if the ground has recently produced a heavily manured crop, no further fertilizing will be necessary. In the absence of well-rotted manure use commercial fertilizer containing one to two per cent. of nitrogen, in the form of nitrate of soda, eight to 10 per cent. of phosphoric acid and six to eight per cent. of potash. Confine the use of this fertilizer to a strip about two feet wide along the course of the row, and use 600 to 800 pounds to the acre. K.

"Is that a man or a deer in the thicket?" "I guess it's safe to call it a deer," opined the guide. "If it had been a man he would have taken a shot at us by this time."—Washington Herald.

E. Frank Coe Fertilizers

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1914

RAISE CORN AT 12c A BUSHEL

This is what Mr. L. S. White of Connecticut did in **The Coe-Mortimer $500.00 Corn Contest in 1911.**

You remember that the competition was for the **most profitable acre of corn** raised in New England.

You probably remember also that **The Coe-Mortimer Company** had nothing to do with the judging or with the awarding of the prize. This was all done by a disinterested committee from the Massachusetts Corn Show, and the records were approved by The Director of The Connecticut Agricultural Experiment Station.

E. FRANK COE FERTILIZERS will help you to equal this record. Perhaps you can beat it.

It **cost** Mr. White just **$42.-50 to raise his corn.** (Official figures.)

The committee valued the 7733.9 pounds of stover produced at $8.00 per ton, amounting to $30.93.

The difference between $42.-50 and $30.93 is $11.57; and this is what it cost Mr. White for the 97.9 bushels of shelled corn (12% moisture) raised on his acre. (Official figures.)

Figure it out for yourself: 97.9 bushels of shelled corn cost $11.57—one bushel cost $11\frac{8}{10}$ cents; or in round numbers **12 cents per bushel.**

If superior goods and superior service interest you, write to us promptly.

$1,000.00 Prize Cup for Best Corn Raised in the United States. Won at the New York Land Show, 1911, by Mr. Wm. H. Dorin of Virginia, a user of Coe-Mortimer Fertilizers.

THE COE-MORTIMER COMPANY

APPLES ON LONG ISLAND.

PART IV.

Pound Sweet: trees vigorous, fruit yellow, russet, sweet, fair quality, large, not productive; not desirable.

Red Astrachan: trees good growers, fruit red, small to medium, fine quality, productive good for local supply; season Summer, not desirable for shipping.

Rambo: trees fair growers, fruit red, medium to small, good quality, season Fall; fairly productive, not desirable.

Red Bietigheimer: trees good growers, fruit very large, red, poor flavor, not productive, not desirable.

Red June: trees poor to fair grower, fruit red, small, fair quality, not desirable.

Rome Beauty: trees good growers, fruit red, medium to large, fair quality, productive, desirable.

Golden Russet: trees fair growers, fruit yellow russet, medium fair quality, productive, not desirable.

English Golden Russet: trees poor growers, fruit russet, small, poor quality, productive, not desirable.

Roxbury Russet: trees good growers, fruit yellow russet, large, fair quality, productive, desirable as a russet only.

Sweet June: trees fair growers, fruit red, small, sweet, prolific, not desirable.

Early Strawberry: tree fair grower, fruit red, small, fair quality, productive; not desirable; season Summer.

Autumn or Hale Strawberry: trees fair growers, fruit red, large to medium, fine quality, prolific, season early Fall, desirable.

Early Ripe: tree good grower, fruit yellow, medium to large, fair quality, productive biennially; not desirable.

Seek-No-Further: tree fair growers, fruit yellow, small to medium, poor quality, not desirable.

Senator same as Oliver, not desirable.

Scott's Winter: tree good grower, fruit red, small, acid, poor quality; productive, not desirable.

Stark: tree good grower, fruit red, large, good quality, early Winter, prolific, desirable.

Shackelford: trees good grower, fruit light red, poor quality, medium, Ben Davis type, not so good; productive, not desirable.

Smith Cider: trees good growers, fruit small, irregular, poor quality, prolific, not desirable.

Sutton: trees fair growers, fruit medium to large, red, good quality, prolific, desirable for main trees.

Stayman: trees good growers, fruit red, medium to large, fine quality, productive, desirable either as main trees or fillers; good Winter apple, keeps well.

Twenty Ounce: trees fair to poor growers, fruit red, large, fine quality, productive; season late Fall, desirable.

Tallman: trees good growers, fruit small, yellow, fair quality, prolific, not desirable.

Tetofski: trees fair growers, fruit red, large, fine quality, season Summer, productive, desirable.

Wagener: trees fair growers, fruit red, large, good quality, productive, season late Fall and early Winter, desirable as main tree or filler.

Winesap: trees good growers, fruit red, small, fine quality, productive, not desirable.

Wolf River: trees fair growers, fruit yellow and red, large, poor quality, shy bearer, not desirable.

Wealthy: trees good growers, fruit red, medium to large, fair quality, prolific, season Fall, desirable as a filler only.

Walbridge: tree good growers, fruit yellow, large to medium, poor quality, prolific, not desirable.

Wisner's Dessert: trees poor growers, fruit medium, fair quality, not desirable.

Williams: trees fair growers, fruit red, large to medium, good quality, prolific, season Fall, desirable.

Yellow Transparent: trees fair growers, fruit yellow, good quality, small to medium, prolific; season early Summer, desirable, best of its season.

Yellow Bellflower: trees good growers, fruit yellow, medium to large, irregular; good quality, prolific, not desirable.

York Imperial: trees good growers, fruit red, medium to large, fair quality, productive as trees get large and older; fair Winter keeper; desirable for main trees only.

Winter Banana: trees fair growers, fruit yellow, large to small, irregular, fair quality; prolific as grown by my neighbor Mr. Moses B. Griffing; not satisfactory as he is regrafting to Stayman.

I have grouped my apples as to varieties as follows for this section of country.

Best apples to plant: Baldwin, Ben Davis, Esopus Spitzenburg, Gravenstein, Grimes, Rhode Island Greening, Hubbardston, Jonathan, King, McIntosh, Rome Beauty, Sutton, Stayman, Twenty Ounce, Tetofski, Wagener, Williams, Yellow Transparent, York Imperial.

Good apples to plant: Black Ben Davis, Bismarck, Duchess, Delicious, Fameuse, Fall Pippin, Florence Crab, Fanny, Gano, Northwestern Greening, Jefferis, Maiden Blush, Missouri Pippin, Martha Crab, Northern Spy, Red Astrachan, Roxbury Russet, Late Strawberry, Stark, Winesap, Wealthy.

Fair apples to plant: Alexander, Champion, Detroit Red, Ingram, Longfield, Newtown Pippin, Pewaukee, Porter, Shackelford, Yellow Bellflower.

Poor apples to plant: Akin, Arkansas Black, Benoni, Beach, Boiken, Coffelt, Chicago, Red Canada, Charlamoff, Early Melon, Early Harvard, Fallawater, Newtown Spitzenburg, Long Stem, Lawver, Lord Suffield, Mammoth Blacktwig, Monmouth Pippin, Mann, Oliver, Ohio Nonpareil, Primate, Rambo, Red Bietigheimer, Red June, Golden Russet, English Golden Russet, Sweet June, Early Strawberry, Early Ripe, Seek-No-Further, Senator, Scott's Winter, Smith's Cider, Tallman, Wolf River, Walbridge, Wisner's Dessert, Winter Banana.

My opinion of the varieties as tested is based not upon single tres but upon plantings of 20 or more trees of the varieties mentioned.

Best apples for Summer: Yellow Transparent, Tetofski, Gravenstein, Williams. Best apples for Fall: Twenty Ounce, Grimes, Wagener. Best apples for late Fall and early Winter: Jonathan, Hubbardston, McIntosh. Best apples for Winter: Baldwin, Ben Davis, Esopus Spitzenburg, Rhode Island Greening, King, Rome Beauty, Sutton, Stayman, York Imperial. Best apples for fillers: Yellow Transparent, Tetofski, Twenty Ounce, Wagener, Jonathan.

PRIZES AT STATE FAIR.—In addition to the first prize for general collection of apples, the following list of prizes obtained in 1912 and 1913 at the State Fair shows to some extent the adaptability of varieties mentioned for this section: First premiums 1912: Hubbardston, Longfield, Mammoth Blacktwig, Wagener, Scott's Winter, Stayman. Second premium 1912: Baldwin. Third premium on Baldwins this year was also taken by my neighbor Mr. Moses B. Griffing. Ben Davis, Bismarck, Delicious, Grimes, McIntosh, Pewaukee. Third premiums 1912: Fameuse, Gano, Northwestern, Greening, Primate, Twenty Ounce. First premiums 1913: Benoni, Bismarck, Esopus Spitzenburg, Fall Pippin, Fanny, Hubbardston, McIntosh, Porter, Rome Beauty, Stayman, Yellow Bellflower, York Imperial. Second premiums 1913: Delicious, Fameuse, Northwestern, Greening. Third premiums, 1913: Baldwin, Grimes, Williams Favorite.

YIELD AND PROFITS.—Previous to 1910 the yield of the orchard was very small: 1910, 800 bushels; 1911, 1,700 bushels; 1912, 1,100 bushels; 1913, 2,200; divided about as follows: one-sixth Stayman, one-sixth Jonathan, one-quarter Ben Davis, one-quarter Missouri Pippin, one-sixth other varieties, which gives a good idea of comparative yields. For this section the orchard is too young to make a profit as yet. Expenditures have much exceeded receipts each year; the fillers have not yet come to the front and paid for themselves and their care, and I question whether they will ever do so. I have boxed most of my apples, all that were suitable each year, and have received more than they would have sold for in barrels, but when the greater expense of handling and packing is considered, the barrel is probably as good a package for shipment as the box.

How To Make Your Garden Thrive and Mature Early

The kind of plant-food required in your soil depends on the kind of a crop you are to raise. In order to make your garden produce its maximum yield at the lowest cost for fertilizer you should supply only those elements which are immediately available and which will be absorbed by the plant.

Consumers Brands

For Gardeners, Fruit-Growers, Florists and General Use

Comprise special distinct compositions of plant-food elements for vegetables, small fruits, root-crops, flowers, greenhouses, lawns and tree-crops. They supply only the constituents your particular soil needs for some special crop. For example our

Early-Crop Odorless Fertilizer

supplies your soil with the four plant-food elements in immediately available form needed by vegetables and small fruits for quick growth and early maturity. It is the most effective and convenient fertilizer you can apply for such crops and in the end the most economical.

Write today for our *free* Fertilizer Booklet—it is full of valuable information and is as valuable as a text-book on soil fertility.

Special Parcel Post Offer

Our Mak Gro Odorless Plant Food is a clean high grade granular fertilizer for indoor and outdoor use on potted plants, flower-beds, small fruits, lawns and small gardens. It is *made especially for the amateur* and is pleasant to apply. We will mail a five-pound bag to any address for $1.00. Write today for special circular.

Havana Metal Wheel Co.
Box 17, Havana, ILL.

Our 10,000-Mile Tests

Reo the Fifth

Is built on a chassis which we have kept running for three years in test cars.

The test cars are kept running at high speed on rough roads. They are run night and day up to 10,000 miles. Then we take them apart and inspect them.

We require that vital parts, after 10,000 miles, shall remain about as good as new.

To insure this, all our steel is made to formula and each lot is analyzed twice. Our gears are tested in a 50-ton crushing machine. Our springs are tested for 100,000 vibrations.

Each driving part must stand a test for at least 50 per cent over-capacity. After radical tests we take apart each engine and inspect it.

We use 15 roller bearings—190 drop forgings. We use a very costly clutch to avoid clashing gears. And our gear shifting is done by moving a small rod three inches.

Takes Six Weeks

It takes six weeks to build this car as we build it. And it adds one-fourth to the necessary cost of each car.

But the result is a car to keep. Year after year it stays new. And you save trouble, save upkeep, save repairs. Mr. R. E. Olds builds every car as though he built it for himself.

Now $220 Less

This year's Reo the Fifth sells for $220 less than last year's model, equipped with electric starter. This saving results from confining our output for years to this single chassis. Now all the special machinery has been charged against previous output.

Yet this season's model with the new streamline body, is the handsomest that ever went from our factory. And the best equipped.

You men who buy a car to keep want a car like this. It marks the best that Mr. Olds can do after 27 years of car building. The demand for this car, almost every month, far exceeds our output.

Sold by a thousand dealers. Ask for our catalog and address of nearest showroom.

Hope Farm Notes

SOME DISHWASHING.—All sorts of requests come from our people. Not long ago a woman asked for the statistics of dishwashing. Probably few people ever considered that this humble job could get up to the dignity of "statistics." The Government gathers and guesses at figures of all sorts. Every successful business must have the figures showing cost and income, or it will be wrecked. Yet who ever has thought it worth while to figure out the "statistics" of that most important of all "jobs"—kitchen work?

I think the way to get statistics is to go and get them. No use wandering off into the next county or going hat in hand to some expert. If you want dishwashing statistics go right into your own kitchen and get them. Nothing like taking your own advice, so I invaded the Hope Farm kitchen with tape measure, pencil and paper. On March 15 we had 15 people in the family. Three friends drove up to have dinner with us, but I did not count them, for when you mix statistics up with friendship you take the joy out of both jobs. The figures I am to give will show rather less than more of a day's dishwashing at Hope Farm. First I measured the dishes. Then I suddenly found that I had forgotten how to figure the area of a circle. It was necessary to go back 40 years to the children's school books in order to do it. It's easy enough when you hunt up the rule to find how many square inches you must wash and wipe over to clean up the day's dishes. Having obtained the figures, we found the number of dishes used during the day and proceeded to multiply. This is what we figure it out—counting both sides of each plate:

	Sq. Ins.
Cups	1.900
Saucers	1.281
Large Saucers	4.368
Large Plates	4.968
Small Plates	2.000
Platters	800
Glasses	5.740
Pitchers	650
Pots and Pans	2.120
Spoons	160
Total square inches	23.987

The large saucers are used by the children in eating cereal and milk. Do not be alarmed at the large area of "glasses." This is a temperance hotel, but the children drink milk freely and we are all fond of water. The total for the day will average more than this, as there are always extra pans and dishes which must be scoured or cleaned.

Now see what this means. Every square inch of this job must be washed and then wiped—gone over twice. Thus each day 166 square feet of surface must be cleaned and dried. When this is all done by hand it means going over 332 square feet with the hands. That represents 60,590 square feet in the course of a year, and there are 43,560 square feet in an acre. People say that no one has ever measured the possibilities of one acre of land. What about this acre and a half of dish surface? Let the women folks keep this up for 10 or 20 years, and they will come close to covering a good-sized farm. If we are to talk about farm economy for the outdoor jobs, what about this intense cultivation of dirty dishes? Would you go back to the scythe and quit the mowing machine, or go to pumping water by hand and get rid of the engine or windmill? I have something of an imagination, but I can hardly see you doing it. Yet how does the farm kitchen stand in this scheme of farm economy? Water for the barn stock is fine—but what about the kitchen stock? A good dishwashing machine ought to be a fixture, just as much as a mower or reaper. Personally I hope that some day cheap and neat paper plates will be invented, so that they can be burned up after the meal and leave the cook free to do something besides washing an acre of dish surface.

SOME WEATHER.—As nearly as I can find out, Hope Farm, or part of it, has been under the cultivation of white men something over 200 years. For some centuries before that the Indians grew grapes on our hills and exchanged them for furs and corn. In all that time, however, I doubt if the middle of March presented less of a Spring-like appearance than this year. The snowdrifts are still high on the hills, and the ground is frozen. The snow melts slowly—that's one good thing for our hills; but plowing is a long way off. Spraying has also been greatly delayed. It is hard to work through the drifts with the tank, and the ends of the day are too cold for spraying. This is the season when the spray business must jump when it does start, and a good power sprayer will half pay for itself in this sort of a season. In former seasons we have had spraying weather during each of the Winter months, but there has been little opportunity this year.

One thing at least we shall make sure of, and that is a good supply of fuel. We use dead chestnuts from the woods, hauled down in 10-foot lengths. We bought a saw and rigged it up by the woodshed. Then the gasoline engine on the power sprayer was belted up to the saw and put at work. I see no reason why this strong arm should sit idle on that sprayer for 10 months of the year, when it can be used for pumping and sawing.

Every year when we have a snowy Winter farmers console themselves by saying that the grass and grain crops are sure to be fine. This usually follows. Somehow farmers get the idea that the nitrogen which the snow brings down to the soil is responsible for the increase. I doubt if there is enough of it to count. It is true that some nitrogen is washed out of the air by the snow, but it is a very small amount after all. I think the snow helps the soil by filling it full of water, and helps the crops by protecting them, like the mulch on strawberries. When snow melts slowly the water settles deeply into the soil. It is far more likely to stay there than when it comes in a heavy rain which washes across the fields. The snow water remains in the soil, and thus the grass and grain have a better opportunity in early Spring. Then the snow covers the grain and new seeding, and prevents the heave and pull of the frost on the soil. Under the snow the plants may go on making root growth, as I am sure strawberries often do under the mulch. Then when the snow finally goes these protected plants are ready to begin growth at once. For this reason I expect this coming year to be a banner season for our cover crops—rye, vetch and Crimson clover. I think it is to be one of the years when Crimson clover does its best with us. As we have over 30 acres of these cover crops we are interested in the snow. I think this matter of Spring protection for our grain crops is to be an important one. We have tried sowing barley with the rye and cover crops. It makes a fair growth during the Fall, and then dies in a mat over the ground. Our experience is that this dead mat protects the young rye through the early Spring as a mulch.

Our old stone house is being used as a hospital just now. The boy is home from college with a case of "mumps," and he is quarantined in the room where we may say that George Washington may possibly have slept. At any rate, the house was here when Washington and his discouraged army wintered some four miles away. If he did not sleep in this old house he missed an opportunity. At any rate the boy's head is not swelled at any thought of his great ghostly companion. There is swelling enough with the mumps without adding to it. I suppose if we were to know how many cases there have been in that old house since its stones were laid the present affliction would seem a light one. No doubt before this house was built, Indians in their wigwams have greeted their little world with a swelled neck and a changed voice without knowing just what ailed them. These, however, are very poor companions of misery. We can only hope the younger children will skip the mumps. H. W. C.

ONE of the Atlantic City's life guards was discussing his profession. "Funny things happen to us guards sometimes," said he. "A society belle from Spruce street went into the water wearing one of those fashionable transformations, or wigs. A big wave went over her and when she came up the transformation was floating out to sea. She turned and ran to Tim. "'Oh, save my hair!' she yelled. 'Save my hair!' "'Pardon me, lady,' says Tim. 'I'm a life saver, not a hair restorer.'"—Philadelphia Ledger.

Get Wise to the Building Game

Send for the Lewis Easy-Built Book of Home Plans. It shows you every kink of the building game. It tells you how to free yourself from exorbitant lumber prices and high labor costs. This book will show you how to make every dollar do double duty. Send for it, a two cent stamp will save you many dollars.

$248.00 and Up Lewis Easy-Built Homes come in many sizes, styles and prices. Small inexpensive cottages, cozy, attractive bungalows and larger homes, each one a masterpiece of design and construction. Lewis Homes are carefully planned and laid out by skilled designers—men with a lifetime knowledge of the business.

Send for Book Write today for our attractive book of Easy-Built Homes. It's free to all homebuilders. Rush a letter to us Get this money-saving book today. Get wise to the building game.

Shipped complete direct to you—Easy-Built Homes are made of the best grades of lumber. We furnish all lumber for framework, siding, sheathing, roofing, floor lining, exterior and interior finish and mill work (with windows glazed), all sawed and worked to fit; hardware, paints and varnish, building paper and plaster. Complete working plans come with each home.

P-H-O-S-P-H-O-R-U-S

THE MASTER KEY TO PERMANENT AGRICULTURE

Phosphorus is so-called because it's use gives largely increased yields of clover, alfalfa and other legumes, which secure nitrogen from the air. The acids formed by the decaying roots of these plants make available the potash which is abundant in most soils. Recorded experiments on all normal soils in the Eastern and Middle Western states show greater profits from the use of phosphorus than from any other element, or combination of elements.

DAYBREAK ROCK PHOSPHATE

13% Phosphorus, Ground 95% Through 10,000 Mesh Screen

Rock Phosphate has been thoroughly investigated by the agricultural authorities and tested in the field by the leading Experiment Stations. It has proved to be the most profitable fertilizer on all soils deficient in Phosphorus, and the soil surveys show this deficiency in 90% of the cultivated land in the Eastern and Central states. A review of these experiments and much valuable general information about fertilizers is given in "The Farm That Won't Wear Out," by Dr. Cyril G. Hopkins. This book will be sent free to the first 100 farmers who write to us for delivered prices on *Rock Phosphate*, and state where you saw this ad.

"CORONA DRY"
Arsenate of Lead
Patented June 10th, 1913
Eliminates guesswork. Standardizes the strength of the spray mixture. Saves work in mixing—no straining needed.

Spray with a mixture that *always* has the same strength. You cannot use a paste arsenate and be sure of uniform strength. *Large and practical usage in all sections, for all purposes, has proved* that in "Corona Dry" you do get this very thing plus highest poisoning power, and absolute safety from "burning."

Largest and Most Progressive Growers Everywhere

say that "Corona Dry" has proved efficient—has always the same high efficiency—is more simple, cleaner and easier to handle than a paste material—is easily mixed and needs no straining—can be measured easily and correctly. "Corona Dry" positively kills and exterminates *Coddling Moth, Curculio and all leaf-eating insects* of both fruit and shade trees. One pound of "Corona Dry" will do the work of three pounds of paste and do it better. Write for booklet. Ask for Corona "Tree Insurance" Policy. Address

CORONA CHEMICAL CO.

CUSHMAN MOTOR WORKS, 2091 N St., Lincoln, Neb.

Keep Up Spraying.

There is no scale in this section, and never has been. Is there any need of using dormant spray on apple orchard? My neighbors all use dormant spray, but do not know what they use it for.

Dale, N. Y. G. C. M.

Are you perfectly sure there is no scale in your section? We have known cases when people were very positive about this, yet the scale suddenly appeared. This insect breeds with great rapidity, and a very few of them would soon plaster an orchard. We know a number of fruit growers who feel that they have certainly cleaned the scale out of their orchard, yet they continue dormant spraying. They call it an insurance against scale which is worth while, and they are also convinced that the lime-sulphur helps clean out several other insects, and is also very useful in combating leaf-curl, brown rot, and several other diseases of fruit trees. We think your neighbors are wise in keeping up their spraying.

Coloring Lime-sulphur Mixture.

What can I use to color the lime-sulphur so we can tell where we left off spraying? D. P.

In my opinion there is very little need of a marker to indicate where the spraying has stopped when lime-sulphur is used. If the material is put on with sufficient thoroughness, it will leave a very evident mark when applied in Winter at the usual Winter strengths for scale. It may require that one get closer to the trees in order to see the mark, but it is always there with abundant definiteness wherever the applications are made sufficiently heavy. In the Summer the marks of spray are even more evident because of the foliage, upon which the dried spray clings and stands out very prominently. For these reasons therefore I would not advise the use of any marker in connection with lime-sulphur. If the inquirer is insistent on securing more distinct evidence, however, he can readily do so by adding slaked lime at the rate of three to six pounds per 50 gallons. This addition will make a very satisfactory marker, but it increases the mechanical difficulties of spraying somewhat, and it also tends to break down the polysulfids in the lime-sulphur solution, which may reduce the effectiveness of the spray to some extent.

J. P. STEWART,
Experimental Pomologist.
Penn. State College.

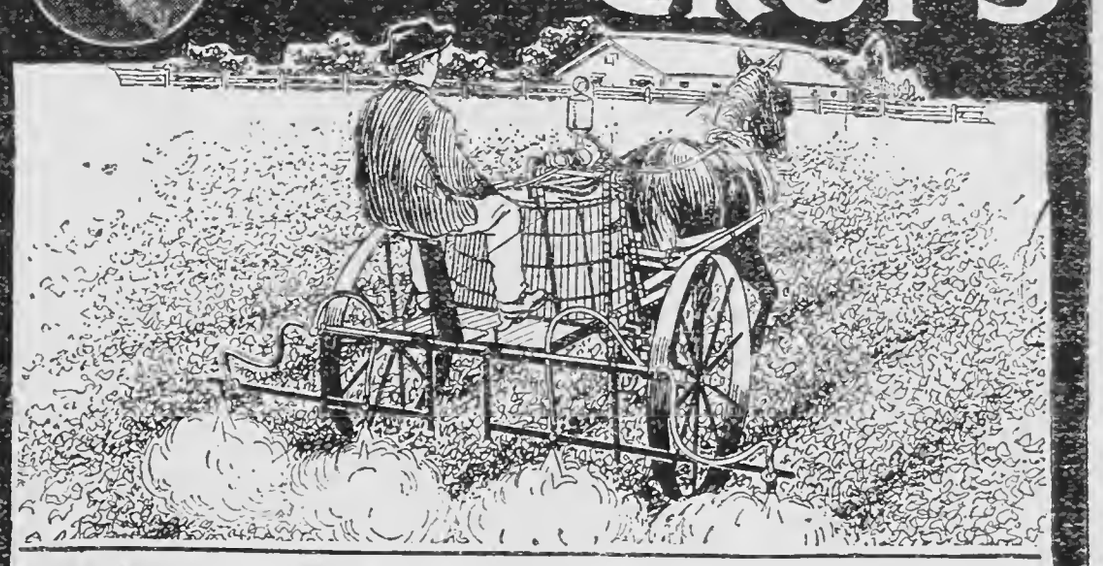
A few pounds of lime slaked and added to a barrel of the dilute lime-sulphur mixture used for dormant spraying, will make the trees much whiter so that one is able to distinguish the sprayed from the unsprayed trees. It will not be detrimental to the mixture. This question has oft n arisen among orchardists, and they speak of adding the lime as a marker. It does not render the lime-sulphur mixture any more effective in killing the scale, nor does it make it less so, but simply shows where it has been applied.

W. E. BRITTON,
Connecticut. State Entomologist.

If D. P. desires to have a marker in his lime-sulphur such can be secured by adding four to five pounds of caustic lime, which has been slaked and made into "milk of lime" to each 50 gallons of the spray mixture. This lime could be slaked up in any quantity as a stock solution, so as to have one pound of lime to each gallon of water; then in order to have four or five pounds of lime to each 50 gallons of the lime-sulphur it can be measured out in gallons. The stock solution of "milk of lime" should of course, be strained as it is put in the spray tank. We have used two pounds of lime to 50 gallons of lime-sulphur, but this does not mark the trees very distinctly, and I think four or five pounds would be better. M. A. BLAKE.
New Jersey. Horticulturist.

The addition of some material to the dilute lime-sulphur solution to mark trees during the progress of spraying operations is a subject which has been brought to our attention a number of times during the past few years. This was particularly true during the period which marked the change from the use of the old homemade, boiled lime-sulphur solution to the use of the concentrated preparations. With continued use of the concentrated solution growers in New York have come to recognize when the trees are thoroughly coated with the wash, and for this reason few orchardists take the trouble to add any marking material to the liquid. If, however, such material is desired it is possible to add a solution of air-slaked lime, or perhaps a milk of lime made from stone lime. If a marker is desired at least five pounds of either of these materials is necessary in order to whiten the trees. As a rule, however, I believe that if a tree is thoroughly drenched with the mixture it is unnecessary to add any marker to the solution.

H. E. HODGKISS.
Geneva, N. Y. Asst. Entomologist.

I WILL GUARANTEE TO INCREASE YOUR CROPS


I can guarantee this very easily if you will follow the advice given in my new free book, "Why, How and When to Spray." This is not just a catalog, but a book of genuine information how to make field, garden and orchard produce bigger and better crops. Contains 74 illustrations of insects and fungus pests and gives the remedy that has proven successful in preventing their deadly work. A number of Experiment Station reports are given, showing the results accomplished in dollars and cents. The book also shows the complete line of famous "HURST SPRAYERS" for field and orchard—28 different styles and sizes. It explains in detail our liberal plan of
10 DAYS' FREE TRIAL---5-YEAR GUARANTEE
NO MONEY IN ADVANCE—NO FREIGHT TO PAY
Our liberal selling policy makes it easy for you to buy a sprayer without taking any risk whatever, and you can have your own time to pay. HURST SPRAYERS are made by practical men who know the needs of the farmer and fruit grower and what a sprayer should do. Our 27 years of experience in manufacturing, together with the large capacity of our factory, enables us to build the very best sprayers at the LOWEST POSSIBLE PRICES. Write to-day for my
BOOK "WHY, HOW AND WHEN TO SPRAY" FREE
and get the full details of my liberal offer. You will need this book whether you buy a HURST SPRAYER or not, and I will be only too glad to send it to you, postage paid. I will also tell you about my special
MONEY SAVING OFFER
This offer goes to the first buyer in each locality this season. Now write at once and be the first—tell me what size sprayer you need or what you have to spray and I will send the book and our special offer at once—a postal card will do.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

"The best farm papers are the ones that are willing to 'wise up' the farmers!"

That comes from a man who makes farming pay because he has studied it out in detail. What he means by "wise up" is to make people think. The world may be roughly divided into parrots and thinkers, with many shades of difference. The parrot is content to have things explained or analyzed for him. He takes the word of another, adapts it to his own meaning, without thought, and goes on. The thinker accepts no man's word until he has tested it by reason and common sense. To "wise up" a man is not to do his thinking for him, but to lead him on to think for himself. The noblest service you can render any man is to lead him to think sanely for himself.

*

I AM planning to take the U. S. Civil Service examination for field forecast agent. Part of the paper is "Questions on Crop-reporting Methods." Any information you can give me on the subject will be greatly appreciated. Did you not have an article on this subject in 1913? E. F. W.

Somehow we do not feel quite as civil toward this civil service examination business as we are told we ought to. We have received a number of letters from people who are evidently "cramming" for an examination. Most of them do not seem to be practically fitted for the work, but by reading a few books or articles they hope to get by on a written examination. At a real test of the human nature and common sense required to fill such a position many of these candidates would surely fail, though their paper qualifications might carry them through. There are many positions in scientific agriculture where plain sense or instinct is worth five times as much as study or book knowledge. The weakness of this civil service seems to be a failure to consider these essential things.

*

As stated, the work of the institute so far has wholly been along the line of instructing us how to increase the production. Most of us knew these things and some more, but what we never knew and no one of our teachers ventured to inform us, how to coöperate and change the conditions so we could receive a fair remuneration for our labor. There is where the rub is. We receive, as a whole, less for our products than any other section of this, or any other, country, while we pay higher wages, higher taxes and higher rate of interest on money than they do anywhere else, and also pay the very highest price for implements and machinery.

We add that to our weekly collection of studies of the 35-cent dollar. This time it comes from Montana. While the above statement will not be used by the railroads as an immigration document, we have not seen it controverted. It voices the discontent which has been growing regarding the one-sided education which many of these farmers feel they have been receiving. It may be and is argued that it is not the function of the colleges or stations or institutes to teach coöperation or business methods. The need of such education is recognized by the farmers themselves, and if the agencies we have mentioned cannot or will not give it they cannot blame the farmers if they go elsewhere for it, and have a kindly feeling for those who provide it for them. A large share of the work that must be done is not education at all, but the development of confidence in human nature, so that farmers may trust one another and learn to work together.

"It does me good to sit on the 'bleachers' and see you knock the frauds." I. C.

Massachusetts.

We have been accused of "playing to the galleries" before now. When we see who sits up there we realize that good acting is required. Those who sit on the "bleachers" take a hand in the game. They are far more human and nearer right than those who cover the soft reserved seats. We try to play a straight, fair game for all, with protection but no favors. And here is the philosophy laid down to us by a great agricultural paper:

"We do not take any stock in the so-called plain or common farmer. He is the most ungrateful citizen in the country, and will go back on you when you need him."

We have not found him so, but rather the most loyal friend that one can have. THE R. N.-Y. has been made what it is by this same "plain, common farmer." We have found him staunch and true. He has never failed as yet, and he never will.

*

"ENOUGH food wasted on my farm this season to feed three average families for a year," said a prominent Hudson River farmer.

"My team and truck frequently stand in line at the dock for a chance to load produce from four o'clock in the afternoon to 10 o'clock the next morning; some one has to pay the expense," said a large wholesale produce dealer in New York.

"The cost of fresh farm food products is so high I am forced to buy cheaper substitutes," said a prominent city housewife.

All three of these statements were recently made to the writer. Is it possible that we shall forever shut our eyes and permit this state of affairs to continue indefinitely? Food rotting on the farms within 65 miles of New York because the producer cannot get enough out of it to pay the cost of packing and shipping. Families in the city growing anæmic on cheap and adulterated food substitutes because these same farm products are too expensive for consumption. Dealers admitting the most extravagant form of distribution that could be advised; and speculating in food products, and controlling distribution in ways which they refuse to admit.

These are the conditions that exist. They are the conditions that the coöperative committees of the New York State Agricultural Society have been studying and working to eliminate. They are the conditions that Governor Glynn referred to in his vigorous message to the Legislature in support of the Food and Market bill which he proposed. But there is intimation that some one is afraid that some one else will get credit for it, and that consequently the bill cannot pass. This is a pretty situation, indeed. We can hardly believe that grown men will take such a position. But we shall see who are the friends of the farm, and who are its enemies; and if the farmers of New York State do not punish the latter and reward the former, we mistake their temper at this time. Must food rot and children starve within 65 miles of each other on a navigable river that a few middlemen may grow rich on the traffic in food?

*

THE United States Express Company, after 60 years of prosperity, has given up the fight for business and will be liquidated. The competition from parcel post and the lower rates forced by the Interstate Commerce Commission, have made it impossible for the express company to continue business at a profit. At least 10 years ago THE R. N.-Y. stated that the express companies had it in their power to stave off parcel post and keep their monopoly for 25 years longer. The way to do this was to make fair concessions and satisfy the public, give cheaper and better service, as they could easily do. The express companies hooted at such advice. They had the public by the throat, and Congress by the pocket. What more did they want? In their strength and power these express companies never dreamed that the people would kick themselves free and transfer the relation between hand and throat to the other side. These companies misjudged the power of public opinion and told the people to go to a place which they are now steering for. As it has turned out, they could not have done a more patriotic thing for their country, for they have taught the common people how to organize and use their power. Parcel post is more than a just public convenience. It is the beginning of an evolution in public service. As the express companies slide off into the waters of liquidation they may realize that their own selfish arrogance is responsible for their fate. *"Who is there to mourn for Logan?"*

EVERY year at this time we have many questions about planting the so-called "superior quality" apples. As a rule such varieties are not the heaviest bearers, and they require great care. In choice markets they sell at high prices. Will it pay to plant them in preference to the standard, hardy sorts which are known as wholesale fruit? In theory it might pay, but we have gone to practical men for the answer, and this one is typical:

Those who want to make money for sure and do it easiest, better in New York and New England stick to Baldwin, R. I. Greening and Spy; New Jersey and south to Virginia, Winesap; Ohio Valley, Rome Beauty. These are *sure* and safe. J. H. HALE.

Connecticut.

In our own orchard Baldwin and McIntosh Red are most profitable. There may be finer apples, but where the old sorts are well grown they will prove most profitable for the majority of growers.

*

THE boll weevil has caused a loss to the cotton crop of $500,000,000 during the past 20 years. Yet it has probably done the Gulf States more good than any man or group of men since the Civil War. *A nasty, crawling insect a greater benefactor than a man?* Yes, because the insect has compelled the South to break away from a one-crop system of growing cotton. Before the weevil came the South was buying hay, meat, butter, bread, beans and other food from the North, and at the same time exhausting her soil by sending away a crop high in fertilizing material. Wise men grew white-haired and died preaching a diversified farming, but their words were but little heeded. Then came the weevil, not preaching or arguing, but gnawing the heart out of the cotton business and bringing men face to face with ruin. That was a compelling force which drove farmers to corn and meat production. They would not have gone otherwise. As it is, the future will see the Gulf States one of the greatest meat-producing sections of the country. Man gave the theory; the weevil came along with the practical application and rubbed it in. Calamity is the companion which leads most of us to opportunity.

*

WE know a man who spends much of his time discussing what he calls "large questions." He does it somewhat to the detriment of his own farming. He can tell you all about the Mexican question and half a dozen others, and can also tell you just what the Administration ought to do. You would think he ought to go to Congress at least, but he talks just a little too much, and has cut out so large a job that his farm shows the effect of it. Now this man goes home and is hurt because his wife is not interested in these "large questions." Her mind deals with smaller things. She keeps an eye on the school teacher and encourages him; she has interested the people in a school garden and a children's corn contest and is helping to make a model country school. Her work is felt in the Grange, in the church, in all local activities, quietly but always for the little things which mean progress. She has tried to get her husband interested in these small things too, but he has no time for these trifles when Villa might become president of Mexico or Murphy be thrown out of Tammany Hall or a new tariff bill passed. This man could not influence one of these "large" things to save his life, while he might influence the little events right around him, and by so doing indirectly influence the larger ones. You cannot make him see it. He has hitched his wagon—not to a star, but to the reflection of one in the water. Let him work to make his own school district the best and happiest place to live in, and he would gain the power to influence these "large" matters. He cannot do it in any other way. So the man goes reaching after public rainbows, while the woman quietly directs the little things at her hand. Which do you call the better citizen?

BREVITIES.

YOU can hardly have too much "bread on the waters." It will not dissolve, but grow.

WE begin early to say that arsenate of lead paste as well as tar will make the crows say "sour grapes" to the seed corn.

As for patching up a poor lawn by raking it over and sowing seed on top, the chances are against success with the plan. It should be worked up and fitted all over.

TAKE it from us—there will be no let up in the campaign for a more comfortable kitchen. The women have equal rights with the cows for running water in the house.

COÖPERATION under government control has struck Northern Africa. In Tripoli, Italian capital is to be used in forming Arabs into agricultural groups directed by skilled Italian farmers.

So far as we know, lime is the only substance thus far used to color the lime-sulphur mixture as a marker. Some of the fruit growers believe that this extra lime weakens the fungicidal effect of the mixture.

WOMAN AND HOME

A Co-operative Farm Laundry

Which Minnesota Women Enjoy

By Miss Jennie Buell, Lecturer Michigan State Grange

The successful demonstration of a co-operative laundry at Chatfield, Minnesota, during the past year has arrested thought concerning the greatest remaining stronghold of household efficiency and waste. Such a stronghold is the weekly wash. Home improvements have dispensed with some burdensome tasks, and relegated others to the barn or factory, but washing and ironing still resist attack. Machines have alleviated but not wholly relieved the situation. For the most part the steam, the slop, the heavy tubs or machines, the exposure at the line—in short, Blue Monday and most of its accompaniments, remain.

The story of the Chatfield laundry should be familiar to every woman head of a household. It is simply home economics applied on a neighborhood scale. Acquaintance with the principles upon which it is founded and operated tends to pave the way for a similar laundry in every community. In some cases it will be slower to come than in others, because we are not all yet prepared to work together. Ah, and there's the rub! The Minnesota laundry grew very naturally and logically out of a coöperative creamery which was started and has been run upon true coöperative principles. These principles in brief are: 1. Votes based on men or patronage, not on capital stock; 2. Only reasonable interest paid on capital stock; 3. Net earnings divided on a patronage basis.

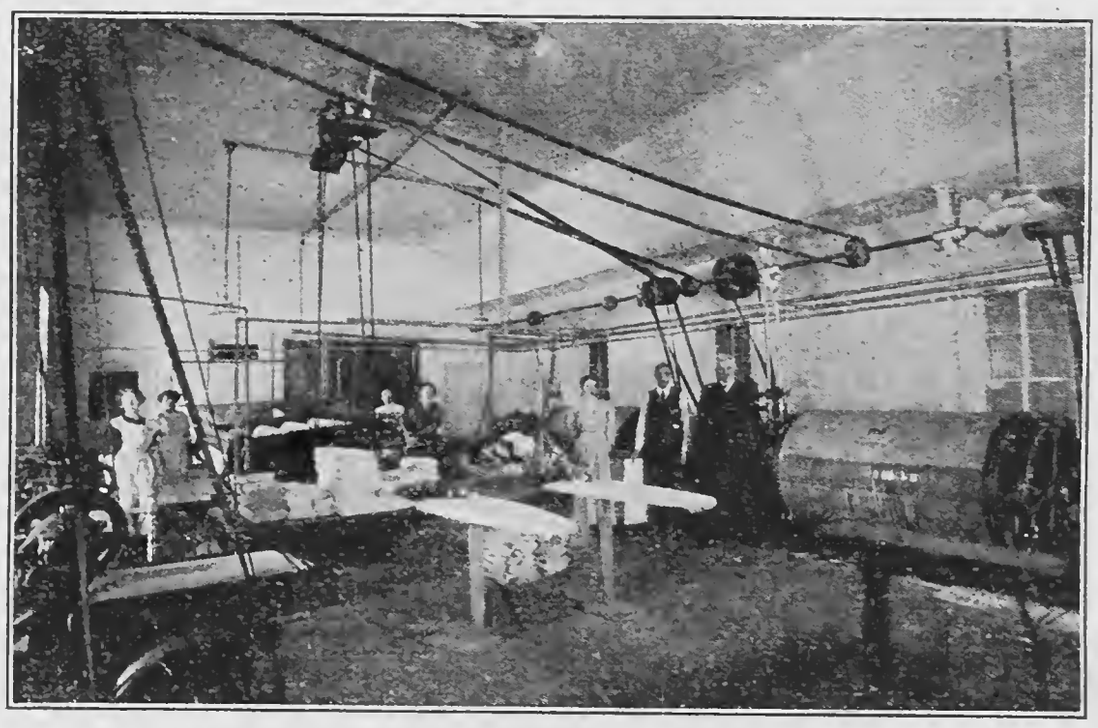
When these crystal principles are once understood by our women, the idea of really working together will have gained a tremendous leverage. The creamery at Chatfield opened in 1889, and has operated under these provisions. About seven years ago the man who was then butter maker rigged up an old churn with belting and shafting so that it could be run as a washing machine in the engine room. This suggested the economy of using the power plant for other purposes than that alone of butter making. There were the engine, water supply, sewer system and facilities for heating water—all installed but used only during afternoons. The practicability of the idea appealed to the management, but extensive repairs had just been made, and the matter halted until a year ago last Summer. The annual dividends, however, were voted to remain in the treasury and, in 1912, these amounted to $2,000. At this time the question of the feasibility of a coöperative laundry was brought up in the local farmers' club. In the popular discussion which ensued, the project gained headway, and a little later, at a Summer picnic, was put to popular vote. No one was debarred from this vote by reason of sex, and the result was overwhelmingly in favor of a laundry. Canvass for members of the proposed new association was made among both farm and townspeople. Shares sold for $5, and stockholders invested from one to five shares each. It must be remembered that each stockholder has but one vote, not matter how many shares he owns, making it an entirely democratic organization. There are now 224 shareholders, and every care has been taken to perfect the simplest organization consistent with highest efficiency. The officers of the creamery are also officers of the laundry association, but the business of each is kept entirely separate from that of the other. Thoroughly up to date and well protected laundry machinery, with capacity of $400 worth of work weekly, was installed in an unpretentious, sanitary and convenient addition to the creamery building. A competent manager is employed at a salary equal to that of a first-class butter maker, with an assistant at 20 cents per hour and five helpers at 15 cents per hour. Most of the washings come in on the cream wagons, but those from town are collected at an additional expense of about 10 per cent. The charges are five cents per pound for family washings, and this includes the ironing of all the flat work, underwear and hosiery. All other work, which cannot be ironed in the mangle, is starched, dried, folded and sent home in this shape unless ordered ironed by hand, in which latter case it is charged for at actual cost. About half the patrons order their clothes ironed. The first year's annual report showed that the laundry had done over 5,000 family washings at an average of 95 cents each.

The above is the business side of the story. The real success or failure of the laundry lies in the answer to the question, "What do the women think of it?"

CO-OPERATIVE LAUNDRY AT CHATFIELD, MINN.

If anyone really cares to know, she should send for the Minnesota Farmers' Institute Annual for 1913, which is a co-operation number, and read therein personal testimonials from 25 women who patronize this laundry. Address Superintendent A. D. Wilson, University Farm, St. Paul, Minn., with 11 cents for postage. In this report of the laundry appear such expressions regarding it as these made by the women themselves: "The work is excellent, much better than could be done at home"; "Find the fine articles as nice as the plain"; "Find plenty of things to do about the house to more than make up the cost"; "Best 'lift' I have received, and comes quite near to solving the hired help problem on the farm"; "Besides doing away with two days hard work each week, the washing and ironing are done better and cheaper than they could be done at home"; "I always know the clothes are sterilized when coming from the laundry"; "My husband says he will add another cow to the herd and that will pay the extra expense of the laundry by way of the coöperative creamery"; "No one could believe it without seeing it"; "I could go on for pages telling the joys gotten out of the time which used to be spent on labor that no person ever did for what pleasure they got out of it."

No help for the farm home can be too widely heralded until every woman in the land is relieved of *unnecessary* manual work, and is at liberty to devote more time to her family in other ways.



INTERIOR VIEW OF LAUNDRY.

Keeping Children on the Farm.

[The following paper was read by Mr. G. L. Ball at his local Grange in Cattaraugus Co., N. Y. A good share of the discussion of this topic is conducted by people who never had a farm and never raised any children. Here we have the real thing by a farmer.]

Our worthy lecturer has set me a hard task, to wit, to write about how to keep the boys on the farm. Hard, because I am not enthusiastic about it, and don't believe it is the thing to do in the sense that it is usually urged by writers on agricultural subjects.

First, the phrase, "Keep them on the farm," means a sort of restraint, or at least an urging to remain whether they like it or not. I do not agree with that idea at all, but would leave it to each individual to choose for himself. At the risk of being thought egotistical I will give a little of my own personal experience in agriculture. I began to be interested when quite young. As near as I can figure out, I was about three years old when the soil first began to tempt me to dig. My mother had a small pancake turner that seemed to me to be an ideal spade, and I was wont to borrow it for the purpose of digging in the garden. After digging a short time, I was quite apt to stop suddenly and go into the house saying I did not want to dig any more. Mother would say, "Why not? Did you see an angleworm?" I never acknowledged that to be the reason but would only say, "I do not want to dig any more," but the worm was the reason just the same. In other words I had run across what, to me, was disagreeable and consequently was ready to quit. Now I reason that is what happens to a great many of the farmer boys. They come to things that are disagreeable, and do not want to dig any more, even though they have an ideal spade and the most tempting dirt. If they have the real farmer spirit they will soon get over that and return with renewed courage to their digging, and worms will be to them as they were later on to me, fish bait. It matters but little what is to be done if it is done with an end to be gained, and with a hearty good will it is a pleasure and not a task.

Boys as well as the rest of huamnity are much influenced by what is going on around them, and by the point of view of their associates and friends, and you people who think the boys should be kept on the farm should be always alive to the fact that what you do and what your neighbors do is what your boys and other people's boys will judge by as to the desirability of being on the farm. Let us look at the subject from the viewpoint of the boy himself, as near as we can; or as we might if we were boys again.

The constitution of the United States guarantees to all citizens the right to life, liberty and the pursuit of happiness. When the boy sees the business man of the city or town riding in an auto and going on pleasure or business trips by rail, and having the chance of the theatre, lectures, etc., he is apt to think the city is just the place for him to begin the pursuit, not knowing, or rather not stopping to think, of the vast majority of city people who do not have the opportunities which seem to him to be a part of city life.

Another phase of the subject is best illustrated by a glance at our own neighborhood. Take 10 farms along our north road. What do we see? Why, simply this: that judging by what our farmers do, the proper thing is to work the farm with the sole object in view of being able to leave it and live in town as soon as possible. I will give a list of 10 farms: First, a farm rented and owner living in town; second, farm worked and lived on by owners; third, farm rented and owner moved to town; fourth, farm rented and owner living in town; fifth, rented and owner living in town; sixth, farm rented, owner living in town; seventh, farm rented and owner living in town; eighth, farm rented, owner living on the place; ninth, farm worked and lived on by owner; tenth, worked and lived on by owner. To recapitulate, six out of 10 of the owners of the best farms in this part of the county "gone to town." What other conclusion can a boy draw than that it is just about the best thing ever to go to town and kick your heels against a dry goods box?

Why not live on a farm as if you really liked it? Why not treat the farm as if it were the best place on earth for a home, and the freest and finest place for the development of a real live human being that has ever been found?

Why not enjoy the earth and the fullness thereof, forgetting the angleworms, and bless your lucky stars that you are not obliged to work in a stuffy office, or toil as a part of a machine in some health-destroying factory? Ten to one if you do so live, your boy or your neighbor's boy who comes in contact with you will not need to be kept on the farm, but will stay there for the same reason that you do.

R. N.-Y.—We think Mr. Ball gets right down to the vital point in this paper. In every large family there are both boys and girls who are not naturally fitted for farming. They ought to find some other job, but always remember the farm as their home. Most boys leave the farm because father's dollar and mother's ambition go first. They follow.

Woman and the Home

CUDDLE DOON.

The bairnies cuddle doon at nicht,
Wi mickle faucht an' din;
"Oh, try and sleep, ye waukrife rogues,
Your faither's comin' in."
They never heed a word I speak;
I try to give a froon,
But aye, I hap them up and cry,
"Oh, bairnies, cuddle doon."

Wee Jamie wi' the curly head—
He aye sleeps next the wa',
Bangs up an' cries, "I want a piece"—
The rascal starts them a'.
I rin and fetch them pieces, drinks,
They stop awee the soun',
Then draw the blankets up an' cry,
"Noo, weanies, cuddle doon."

But ere five minutes gang wee Rab
Cries out frae 'neath the claes,
"Mither, mak' Tam gie ower at once,
He's kittlin wi' his taes."
The mischief's in that Tam for tricks,
He'd bother half the toon,
And aye, I hap them up an' cry,
"Oh, bairnies, cuddle doon."

At length they hear their faither's fit,
An' as he steeks the door,
They turn their faces to the wa',
While Tam pretends to snore,
"Hae a' the weans been gude," he asks
As he pits off his shoon;
"The bairnies, John, are in their bed
And long since cuddled doon."

An' jnst before we bed oursel's,
We look at our wee lambs:
Tam has his airm round wee Rab's neck
An' Rab his airm ronn' Tam's
I lift wee Jamie up the bed,
An' as I straik each croon,
I whisper, till my heart fills up
"Oh, bairnies cuddle doon."

The bairnies cuddle down at nicht,
Wi mirth that's dear to me;
But sune the big worl's cark and care
Will quaten doon their glee.
Yet come what will to ilka ane,
May he who sits aboon
Aye whisper, though their pows be bauld,
"Oh, bairnies cuddle doon."

—Alex Anderson.

The Common Question.

With each forthcoming issue of the "Woman and Home Magazine" we expect to give practical questions in household matters. We want to obtain brief replies to these questions so that we may print the answers in the following magazine issue. In this way it will be possible to develop a vast amount of practical experience. The question for this month follows. This problem of carrying ham and bacon through the Summer has troubled many a busy housewife; even those who have an excellent smoke-house often find trouble in carrying the meat through the hot weather. The following method is practiced in sections of Ohio. We would like to have our housekeepers tell us if they have found a better way. The answers to this question will be printed next month, at which time we shall present a new problem.

We are looking for information. The method (used by most of the neighbors) of storing ham and bacon for Summer use seems to be to slice it just as they do for use, then cook it about half what they would for the table, lay it in a common crock, and pour on grease enough to cover it. Then slice and fry another spiderful and so on. This saves the ham, but it does not make very rich eating next Summer. I would like to get some method that will enable us to lay the whole ham away until wanted, then have it fresh and juicy as it is in March. W. H. P.

*

If we could see ourselves as others see us, there would be a quick change in many habits or ways of doing things. If the world were all lined with mirrors, most of what we call nature or natural actions in human beings would be quickly crowded out. Take for example the case of the woman shown in the picture. Take a guess at what she is doing. To save time, we will give you the answer. She is calling the men folks to dinner. The boss and the hired man are in a distant field. The neighbor has walked across, and they are talking politics. Dinner is ready and the women folks are going visiting as soon as they get through the meal, so this lady is dressed up for her afternoon outing. Dinner is ready and getting cold, and yet Bill has forgotten to look at the sun, and politics has charmed away his hunger; so she is out by the woodpile with the wind blowing down her throat, trying to make Bill hear. If some one were to hold a mirror right up into her face as she stands there, there would be a horn or a bell or a whistle on that farm within 24 hours.

Mr H. Markley, of New Jersey, took this picture and then took the other which is shown herewith. This whistle takes the place of screeching and calling.

WHAT IS THIS WOMAN DOING?

The whistle is a good signal, but we would prefer a little chime of Swiss bells, which could be bought for a comparatively low price. They are more musical than the loud harsh farm bell, carry far, and are easily managed when set up by the kitchen door.

Here is the way Mr. Markley puts it:

"There is no bawling one's head off on this farm. A 10-cent whistle saves dollars in time—saves the wife from headache from bawling till she in hoarse. When the wind is not dead wrong, its loud, mellow note can be heard for half a mile. It is handy always on a little hook by the kitchen door. A sharp blow,

"WHISTLE AND I'LL COME."

and the deed is done. No time lost, no strain, no fretting, no unpleasantness. If mother is busy at the moment, one of the children blows the whistle, as you see in the picture. In this family where it is used, one long blast means 'eats,' step double-quick; two blasts means someone has called to see you; three blasts calls the children at any time mother wants them."

*

"I guess it's a fact that a pair of trousers does not necessarily establish a prima facie case of strength of character!"

That is the honest comment of a man who was told some of the things which a widow on a little farm did to hold her family together. Under the conditions which this woman faced eight men out of 10 would have wilted and given up the struggle. This woman became head, tail and middle of the family, and took up her hard task with no murmur of complaint. "Strength of character?" There is nothing in all the world equal to the courage which a frail and naturally timid woman will show in a struggle for her children. If any man should make gratitude his religion it is the son of such a woman.

*

THERE was once a hired man—a big, strong fellow capable of doing first-class work. The farmer who employed him was a good provider—said he believed in eating food which "sticks to the ribs." So there was meat three times a day; sausage, ham bacon and beef, "all you want and more." The hired man ate with the rest of the family. While the others ate heartily and kept strong and efficient at their outdoor work, the hired man was a poor eater, and did not seem to have the "snap" and energy which his big body should have held. "What's the matter with you?" said the farmer. "Can't you eat? If a man will not eat he cannot do farm work. What's wrong?"

"Well," said the hired man, "I have never eaten so much meat before. Try me on rice or something like that."

They did, and it worked wonders. On simpler food which suited him the man held his strength and regained his energy. On experiment it was found that there were three groups of people at that one table, each doing their best work on certain definite kinds of food. Even in this well-regulated family a single standard of diet did not suit all. Many a farmer will say this is a fairy tale and that there never was such a hired man—yet we have seen just such a character. The chief lesson is for those farmers who think their cows will all do their best on a single standard ration. The fact is that in every dairy herd there are dainty cows which prefer certain feeds, and will pay a large premium when their tastes are consulted.

THE cover page of the February 28 issue reminded me so much of my dear old mother. It is almost a perfect likeness, and she was such a great lover of flowers. E. T. FLANAGAN.
Illinois.

We have had several letters stating that this picture reminded the writers of some dear old friend. Some weeks ago we printed the picture of an elderly man helping his wife at household work. This paper was hardly distributed before a young woman wrote saying that this was an excellent likeness of her dead father. They had no picture of him which was nearly as good as this random photograph. We were able to help her obtain a better one. Our effort is to avoid what may be called "fancy pictures" and print the homely and true scenes which are true to life. It has long been the policy of THE R. N.-Y. to reflect, as fairly as possible, the life of the strong middle class of country people.

*

MANY of our correspondents from isolated sections of the West and Southwest refer to deficient school facilities, and the lack of opportunity to acquire culture of mind or manner. In many cases the children who are thus growing up with a handicap that must hamper them through life belong to good American stock. On the other hand, we see here, in our great cities, the children of unlettered immigrants not only given a good common-school education, but instructed in arts, sciences and social accomplishments, through public or private generosity. Every American feels that his land of opportunity should offer a generous welcome to all who seek its shores. Yet when we wonder why young America seeks the city, and deserts the sweet-smiling furrow for the grimy pavement, is it not possible that educational as well as social opportunities form a part at least of the lure? Philanthropy has showered wealth on collegiate institutions, while primary and secondary schools have struggled on limited public funds. We need an awakened public conscience towards the needs of the common schools in rural districts. It is well for us to educate the stranger within our gates, but there seems a growing need to consider, with equal force, the claims of those who are of our own household.

*

"Tied to the stake!" Every boy has read thrilling Indian stories wherein some unfortunate victim was securely tied to a post with the hot fires blazing around him. The boy has thought what *he* would do if some comrade were being tortured in this way. How he would rush through the crowd, stamp out the fire and set the victim free! A noble thought surely! Why let it disappear like other dreams of action? During the hot months of Summer you may find mother or the girls *tied to the steak* in the hot, stifling kitchen! The range may be defective and old, the fuel poor, the kitchen unhandy so that the only pleasure about dinner is in the eating of it—with mother too hot and tired to share. Here may be your chance to make "dreams come true" by starting a campaign for a better kitchen. Begin it now.

*

IN the last magazine issue J. M. Drew told of a play which is being performed by students of the Minnesota Agricultural College. The object of this play was to present in dramatic form some of the arguments in favor of an agricultural education. There has been a stream of letters from people who want such a play for performance in their home town Several of the colleges have asked for it. Why not make use of the stage for a clean, impressive argument for farming the same as we use lectures or moving picture shows?

*

The Cooking Stove a Pulpit.

The blizzard whirled in upon New York without warning, and filled the streets with great drifts of snow. People who live in the country rather like snow in Winter, for it makes good sleighing, and in almost every case the grass and grain are better following the snowy Winter. In this great city, however, the snow is naturally out of place and before the blizzard was over, a great army of men were put at work carrying the snow away. Most of it was thrown into carts, which were hauled east and west and dumped into the river. In other cases, the snow was shoveled into the sewers, where it melted and ran off. But this blizzard, while a great inconvenience to the city, had its good side, for it provided labor for thousands of men who were out of work. Every Winter when times are hard in the smaller towns, thousands of these men head for New York. It is no place for them, for work is scarce. Yet they come here hunting for a job, and many of them are partly cared for by charitable organizations. This snow-shoveling gave them a chance, and many of them embraced it. Squads of them were found in every street—many of them poorly clad and rather ill-fed for the work. It is small wonder that some of these ill-fed and poorly-clad men frequented the saloons for something to warm them up in the face of that blizzard. There were moralists who found fault with this, and held these men up as terrible examples of what ought not to be. There were others who took the more sensible view, and what they said and wrote, showed that there are practical, warm-hearted people in this city as well as in the country. One of them for example wrote the following note which was printed in a daily paper:

"As you look out of your window you will probably see a bunch of men at work shoveling the snow away from your street. Watch these men. Some of them are not used to the work. Most of them have no overcoats. Some have no gloves or mittens, yet they are cleaning up the city for us. Do not moralize and groan if you see one of them coming out of a saloon wiping his mouth, but get busy on the other side. Take two or three loaves of bread. Cut them into thick slices, smear on the butter so you can't see the bread. Put a slice of meat between each two pieces of bread and butter, go out to these men toiling in the snow and say, 'Now sports, we are all men and we are all hungry at times. Here is my contribution for the good of humanity. Go to it.'"

No more practical advice to reasonable men could be given than this. There is no use talking, but a good cooking stove still remains about the best pulpit on earth from which to preach a sermon on intemperance.

The Family on a Bobsled.

There has been snow enough throughout the northern part of this country for the past Winter to satisfy anyone who likes snow. In Canada the sleighing has been long and continued, and from present appearances will continue far into April. The younger people are fond of snow, and there are times when the entire family turns out to enjoy it. The picture here given shows a Canadian family mounted on a bobsled all ready for a mile-a-minute spin down a steep, icy hill. This scene could be duplicated

THE WHOLE CANADIAN FAMILY AT PLAY.

on thousands of farms visited by THE R. N.-Y. each week. We have readers in every country on the globe. This paper will be read by families in Cuba, Porto Rico, Egypt and in countries close to the Equator. The majority of these older people were raised in the northern part of America and will well remember the bobsled coasting of 30 or more years ago. They will hardly be able, however, to make their children and grand-children of the South understand this picture, for it is one of the wildest stretches of imagination for the inhabitants of a hot country to realize that Winter hardens water to such an extent that one could walk on it. These older folks would gladly take another spin down hill, and it would do their descendants a world of good to endure the biting cold for a few seasons.

The picture here shows one of the drifts which accumulated in one of the narrow New York streets. Some of the streets were worse than others, owing to the fact that the wind whirled the snow through some open place and piled it in front of the higher houses. Then the snow upon the sidewalk was thrown off and a track was dug through the center of the street, so that after the storm was over there were two great drifts or piles, such as is shown in the picture. In the country, of course, the snow is left to take care of itself. When the weather permits, it melts and runs away, but in this great city, all the snow in the streets must be scraped up and taken away. When we consider the size of New York City, we can imagine what it means to carry away all the snow which piles upon this big island. At one time during the storm 15,000 men and something like 3,000 wagons and trucks were at work clearing away for traffic. Some of our farm boys think they are greatly abused when they are called upon to dig a path from the house to the barn or to the road. What would they think of tackling the job of cleaning this great island of such drifts as are shown in the picture?

Eggs for Tickets.

A new way to help out the egg market was recently started at a town in Arkansas. A moving picture house hung out the following sign:

"Admission for minors one egg; for adults two eggs."

This meant an increased patronage and a good supply of fresh eggs. As there was ready sale for the hen fruit, it may well be seen that this turned out to be a very fruitful scheme. It is probable, however, that regular performers on the stage would have been shy about their appearance if this plan of admission had been adapted, for there are few performers on the stage who are not made nervous when they see a basket of eggs in front.

A SNOWDRIFT FROM NEW YORK'S BLIZZARD.

Spear's Room-Size Brussels Rug
Only $11.95
$1.50 Cash
Balance, 75c a Month
Order No. D 4736

Beautiful high color Brussels Rug, size 9x12, red rose design, green leaves and tan ground. Guaranteed full 9-wire Tapestry Brussels with wool facing. This is the greatest genuine Brussels Rug value you ever saw. It is perfectly safe to order direct from this advertisement, as we positively will refund your money if on receipt you are not satisfied with your bargain.

Bed, Spring, Pillows, Mattress
Complete Only $9.45

Order No. D 312 — $1.50 Cash
Balance, 75c Monthly

This handsome, complete Metal Bed Outfit, consisting of heavy, perfectly constructed Iron Bed, any color, 4 feet 6 inches wide; a good woven wire spring with all steel frame; 50-pound cotton top mattress; 2 feather pillows.

"I Will Trust You Gladly Wherever You Live" "I believe in every man who earns a living. I am for the average home lover—the man who wants home pleasures but hasn't a whole lot of money to spare all at once. My credit plan of buying is for him. I want to get acquainted with all those who desire to make their homes cheerful and comfortable. I can help them get what they want. Thousands are saying, 'Spoar helped us to beautify our homes on his liberal credit plan.' I want many more friends like that. Send for my bargain book now and let me explain how I give 'Credit to the Nation.'" — Spear of Pittsburgh

"Let Spear Make Your Home Sweet Home"

Open *your* charge account with Spear of Pittsburgh. He will trust you—no matter where you are—and save you money at every turn on all kinds of household goods on the most liberal and easiest charge account credit plan. No need to scrape and save for months and years. By Spear's plan you pay as you can—a little each month. You'll find Spear fair and square. He has no iron-clad rules and will be pleased to give you

30 Days' Home Trial

of any article so you can examine and try it out, right at home. If you don't want to keep it, send it right back at Spear's expense. Spear has many thousands of happy, friendly families on his open credit books. It's his life work. His whole heart is in it.

A Man from Ohio

wrote Spear of Pittsburgh, saying, "I wish you could see my home today. We are plain working people, but there is not a millionaire who enjoys greater comforts than we do in our home." Spear wants *you* to beautify *your* home without any strain on *your* pocketbook. Spear asks no unreasonable questions, does not let *your* neighbors know *your* business.

Try out Spear's plan by ordering any article shown here, enclosing first payment by Draft, Money Order or Registered Mail—or send for Spear's Free Book of Home Bargains now.

Get this Big Book—It's FREE!

Spear's big Free Bargain Book is just like bringing the choicest, handsomest stock of Home Furnishings—many times the size of even the greatest city store—right *to you*—to study over and choose from.

It is filled with pictures and full details of his liberal, modern, open account, long-time easy-payment plan. No mortgage, no security. Shows Thousands of Bargains in Furniture; Carpets; Rugs; Stoves; Portieres; Clocks; Go-Carts; Dishes; Ranges; Refrigerators; Silverware; Lace Curtains; Sewing Machines; Washing Machines; Mattresses; Springs; Bedding

New York's Latest MEN'S STYLE BOOK
Send for It
It's FREE

Men everywhere like to know exactly what the best dressed business men of New York are wearing. The Glen Rock Style Book tells you—tells you as well as a visit to New York. Page after page of men's fashion ideas. But this will interest you most—this booklet contains handsome Fashion Plates and 40 sample pieces of the very woolens which New York men consider "the thing" this very minute.

So much for style. Have you ever worn a Glen Rock suit or overcoat? If you have, you know that the fit is perfect. You know that every detail of tailoring is most expertly done. You must know that every Glen Rock garment is made from good material, for garments which give you such long wear as "Glen Rocks" do are made only of good materials. Prices all the way from $10 to $22.

Here's the "Glen Rock" plan. Every garment guaranteed a perfect fit and stylishly made. Because we sell to you direct (from the mill) we save you at least $8.00 on every suit or overcoat. You see you save the retailer's profit. Get in on this plan. We save you money! We want to make you a friend of ours.

THE LAND OF FULFILLMENT

A STORY OF HOMESTEADING

By ROSE SEELYE-MILLER

(*Continued from page 302, February 28.*)

"All but the creek claims, they weren't taken when I drove past but may be now; still nobody wants the creek land, it's too rough, steep hill, and low valley, and steep hill again."

Nate and Norm looked at each other blankly.

"What can one do about this vacant, unsurveyed land?"

"Oh, nothing, except to 'squat' on it, and hold it till it comes into market.'

"When'll that be?'

"No telling, when a railroad goes through I reckon, nobody knows when that'll be."

Norm turned the oxen and headed them east again towards the despised creek land. Both boys were keenly disappointed. They had been passed by many teams that day and most of the drivers had been urging their horses to the full limit of their speed.

"I understand now, why all those fellows were in such a hurry." Norm said moodily. "We'd ought to have taken up our land while at the Land Office."

"Oh, I don't know," Nate demurred. "I'm thinking that creek land will be just about what we want."

"You wanted to file right there in the office and you know it," Norm stormed.

"I've changed my mind since then," Nate retorted. "I think that creek land, will not be too Edenic. It'll likely have some stones on it, and after travelling seven miles to get a piece of stony land, I'm not going to let a good chance slip. What do we care about the land anyway? It wasn't really the land that we came after, but health and comradeship, so that we could go back, and do something in the East."

"Probably someone else has taken it before this," but Norm hurried the oxen at a speed hitherto unknown to that faithful and steady-going pair. Arrived again at the creek side, the boys stopped a moment, listening to a cluster of men debating, judging from what they heard, the creek land was not taken. Norm drove on to it, drew out the nails that held the "coop," on to the wagon, and then making a slip-plank of a couple of heavy boards, the two boys slid the shanty out on to the ground.

"What are you doing here?" inquired an angry voice, and the speaker backed up by several other men, most of them mere boys like Nate and Norm, approached them wi angry resistance written on their faces. "The creek is for everybody, and not for settlement."

"It might have seemed so a few minutes ago," Nate replied coolly, but now it belongs to us, and we're going to hold it and homestead it."

CHAPTER IV.

"You've only got one quarter section held with that shanty anyway," a young and kindly voice put in.

"Only one? Are we entitled to one quarter section each?" Nate turned swiftly and looked into the clear hazel eyes of Jim Maynard. "How can we know just where our land begins and where it ends?"

"You can tell about where you are by the corner posts. At every corner of every section, the surveyors dig four holes and make a heap of dirt in the centre, often placing a stone on the heap. Here," pointing to such a place, "is where my land ends, and yours begins. Tie a rag to your wagon wheel, and drive along and count the revolutions of your wheel, from one corner post to another, then you can easily tell where the line is between two quarter sections almost anywhere."

"Good!" cried Norm, brightening visibly, and Nate knotted his handkerchief about a wheel.

"If we hold a half section our joint land will run from one corner post to another and the line between the two quarters will be the dividing line between our two claims."

"Yes, and the land will run half a mile east and west. The creek right here is running north and south," explained Jim. "You can shove your shanty over on to the line and hold both quarters, that way till you can get your other one built."

This little, friendly encounter, cheered the boys a great deal, but both boys and oxen had put in the most strenuous day of their lives. But the bracing air, the glorious sleep, out under the open sky, caused them to waken feeling refreshed and strengthened.

"I feel like an inflated balloon," Nate declared as he went about getting the simple breakfast. Then before the rest of the settlers were stirring, (most of whom were young men of their own age or a little more) Nate and Norm were lumbering cityward with the best speed the oxen could make.

The crowd at the Land Office thinned at noon, and Nate and Norm stationed themselves on the steps to wait for its re-opening after dinner. Mr. Stamford gave them a few extra minutes, and the boys explained the situation.

"So you were crowded out? I was afraid of it. Men are so crazy for land, they file on any plat here, and then run for it. It isn't a very good way or a just way, but that will be changed in years to come, but just now we must meet the problem as it is. There is no doubt the land unsurveyed and out of the market will be better than this land on the creek, but if you want this said land, there is no reason why you should not have it. Why not file on both a preemption and a homestead each? This will give you a good square patch of land, and while some of it will be practically worthless, some of it ought to yield good results. The rough land will do for pasturage."

And so, Nathan Lee, aged twenty-one, with a very slight margin over, became a land-holder, and upon the same date, Norman Duane, about the same age, profited by Uncle Sam's beneficence. The boys paid their fees, bought some lumber and a few things they considered absolutely needful, and went lumbering homeward.

"It is funny," said Nate viewing the plains, "how many buffalo bones there are out our way, and so few nearer the city."

"There isn't anything funny about it," Norm retorted. "Can't you figure out two and two? The people who have settled on all these quarter sections have got rid of the bones, that's all."

"I can't see what they've done with them unless they've kept throwing them west, off their own land on to the next claim. I believe that is just what has been done, for they can't burn them, and they won't rot in years. Maybe," Nate added pensively, "these bones have been piled up for me to use. Lacking stones, I can pick buffalo bones. They're lighter and easier to handle, and enough to keep me busy for a long time."

"And that's your idea of agriculture!" snorted Norm.

"Doesn't it make you feel plenty rich to own three hundred and twenty acres of land?" Nate added dreamily, ignoring Norm's snort.

"It does, and it does not," admitted practical Norm. "You don't seem to realize that we have to live on our homesteads five years, and that we have to pay about two hundred red-hot dollars for our pre-emptions when we prove up. My mind just now, strange as it may seem," mockingly, "is bent upon the problem of how we are going to live, and move and have our being, until our wheat crop begins to roll in."

"I'm afraid you've about used your nest egg up, haven't you?"

"Eggs don't hatch just lying in a basket, they've got to be set."

"I sure hope yours hatches," observed Nate heartily, but after all I feel like a swine—letting you—"

"Shut up," responded Norm promptly. "It's for better or worse, you know we agreed to that, when you let me come with you."

"Let you?" and there was great emphasis and great meaning in Nate's words. "I hope—but it's an unequal partnership. You with your splendid strength, your nest egg, and me with—"

"You with a cough—if you'd give up that bad habit, I wouldn't ask much more of you—"

"Oh, pass out your pledge—no, wait a little, I guess I'm going to break it right now," and Nate began to cough violently.

"There, you see, just mention it, and you begin. I notice you cough a lot more when you happen to think of it than when you are plum interested in other things."

"Maybe it's so, I don't cough nights now. I'm so interested in sleeping, and truly, this air is like breathing heaven—I'm bound to quit."

The boys lapsed into silence, both speculating upon their land, its probable value, the experience before them, and the glory and the gladness of possession entered into their souls.

"We'll make good," said Nate as they drove on to their own soil.

"We'll make good," assented Norm. "And we'll stand by each other forever."

It was mid-afternoon, when they reached home, and after tethering the oxen, feeding the few hens, and making things comfortable in general, both boys set to work to fix up the inside of the shanty. They made a bunk, and put it on hinges, for a sleeping place, and when this was not in use, it could be put up out of the way. Nate suggested a table on the same plan, so a broad shelf was put beneath a small window which they had inserted in the shanty, and this too proved a great convenience, for there was so little room, it must needs be carefully conserved. Some corner shelves were put across one corner, for the few dishes and nails were driven in beneath this, for hanging the skillets and utensils on, and so the little shack on the plains began to look quite properly a bachelor's shanty.

"When do they plow and put in a crop?" inquired Nate innocently.

"You are a practical agriculturist," Norm laughed. "Out here they put a crop in, in the Spring, but back home, they sow a good deal of grain in the Fall."

"Well, I don't see why not here too! Can't we even begin to farm till next Spring?" Nate's voice was full of dismay and disappointment.

"The Winters are too open here; the grain would freeze out, if put in in the Fall, if it wasn't quite so late, we'd try putting in a few acres of flax, they raise the dandiest stuff on the virgin sod here! But it's too late!" There was a ring of finality in Norm's voice.

And so the matter rested, but the next morning after the other work was done, Nate took up the topic, as though it had been dropped but a moment before. "But we've got to do something!"

"We have. We have another house to build on the other half section of land, but before we do that we'll look over our land some. I see we own a large round, basin of land; it must have been an old lake bed, with banks like the sides of a cup, and through this little valley runs the creek. This upland looks all right enough, but that valley land will be richern' skim-milk, or I miss my guess."

The banks of the old lake were precipitous, and the boys had to hunt for a place to make their descent into that part of their possessions. Finding the least steep place, they made the descent, rather more hurriedly than they had expected to, for the top soil proved to be but a scale, and beneath it was nothing but loose, crumbling shale, that gave way with every step. Norm, heavy and less agile than Nate lost his footing and went rolling to the bottom, but Nate by expert balancing, and light, skimming of the surface, reached the ground upright. Both boys laughed and laughed, and then Norm recovering his gravity, rolled about in the grass, long, thick, luxuriant.

"My, but this grass is some wonder. If we had this back East we could make a little fortune cutting it for hay—but folks don't put up much hay here, they say the stock range all Winter and come out fat in the Spring, feeding on the dry buffalo grass."

"If this bottom land is so good, what about the hillside? That crumbled away like clear lard, that must be an extra fine soil." Nate observed, with an owl-like look of wisdom.

"That," snorted Norm. "There isn't soil enough there to grow bird feed! That," and he gathered a handful of the shale and sifted it through his fingers, "That," he repeated contemptuously. "I don't know what on earth that stuff could be good for!"

"'Speak gently to the erring'," Nate replied mildly, smiling at Norm's scornful denunciation of his judgment, and of the land judged.

"I wonder if we couldn't plow up just a little piece down here for a garden," Norm speculated. "I believe these bluffs would protect it from frost, and the ground is so rich, things would grow like Jack's beanstalk."

"You'd have to get the grass off someway," suggested Nate, wisely.

"Oh, wise agriculturist!" cried Norm, "I'd cut the grass and plow the land," then his exultation in his own superior wisdom oozed away. "But I haven't any plow."

The boys had been moving along, and suddenly around a sharp curve in the bank, Nate espied a monstrous heap of white. "Bones!" he cried. "Bones, bones everywhere and not a bone to pick!" but he bent to the pile and touched them with a feeling of half awe and reverence. "This is fairly uncanny! Norm! Did the buffaloes have a burying ground here, or did they come here to jump off and commit suicide? There's a carload of bones right here—I wonder—" But what Nate wondered remains a secret, for Norm broke in stormily.

"The neighbors are using our valley-land for a dump heap," and in verification of this statement, there came a shower of bones flying down the side of the embankment.

"Hey there!" shouted Norm indignantly, but Nate's hand shot out and shut off Norm's vocalization.

"Isn't that Maynard? the fellow who was so good to us? and moreover he's got a shining red plow; I saw it. Tell him you'll let him use your land to dump on, if he'll lend you his plow!"

"Hey!" shouted Norm, and in reply to the shout came an answering cry, and a pair of bright hazel eyes looked down upon them.

"Hope my impromptu shower, didn't hurt anyone," said Jim Maynard's boyish voice.

"Not a bit," Nate responded cordially. "We've just decided that we won't kick on being used for a dump, if you let us take your plow for a little while."

"Why, you can take the plow and welcome," Jim replied heartily. "But it's too late to plow anyway, and if you think of breaking up that valley, it's all foolishness, for it'll be covered with water likely sooner or later."

"It doesn't look much as though it had been under water for a good while," Norm said, not very pleasantly, "but I want to turn up a little land for a garden."

Norm was prodding away with a spade, turning up the blackest, richest kind of soil. "See that!" and Norm turned up another spadeful of soil. "It's rich enough to raise pie crust on—if we could only get the seed."

"There's no doubt about that, but pie-seed are scarce out here. It's jolly fun baching it, but it's jolly lonesome too. Say, I was in hopes one of you fellows would fetch out a piece of calico with you."

Both boys laughed. "No calico here. We're all boys together 'round here, and it's no fit place, for a woman just yet," Jim continued. "But I'm homesick to see a gingham apron."

"I'll get one, first time I go to the city," Nate agreed accommodatingly, "and I'll put up a clothes line, and keep it hanging out for the benefit of sore eyes."

And so with a laugh of good fellowship, Nate and Norm, made their way along the creek bed, to the road which lay just on the south line of their land, and then on up the hill there, where Norm got his oxen, and the plow, and all three boys set about making a garden patch.

"This'll be almost as good as a piece of calico," Jim agreed, as he watched the oxen lumbering along and turning up the richest soil the sun had ever shone on.

"I've got a dozen potatoes over to my shack, and a package of government garden seeds, which I will donate for the satisfaction of seeing this truck patch once in a while," Jim volunteered generously.

"Dump all the bones you want to," Nate replied hospitably, "and I'll help you pick up too."

And so it chanced that lettuce and radishes, young turnips and string beans, beets and a few potatoes began to grow upon the virgin soil of the valley plat. Jim and Nate picked bones assiduously, and when Jim's quarter section of land was picked clean, they both began on Nate's land. "We'll have that valley plum filled up," Jim averred gaily.

"I'm going to begin pounding them up for our six hens," Nate said happily. "They're prime good for hens, and ours are laying now. We're going to set one just as quick as we can."

That night after the dishes were washed Nate began making poultry feed out of the bones. He used a big stone, for a base and with a smaller one he pounded the dry bones up into scraps, and although it was time for any respectable fowl to be to sleep, the six flocked about him, picking up the falling spray. And as Nate watched how greedily the hens ate the bone scraps an idea, dim, vague, came into his mind, and he wondered vaguely if there were such a thing as a bone-cutter, and finally dispatched an inquiry for a catalogue of poultry supplies.

"Terribly rough, homely horns, these buffalo horns!" Jim essayed one day picking up a monster pair that lay near.

"I supposed horns grew as smooth as glass," Nate exposed his ignorance shamelessly. "I've seen whole windows full of horns in the city, as shiny as looking glasses."

"Huh! City horns are polished up like city people, and don't look any more like natural horns, than dudes do like men," Jim aired his superior wisdom freely.

"I wonder what color these horns really are," and Nate took out his jack knife and began cutting away the outer roughness.

"We could find out easy enough by trying one on the grindstone. If you want to scrub up some, we'll take them up and find out."

"Let's do it. We can fix up a pair apiece and keep them to hand down in years to come."

So at noon, the rough buffalo horns were tried upon the grindstone and much of the rough, checked, outer covering was ground off, revealing a horn as black as ebony, and about as hord.

"I believe they would polish up in great shape; we'll fix some to hang our hats on."

"They'll need scraping with glass, and rubbing with emery paper and rotten stone and oil, to put a final finish on them," Jim agreed. "I've got about all the junk in my shack that I want, but I'll help you fix some."

And so the remainder of the Summer drifted by. All the young settlers were busy, without accomplishing anything that turned into real money, and money seemed to be a very vital part of life in a new country, where everything was high and luxuries scarce. Nate and Norm had built the other shanty and had fitted it out reasonably, but both knew that their resources for the long Winter were pitiably inadequate. It is true that Nate had picked bones and fed the hens bountifully, that these same hens were laying well, and furnishing as many eggs as six hens could be expected to do, but they could not furnish a living for two hungry boys. Nate had, been thinking seriously for a long time, wondering, what he could do to add to their financial exchequer. He knew that the buffalo bones would be an asset, if they could be shipped to some fertilizing plant. The nearest railroad was 20 miles away, so that shipping seemed hardly feasible just then, but he hoped sometime to utilize those bones, although this had not occurred to him at first, and he meant, should he realize any profit from them to share with Jim Maynard, for he had worked as hard as Nate had, to pick them up. Still the clearing of the land had been the chief, and only object to Jim, while to Nate, the keeping out of doors, in the clean, dry air, was the main thing. To be in a pleasant companionship, and to be occupied in a light way, meant a good deal, for it kept both boys from dullness, and Jim perhaps from homesickness.

The Woman At Law

[Under this heading we shall discuss the legal rights of women, particularly as regards their property and their children. There will be direct answers to actual questions and general statements of law.]

Wife's Right in Husband's Property Against His Will.

If a man dies, leaves a will and a widow without children, and she decides not to abide by the will, what portion of the estate is she entitled to in Pennsylvania? W. H. C.

In Pennsylvania a husband cannot by his will bar his wife from participating in his estate at his death. A widow may always refuse to accept the provision made for her by her husband's will and elect to take dower, which is a life interest in one-third of his real estate. But this does not cover all of her right. By the Act of April 1st, 1909 (P. L. 50) the widow of an intestate, if there be no children, is entitled to the real or personal estate, or both, to the aggregate value of $5,000 in addition to the widow's exemption of $300. If the value of the estate exceeds $5,000, the widow is entitled to such sum of $5,000 absolutely and in addition one-half the remaining real estate for life, and one-half the remaining personal estate absolutely. These latter provisions take the place of the dower right. The wife, electing to take under or against a will of her husband's shall manifest her election by a writing, signed, duly acknowledged and delivered to the executor or administrator and recorded.

Notice of Reading of Will.

Can you inform me what the law is in Ohio in the case of the reading of the will of a deceased person. Must all heirs be notified of the time of the reading of the will or not? In this case some of the heirs were notified and others were totally ignored.

There is no law in Ohio in regard to giving notice of the reading of a will, and if, as is sometimes done, the relatives of the deceased gather to hear the will read, it is more a matter of custom than of law, and it is in the discretion of the person who has the will in possession as to who shall be notified of its reading. But it is provided by law that no will shall be admitted to probate without notice to the widow or husband and next of kin (who would be the children, if any, and if none, then to the brothers and sisters, etc., of the testator) if any, resident in the State, in such manner and for such time as the Probate Court directs or approves.

Husband's Right Under Wife's Will.

If a farmer making deeds gives his wife (with children) all of his farm and possessions, does he get any of this property back? If his wife dying makes a will giving some to children and a part to husband for life only, does the law give any to him in the same way as a wife gets one-third dower?

In this case, the property belonging to the wife, the husband gets just as much as his wife gives him under the will. In South Carolina a husband has no right similar to the wife's dower right; that is, his right as tenant by the courtesy was abolished in 1883. You would therefore be entitled to just as much as you are given under the will.

Gift of Real Estate.

A man deeds one-third of his property to his wife and the remainder to one son. There is a family of children. 1. Is the son's deed good, that is, can he hold the property, or can the deed be broken? 2. Can the wife get any more than her deed specifies? 3. Would debts incurred for her and her family just before and after the man's death have to be paid out of her share? S. J. B.

1. It is not shown whether the deed from the father to the son and wife is in the form of a gift or whether there was consideration from the wife and from the son. In any event, a man can give his property to whomsoever he wishes, provided he does not do it to rid himself of his just debts and defeat the claims of his creditors. If he is solvent he can give his property away and, in this case, the deeds to the wife and son would be good.

2. The wife should have joined in the deed to the son to release her dower right; otherwise, her dower right in the son's property would still be good. In other words, a husband cannot defeat his wife's dower by giving property away.

3. If the gift was consummated before the man's death, property given to the wife would not be liable for any part of his debts. Neither could the son's property be taken for debts incurred by the father, but, of course, if the debts were incurred by the wife and family and not by the husband, they could look to her property for payment.

Wife's Dower Rights.

My deceased husband left no will. He owned houses covered with a blanket mortgage. The law gave me five thousand dollars in this real estate, which has drawn five per cent. interest. Is there any way for me to obtain this whole amount of five thousand dollars from the real estate without a forced sale? Or could I place a second mortgage on the property and obtain my money that way? Husband's relatives say half of net income belongs to them and I find myself financially embarrassed. M. E. S.

Massachusetts.

You do not make it quite plain in your letter by just what means the $5,000 interest in the estate was acquired by you. If it was not set out to you by the heir or the owners of the freehold according to law, nor assigned to you by the Probate Court, you may recover your dower interest by what is known as a writ of dower, which is an action to obtain your dower rights and damages for the detention thereof. By this action you get a certain specified part of the real estate, and after this is set aside, you may mortgage your interest in it. You must remember that your dower right is only a one-third interest in your husband's land for your life. It would be impracticable to put a second mortgage on the property. The most feasible plan would be for the heirs to pay you the sum of $5,000, if that has been declared to be the amount of your dower interest, or it may be that you may be able to secure a loan on this dower interest.

Minor Girl's Rights.

Will you state the privileges that a girl has before she is 21, according to law, in regard to keeping company and getting married without consent of guardian or parents?

The authority which a parent has over a child is not limited in any way except that it must not be so used as to endanger the child's safety or morals, and the parents have, therefore, the legal right to say what company a girl shall keep until she becomes of the age of 18 years in this State, when she obtains the right by law to consent to marriage. Until this time, however, she must obey her parents in all things, limited only by the statement made above, that the authority shall not be so exercised as to endanger the morals or safety of the child. A girl may not marry in this State before she becomes 18 years of age without her parent's consent. For other purposes than marriage the female becomes of age at 21 years.

Hambden Girls' Tomato Club.

In early Spring the movement was started to form a girls' tomato club. Those interested met at our central school house and the club was organized. The girls held a meeting each month or oftener as necessary, presiding at their own meetings generally. Under the rules of the club the girls were allowed to raise or buy their plants, as most of them were attending school. Their fathers made ready one-tenth of an acre of land; they planted their own crop, but had help about cultivation. The rest of the work was done by the girls. The season was very unfavorable, with a heavy frost June 10, which killed many of the plants to the ground. Later the drought hurt them badly, but the girls worked with true country grit, and despite the dry rot they made the following splendid records. Two of the girls had previously lived in town: Maude Mansell, 127 bushels, $83.69; Augusta Staple, 55 bushels, $27.42; Laura Parker, 43 bushels, $5.20; Dorothy Shattuck, 32 bushels, $5.70; Lois Bartlett, 80 bushels, $3.50; Beryl Maltbie, 18 bushels, $4.30. Some found market for green fruit and some on account of school work in the Fall could not dispose of their fruit, but all did some canning, and had good wholesome experience in connection with their work. They gave a play which was a splendid success, at which time they sold homemade candy that reflected honor on the helpful makers. In all they earned $21.52, which was divided equally among them at the end of the contest. One girl said to me: "I should have made twice as much had I raised potatoes." In this she was right. Our country girls have a chance to make their own money if they will only take the opportunities that lie at their door. One of my girls before the frost placed 250 sap pails over her young plants, and saved them from the June frost. MRS. JAMES LAMPMAN.

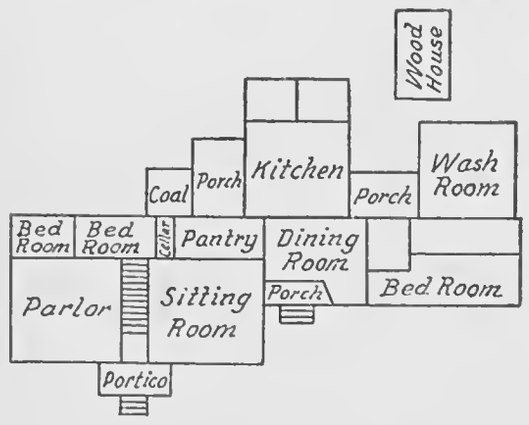
Rearranging the Farm House

A Study of Household Management

By A Farmer's Wife

PART I.

Within the past few years a number of articles have been published in the rural papers about the rearranging of farms; laying out and fencing the fields in such a way as to minimize time and labor, and there is no question that these suggestions have proved helpful to many readers. The same idea is just as applicable to the farmhouse as to the land. A large per cent of the older farmsteads were built in a rambling manner, caused by afterthoughts in the shape of



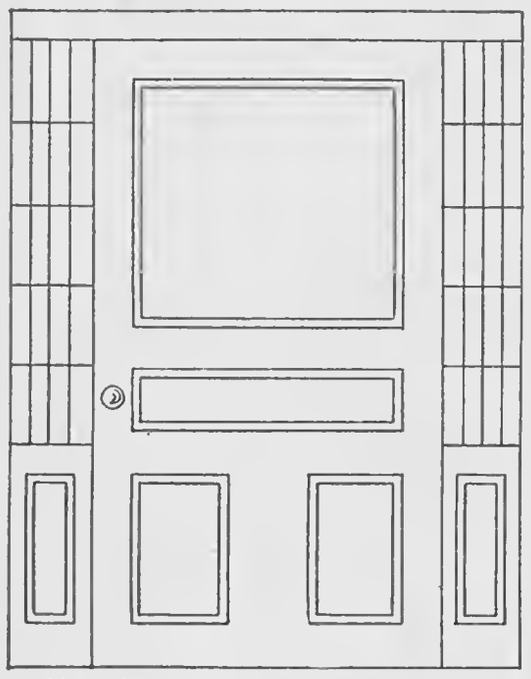
HOUSE PLAN AS IT WAS.

wings and lean-tos being added as the need for extra room arose. To rearrange and modernize one of these houses in order to make the housework easier and render life more comfortable and pleasant is no small task, and in one case has covered a period of a good many years.

Following the plan of the above mentioned articles I give a few diagrams, showing changes made, as I believe by this I can make myself better understood.

The reader will notice that we had a very small hall with stairway leading from it, between the parlor and sitting-room. These were removed and double doors placed between the two rooms, so now our parlor is "one of the family" and we do not feel away from home when in there. The outside door of the little hall had a very narrow window each side of it, extending over half way down from the top casing. A good-sized glass was fitted in the door, and little shelves made of basket covers were placed at regular intervals across the windows and filled with books, giving an attractive appearance and furnishing extra bookcases, while door retains its original effect upon the outside.

A large window 5x6 feet was purchased, together with the frame made to fit it. Then my husband and sons removed the two front windows of the sitting-room, placed the large frame in position and filled around it. A two-lighted sash was bought for the remaining window, the cost for all being $13.50. The stairs were placed in a portion of a pantry, so they lead from the dining-room, thus bringing the upper rooms much nearer and saving much travel and wear of carpets. The remainder of the pantry was converted into a bathroom, which is thus conveniently located near the stairway. The small inset porch was taken into the



THE HALL DOOR AS IMPROVED.

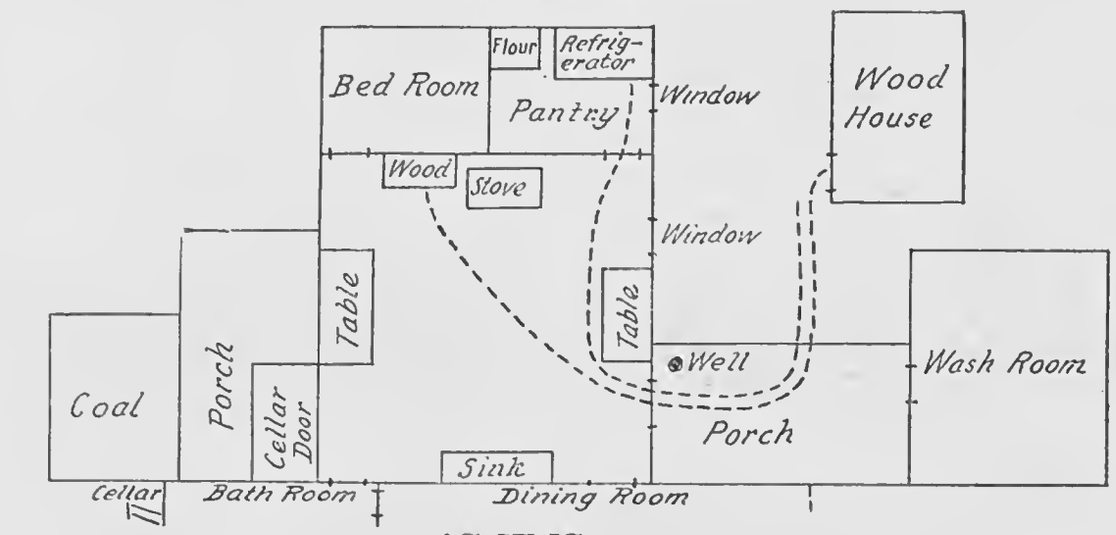
dining-room and double doors placed between that and the sitting-room, thus throwing the three large rooms together. The little portico was taken down and a large porch built instead. The partition between the two bedrooms adjoining sitting-room and parlor was taken out, making one good-sized room, from which a door was cut leading to bathroom. This brings us to the kitchen and its accessories, the pivot of the farm.

THE R. N.-Y. never uttered a truer statement than one in a recent issue, viz., "The most important room is the farm kitchen; the most important asset for the equipment of that kitchen is an unlimited supply of dry fuel and pure water." Our kitchen (and by this term I mean also the adjoining rooms that have a direct relation to it) has received more thought and attention than all the rest of the house. The old adage that "A penny saved is worth two earned" might well be paraphrased to read, "A step saved is worth two trips to a doctor." We have endeavored to eliminate all work and travel possible, not only for the household workers, but for the outside workers as well. I give a more detailed diagram of the kitchen that I may better explain improvements made.

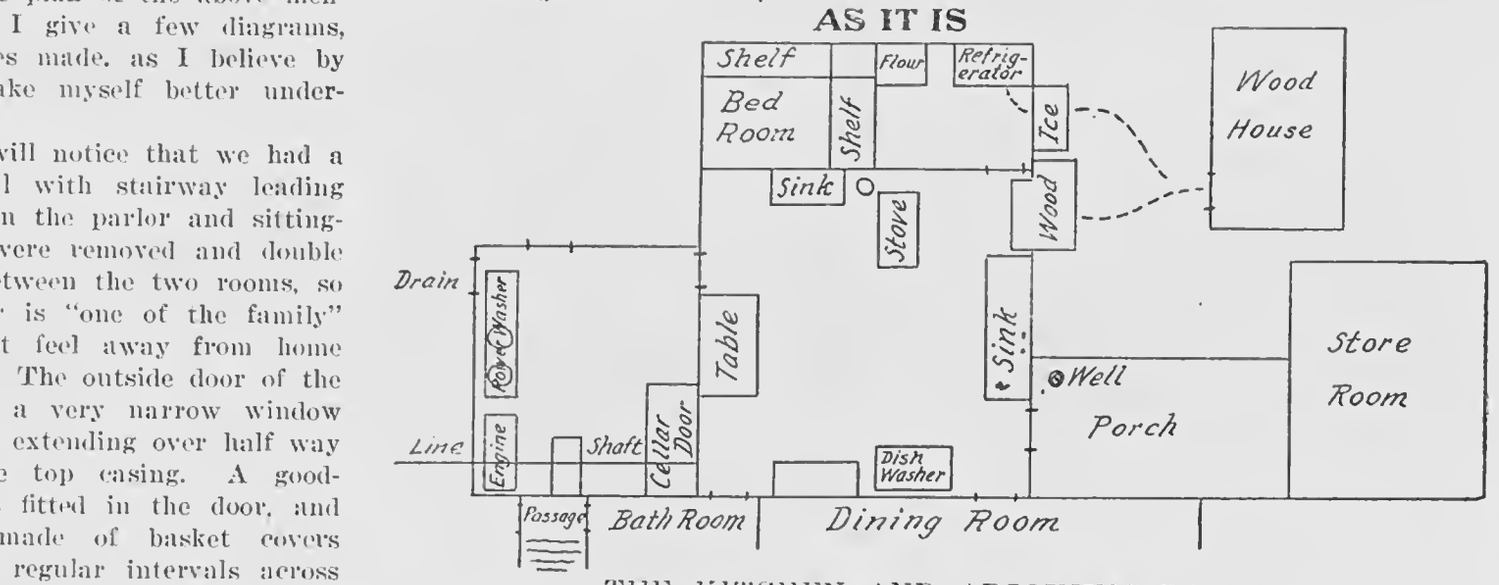
Formerly the sink stood next to the dining-room wall, in order that the pump might be directly over the cistern, but had no leader. My husband made a large, shallow box 7x2 feet by 3 inches, and taking it to the hardware store had it lined with zinc, and a leader put in. This was then placed against the outside wall, to the right of the old sink, and adjusted high enough from the floor so the worker need not stoop while performing her duties. It was fastened in place with spikes and braces. A broad shelf covered with zinc was fitted to the top of it, and will slide from one end to the other, or can be removed entirely. This shelf makes an ideal kneading board, much more sanitary than those made of wood. Two drawers made of boxes were hung underneath; in one is kept spices, soda, etc.; in the other pie and cake tins.

Above the sink we put a series of shelves, one of which was slanted towards the back to hold the rolling pin, and curtains in front complete this cupboard. The pump was placed against the end of the sink, and this necessitated laying a horizontal pipe under the floor to the cistern, which was well packed in sawdust and has never given any trouble through freezing. Behind the sink was an ordinary window, which was taken out, and an opening made even with the top, large enough to hold a

AS IT WAS

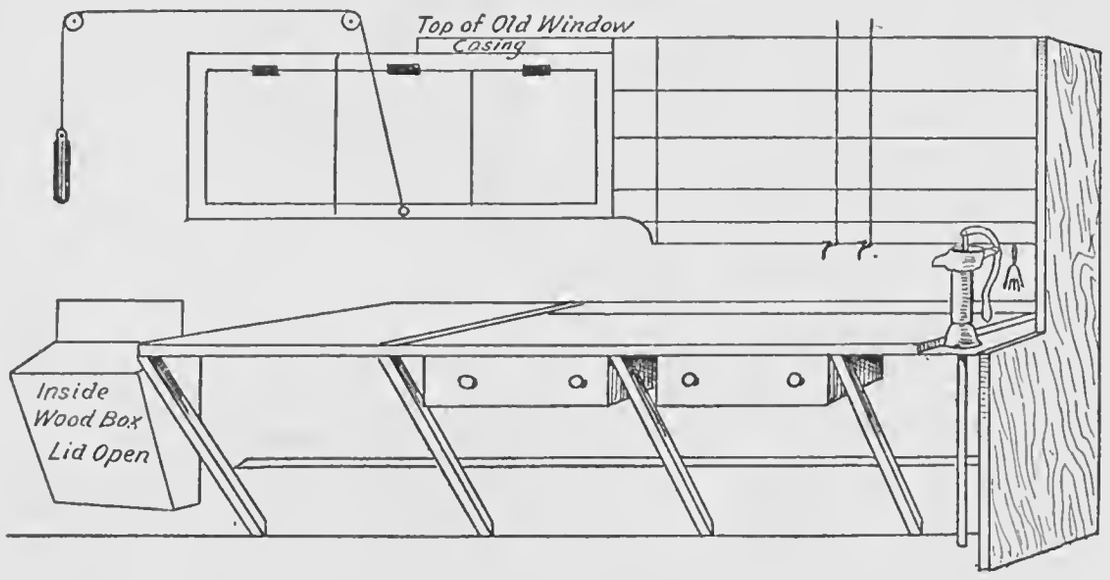


AS IT IS



THE KITCHEN AND ADJOINING ROOMS.

window frame made for sash containing three 16x20 panes. The lower part of the old window was closed up. The new window was hung with hinges and adjusted to run open with a pulley, and is held in place with a weight. This window is a great comfort in warm weather, as it creates a large opening on a level with the worker's face. Buying it with the frame to fit it made it easy to place. The zinc lining was a poor investment, as it soon wore through. We then had one made of galvanized iron, which has lasted many years, and barring accidents will last as many more. This equipment, shelves, drawers, window, broad

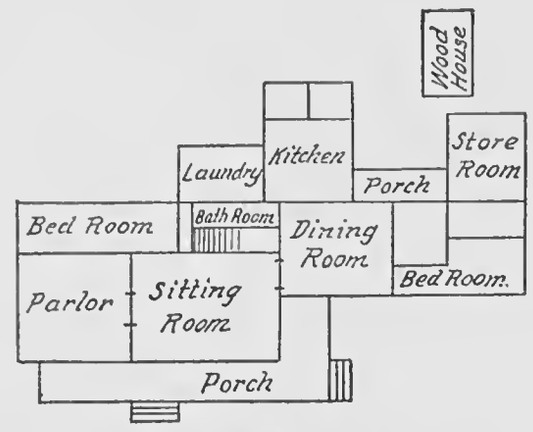


SINK AND SHELF CONVENIENCES.

shelf and sink with hot and cold water, make a very commodious home-made kitchen cabinet, as nearly everything needed is within reach of the worker. The pump, owing to the water system, is now useless, but the well being just outside, it is our plan to pipe to it and thus bring that water to the sink also.

Beyond the sink in the corner is the double woodbox, made partly inside but largely outside. This is a step saver, in earnest, for the men. Notice in the first diagram of kitchen the dotted line which shows the trip required for each armful of wood, making miles of travel in the course of a year. The new wood box, as you will notice, is made with a lid inside and one outside, each being held up when needed by a little wooden hook which drops in place as the lid is raised.

While here at the pantry door let me show you another step saver for the men. Note as before the trip made to carry the ice around through the kitchen into the pantry to the refrigerator. A happy thought came to us. After years of this traveling and attendant dripping, we now have a broad shelf on the outside of the window (which is very close to the refrigerator) built on a level with the window sill, whereon can be placed

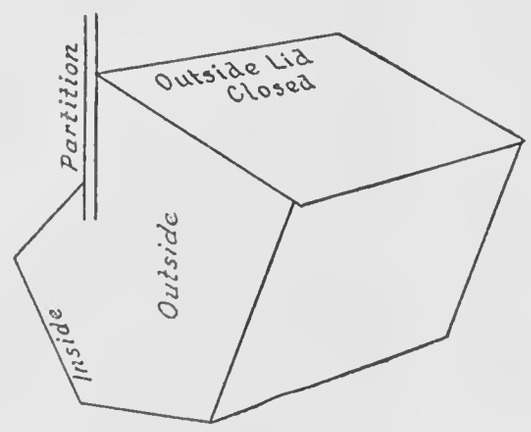


HOUSE AS MADE OVER.

enough ice to fill the box; then donning a pair of cloth mittens, the farmer-iceman goes into the pantry and places the ice where it belongs.

Another glance at the diagram shows the kitchen range turned around so it projects into the room, and will also reveal what a great improvement this is, as the stove now faces the sink, and the worker can easily turn from one to the other without taking a step. This range is unfinished upon the back, and I judge they all are, as they are intended to set back close to the wall; hence we annually give it a coat of aluminum paint, i.e., the whole of the stove except the top and shelf. This is much more satisfactory than blacking and lasts the year through very nicely. Directly over the range we cut a hole and cased it up with boards like a box. This makes a fine outlet for steam, smoke and heat, going into an attic.

Behind the stove is the hot-water tank, and beyond this another sink 20x30x6 inches, used primarily for lavatory purposes. When planning this sink we made inquiries at our local plumber's for a sink fitted with a rubber stopper instead of a strainer. We could get no satisfaction, and began to look elsewhere, and finally succeeded in locating one through correspondence. By putting in the plug the sink is converted into a nice washtub for hosiery, or any extras we may have to wash out, and do not wish to use the regular tub. It is very convenient, with hot and cold water, and cost 25 cents extra for the rubber stopper. Here we arrive at the boot room, the tidy (?) appearance of which I will not mention; suffice it to say that it contains boots and shoes used upon the farm: coats, hats, parts of harness, etc. A shelf three feet broad has been placed across one side about 30 inches from the floor, and another two feet broad higher up and across the other way. On these are kept the things dear to the heart of the average farmer—a box of harness tools, bolts, snaps, straps, buckles, a shoe



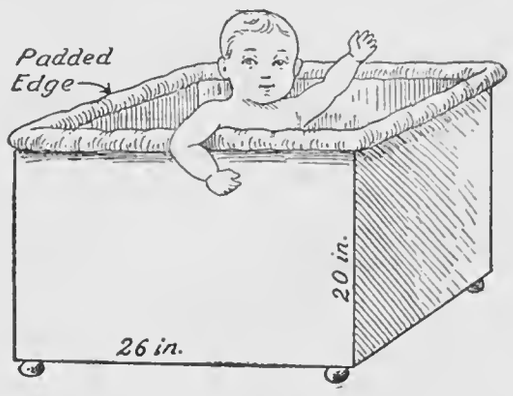
DOUBLE WOOD BOX.

repairing outfit and other articles too numerous to mention. A glance shows the room to be well furnished if not artistically arranged.

Where the original sink stood, is now an old-fashioned bureau, the legs of which were sawed off to make it set close to the floor. In this are kept kitchen aprons, towels, cloths, etc., and what has proved a comfort and step saver, extra pairs of the men's everyday socks, and handkerchiefs.

The Baby Box.

The biggest help I have found in home-making is my "baby box." In it he is safe from harm, no cold draft on his little feet, nor danger of burns from touching the hot stove when mother is busy. As I have never seen one like it, will tell you how I made it. I took a nice clean box made of smooth boards. It is 20 inches high and 26 inches square. I gave it a coat of dark red paint inside and out; then I cut strips of an old quilt and rolled them so to make a solid roll about two inches through, and long enough to reach around top of box; sewed the edges



BABY IN BOX.

over and over so it would stay in the roll, then I tacked a strip of stout ticking folded double so it would hold all around the top of box inside; laid the roll of quilt on top edge of box, brought the ticking up over the roll, drew it as tight as possible and tacked it smooth on outside of box, thus making a padded roll edge on which baby cannot bump his little chin. Over the ticking I fasten another cover of red calico which can be renewed when soiled. The box should be of half-inch boards, or else have an extra piece nailed on around the top, or the tacks will prick through. On the under side of box fasten on each corner a plate castor with four screws, thus raising the box from the floor so it is easy to roll anywhere, up by the window, so baby can look out of doors, or close to the fire when baby is cold, and feel safe that he cannot fall and burn himself. I fold a soft blanket and lay inside the box for him to sit on, and be plays there happy as can be with his toys.

New York. CORA HAMILTON.

SOUTHERN CREOLE COOKING.

"POSSUM AND TATERS."—I have eaten them cooked in stoves at home, and they were good, but one shining specimen looms up o'ershadowing all others. I wonder if the old mammy that fixed him up is still alive? She ought to have a monument, and a baked 'possum on top of it. It was 'way up in the cotton country, where there are nine darkeys to a white man, and on a cold January day, about dark, when we came in after a hunt. Old mammy with her head in a bandanna did her cooking in a big rock fireplace, in pots and pans and skillets, and had roasted us a couple of 'possums that way, with "yaller yam taters" with them, not the white gun-wadding kind that would choke an ostrich, but the "yaller" ones that run sugar. That 'possum and those "taters," and the way they were cooked, and the gravy! We forgot our manners, and just sopped it up with corn pone or biscuits, and washed it down with black coffee. Why, the things that old black slave, who could neither read nor write, could rake out of an open fireplace and a skillet, make Marion Harland's scientific messes look hardly fit for pig feed.

THE POULDEAU.—Then visions of pouldeau flit through my think box. The pouldeau is not a duck; it is a kind of water hen, and lives on shrimps, worms, minnows and other small live creatures. If fixed like a duck or goose it is so fishy it is uneatable, but a good French cook skins the animal and soaks him in vinegar and water a little while, and prepares a stew, pouldeau stew. Just how it is made I do not know, but it is great. A baked pouldeau is a dish that is hard to beat, and one apiece is about the right amount. A scientific cook can't cook them; it takes a person who just knows how. A canvasback is not in it with the humble pouldeau, if the right person handles them. What is it like? Ah! The English language was not built to describe French and Indian cookery, so I cannot tell you, but would like to show you.

THE PENSACOLA CHICKEN.—There is the turtle and the gopher, not the Western squirrel, but the dry-land terrapin, or as we call it, the Pensacola chicken, about 15 to 18 inches long and 10 to 12 wide, about the size of a small turtle, and cooked the same way. He brings back childhood's days, and my old Spanish-Indian nurse and cook, Maria Diaz, a typical Indian, and a cook who could not be beaten. As a small boy, if real good, she allowed me to kill and clean the turtle or gopher for her. If I was bad, she did it herself, or let my brother do it. I will tell you about it. You laid the gopher on his back and got a coal of fire and set it where his diamond shirt-stud would be if he was in full dress. He sticks out his head to see if the house is afire, when you jab him in the neck with a kitchen fork, and cut off his head with a big knife or a hatchet. I never heard one say it hurt, so it must not. You now stand him on end and take a hatchet and chop the bottom shell loose from the top one, all around; when this is done use a sharp knife and cut the bottom shell loose from the flesh and clean off any good pieces of meat still sticking to it. The front and back legs are then twisted loose, cut apart and skinned. The body is cleaned just like a chicken is, and if at the right season, you may find some eggs, and they are a prize. After all the meat is well washed, you can have either a turtle stew or a turtle gumbo. They are stewed much like chicken, but are seasoned with lemon, allspice, pepper and a little onion, and cooked until the meat will fall off the bones, and served with a lot of gravy. If it was not for bad manners you would eat a whole one. For gumbo, you make a kind of soup with the turtle, and the eggs are a big addition to either the gumbo or stew; season it highly, put in some lemon, and cook thoroughly, and you have something that will stick both to your ribs and memory. Yes, even the smell of it will tempt a miser to part with his coin. You can't get it in a restaurant, and a cook book cannot show you how. The art is handed down from mother to daughter, and if any of you young men are hunting a daughter get one that has a prepotency for making turtle stew or gumbo, for a poor cook can't. You can buy gophers by the half dozen, and keep them in a box and feed on grass and vegetables so as to have them on hand and fat when wanted. They live in burrows in the ground, and are snared in pits, or with a noose in a string.

CRAWFISH.—The next dish along the line is the crayfish or crawfish. They have never tasted as good to me as they did when a bare-footed rascal, catching them out of ditches and mud-holes, and cooking in any rusty can or bucket at hand, over a smoky fire in an old field; yet they are a tempting dish when boiled, tails broken off and skinned, and then served in a salad or gumbo or bisque, and one memory of them that seems impossible to shake off is of an obscure little French restaurant in New Orleans, where they served in a bisque, made of the heads cleaned and stuffed with the chopped meat from the tails, and seasoned, then cooked in a broth. I ate two plates, and but for the looks of it, would have had more. This with a little smothered lamb, dessert and coffee was the dinner. There is a flavor to the crayfish different from shrimp, lobster or crab, and it seems to have a kind of winning way with the palate.

ORANGE-FLOWER PRALINE.—After all these good things, I really feel the need of a dessert, a little square of orange-flower praline. The praline is made of the petals of orange-flowers stirred in granulated sugar cooked to the point where it turns back to sugar when stirred, and is esteemed as not only a delicacy, but a necessity in the old Creole families, and if Huyler or any of those big candy-makers could get it, they would throw three fits and a spasm for joy; they turn out nothing to touch it. It beats a wedding, for you have orange blossoms for life in it. M. A. PARKER.

Tuberous Begonias for the Home.

There are few classes of plants that have the great variety of form, coloring and habit of growth that the Begonias have. There are the luxuriant Rex varieties with their wonderful beauty of shape in the leaf, with their lustrous blendings of jade and silver, agate, bronze and gold. There are the fibrous rooted, or more common but still variedly beautiful sorts, easily reproduced, as are the Rex varieties, by cuttings of stalk or leaf, which obligingly throw out roots when placed in water or damp sand.

Many people have a great admiration for the tuberous-rooted Begonias, and their kin, the half-tuberous, or hybrid forms, with their dainty, vine-like foliage and their surmounting masses of waxen, ruby-tinted flowers. Unfortunately a large proportion of their admirers consider that the two latter classes thrive only with greenhouse culture, and thus miss one of the finest plants the amateur may enjoy.

Begonias, tuberous-rooted ones, will thrive most satisfyingly in the home. To be sure, they will not flourish with all sorts of conditions and discouragements, as will the geranium. But given the soil that they like, and plenty of moisture, they will grow amazingly and blossom profusely. Their needs are not at all difficult to supply. To begin with, get a good-sized root or tuber. They range in price from eight cents to 15 cents each, varying with the size, variety and the firm that sells them. The shades of color are particularly beautiful, pale yellow, deep orange, pure white, salmon pink, rose pink, deep red, and the flowers are both single and double. The latter look like huge waxen roses, but do not bloom quite so freely as the single varieties. The latter now have newer forms that are fringed, half doubled, and fluted, with shaded colorings that are simply gorgeous in effect when in bloom. They will continue to send up new flower clusters from the axil of each new leaf, as the plant grows, thus prolonging the blooming season sometimes for three months.

By potting the tubers in February, March or April they may be made to furnish a wealth of decoration through the Spring and Summer months, or by keeping them dormant until in May or June you can have them for Fall and early Winter. It is a good plan to pot a couple at a time and bring them on in a succession from Spring until early Winter.

They should be planted in rather small, shallow pots, in soil composed of half leaf mold, and nearly half a rich dark loam, with a little sand. The soil should be sifted once or twice thoroughly, to make it fine, soft and light. No rotted manure need be added, but when growth is well begun, which may be from 10 days to two weeks, liquid manure of nearly any sort, well diluted, will make them respond beautifully if applied once or twice a week. Be careful that you do not set the tubers out bottom side up. The slightly hollowed or concave side is the top. They should be placed only deep enough so the soil will not quite cover their tops, with the tuber in a slight depression in the center of the pot, so that it may absorb the water better.

The temperature of any comfortable living-room is well adapted to their needs. They remind us of the needs of our own lungs, and our general health, when they sicken because of too dry an atmosphere, so often found in coal-heated homes. They should never be allowed to become perfectly dry. Frequent shower-baths are their delight, and the keeping of pans of water on our radiators or stoves insures an atmosphere suited to them. The usual dry atmosphere in homes heated by coal fires causes a dryness, unless careful attention is given to the moisture question, that is injurious to human breathing organs and general tempers, to say nothing of the furniture. So the keeping of the Begonias in a state of health will be beneficial to all concerned. Unless we wish the plants to rest from blooming, we should never let them get real dry in the pots.

Those I have in my collection were photographed when the first blooms opened, and continued for many weeks after, increasing in size and beauty. The flowers, many of them, measured four to five inches across, and were so heavy they could hardly hold up their faces. The only poor luck I ever had with them, and I have raised them successfully several seasons, was with a particularly handsome specimen that I placed in a cold hall window. Result, every flower was dropped. But in general, if a room is comfortable to sit in it will suit the plants as to temperature. A thing that will be new to many flower lovers is that a tuber may be used year after year, if managed rightly, and made to increase in size to a remarkable extent. I used to think that a root could be used but one or two seasons successfully. After each blooming period I dried off the tuber, removed it from the pot, wrapped it in paper and stored it safely away from frost for the Winter. Managed this way they won't increase in size, and are soon worn out. But I know of a tuberous rooted Begonia that is 20 years old, and of a mammoth size. Its owner's custom has been to let it bloom as long as it will, with plenty of liquid food and good care. Then she sets it away on the top shelf of her cupboard, when only partly dried out. She sprinkles the soil occasionally during the Winter, so that it does not become perfectly dry. In March she removes the loose soil from around the tuber, without disturbing the latter, replacing it with some as described. Kept moist in a sunny window it soon puts out new growth, and is a wonder to all beholders. These Begonias do not require sunshine all day; in fact, they are better off without the direct rays during the heat of the day. The same general treatment will suffice for the new hybrid forms, chief of which in beauty and ease of culture is the wonderful Gloire de Lorraine, with its wealth of dawn-flushed, waxen flowers, so abundantly produced as almost to hide the delicate foliage. A small 10-cent plant of this kind will yield generous blossoms if treated as described, and will develop into a large plant, with intermittent seasons of rest and recuperation after periods of growth and exhaustive bloom.

M. G. F.

TUBEROUS BEGONIAS, SHOWING HABIT OF BLOOM.

WELL-GROWN TUBEROUS BEGONIA.

PLANTING THREE KINDS OF PEAS TOGETHER.

Three-storied Pea Vines.

A succession of early, second early and late peas from one planting in the same row is a most economical and satisfactory method for the home garden. In this way an unsightly row of spent early pea vines, a harbor for weeds, is entirely done away with, and in short-season climates like ours, Western Maine, we cannot raise successfully two crops on the same ground during the season.

I plant my pears on well-cultivated and fertilized land that is retentive of moisture. The rows to be planted are furrowed wide and several inches deep with a liberal supply of phosphate scattered the entire length, covering it well with earth, so that the seed will not come in contact with the fertilizer. Stout stakes are driven through the middle of each row from six to eight feet apart; on these poultry netting three to four feet wide is stretched about six inches from the ground. By this method seed can be planted on each side of the netting, thus giving an equal stand on both sides of the wire. I use the following proportion for planting: One quart of Nott's Excelsior to one pint each of Gregory's Excelsior and Dwarf Champion. As soon as the young plants have broken ground the earth is drawn around them, thus producing vigorous stocky plants able to be self-supporting until they reach the netting. Gregory's Excelsior being a taller pea than the Nott's Excelsior, does not crowd or reduce the crop of the latter in the least, and the last pod can be picked by the time the Gregory's Excelsior is on, while the Dwarf Champion, having a branching habit, occupies the space left by the declining earlier varieties.

From three rows of equal length, one planted with the three varieties mixed, one with Gregory's Excelsior, and the third with Dwarf Champion, the one planted with the mixed varieties yielded twice as much as either of the two rows.

By careful selection of my Nott's Excelsior seed I have nearly doubled the size of the pods from those first grown; in fact our grocer could scarcely believe that they were not peas of a standard variety. I have excluded all the second early peas from my garden except Gregory's Excelsior, as it is as early and much more prolific than the tall, loose-growing Gradus, Thomas Laxton and Early Morn.

The Everbearing and Champion of England I plant in the old-fashioned country way in the potato patch, eight to nine peas in every other hill in two rows, skipping every third row, the potato stalks giving sufficient support for the trailing vines without any apparent injury to the potato crop.

Maine. MYRA D. SCALES.

TIMID YOUTH: "What do I have to pay for a marriage license?" Facetious Clerk: "Well, you get it on the installment plan." Timid Youth: "How's that?" Facetious Clerk: "Ten shillings down and most of your salary each week for the rest of your life."—Tit-Bits.

JOHNNY, who is the son of a commuter gardener, knows the vegetables in the garden in the only true way. Johnny's father thought it a sign of extreme precocity that a four-year-old should tell a potato from a tomato. Just to show his neighbor he ordered Johnny to fetch a potato from the garden. Johnny did it. "How do you tell a potato from a tomato?" asked the neighbor. "A potato has black bugs," Johnny answered, "and a tomato has green."—N. Y. Evening Post.

Made-over Handbags.

There is no accessory that wears out sooner than a handbag, and I am sure there is hardly a woman who cannot find at least one such frame among her belongings. Although the bag is worn out you have disliked to throw the handsome frame away. Now is the time to make use of it. No matter what it is, silver, gilt or leather, bring it out and utilize it for one of the useful and smart little fabric bags that are to be all the rage this Spring. Two of these are pictured, and they are simple enough to copy. Indeed, the clever woman can originate still other and more attractive designs to suit her materials and individual requirements.

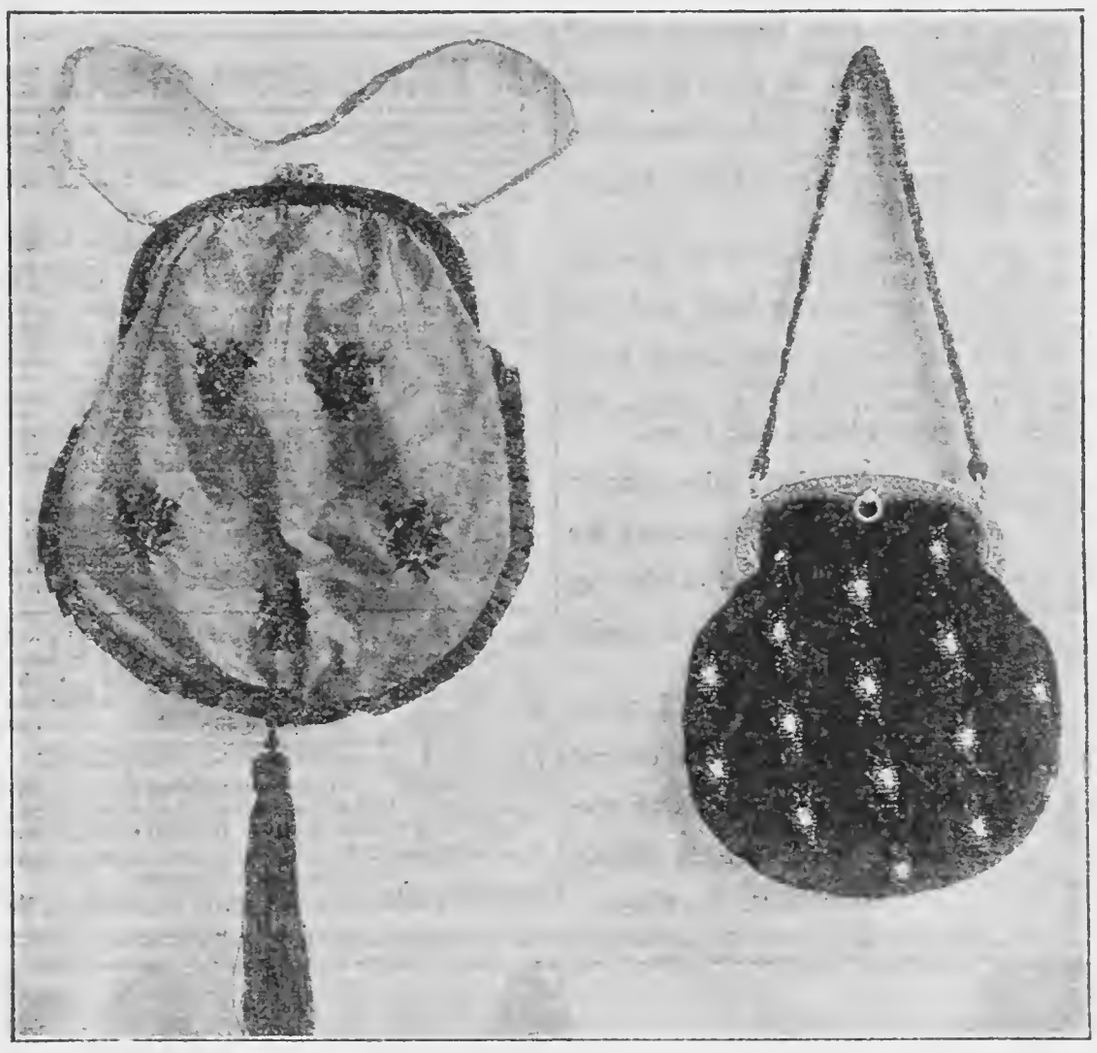
For the first bag, the scrap-bag yielded a piece of heavy pale mauve silk—a left-over from a blouse. Two eight by 10-inch pieces were folded together and the four corners rounded. One section was placed in an embroidery hoop and five clusters of flowers outlined with a pencil,—roses, forget-me-nots, violets, or any small blossom may be used. These were embroidered with dark mauve chenille, simply outlining and using lazy-daisy stitch. The effect was of flowers that could be picked. A side plaiting of inch-wide black satin ribbon was then basted around the embroidered section to the place where it began to curve for the mounting. The other section was basted to it, and the two sections sewed at one stitching. A lining of mauve silk cut the exact size of the outer sections was then fitted, it having already been stitched separately from the outside pieces. When the lining was slipped into the bag proper, it was secured at the top by turning in both the bag and lining and overcasting the two, ready to attach to the mounting. The latter, by the way, had already been freshened by covering with black satin to match the plaiting around the bag.

The bag was first secured to the mounting at the corners. The center of the fabric was then attached to the center of the mounting. It was an easy matter to blind-stitch the remaining portion of the bag to the mounting from the inside, using black button-hole twist. An inch strip of the mauve silk, interlined with buckram, was stitched for a strap to carry the bag by. It was secured to the mounting by slipping the ends through the little rings, loop-fashion, sewing firmly in place with mauve silk thread to match. A black silk tassel with a bit of silk cord garniture was sewed to the embroidered side of the bag, giving a jaunty finish.

A rose velour bag is pictured in No. 2. The girl happened to have an old silver mounting she had been saving, for mony years. When she saw an imported novelty bag in a city shop that was marked at a price that staggered her, she decided to copy the accessory and utilize the antique mounting. A piece of the rose velour from an old portiere was folded double, and rounded at the lower corners. At the upper section, the mounting was placed on it, and shaped accordingly. The velour was then seamed, and lined with a piece of the brocaded silk from the portiere also, which was left over from the loose coat fronts, recently cut away. But before lining, the velvet was placed on a tiny embroidery hoop, and beaded in a floral design, using black and pale rose beads for the purpose. It was the simplest thing imaginable to outline the designs with a lead pencil, merely dotting where a bead should be sewed. The bag was attached to the silver mounting exactly like the mauve silk one, with the exception that there were apertures in the mounting through which the needle could be thrust in securing the fabric. A black silk cord was twisted twice, and used for a handle.

Either of these bags may be varied to suit the materials at hand. If there is neither time or inclination to embroider or bead a bag, there are lovely tapestries already "embroidered," and velvets with flowers in the most realistic designs. It is really not so much a question of "lack of time" as taking advantage of spare moments. Ten cents worth of embroidery silk or beads will be the maximum expenditure, unless a tassel or bit of cord is required. Personally, I think nothing could be handsomer than a black velvet bag with a little "seed" bead design of Crimson Rambler roses, a green bead leaf showing now and then.

LOUISE E. DEW.



UTILIZING THE OLD MOUNTINGS.

No. 1. Home-made bag of mauve silk, combined with black satin plaiting, and mounting.

No. 2. Rose velour bag with flowers beaded.

Hospital Stories.

Grewsome things sometimes happen at the hospitals and sometimes very funny ones. Two men were in a hospital as patients, their names the same. One had a fine family grieving over his illness, the other seemed alone. The lone one died. The name was looked up, getting the address of the family man and word sent. A sobbing wife soon arrived, almost helpless from shock and grief, accompanied by a couple of friends to take care of what was left of the loved one. Imagine their feelings when they found the dead man they were dreading to see a burly negro of the blackest type!

An Italian was ill and went to a hospital. After the usual bath, clean garments and examination, he was resting comfortably waiting the effects of the medicine administered. Another Italian, an anxious friend, came next day, who could not speak English. He gesticulated wildly and his face denoted great suffering, as he tried to make himself understood. Hurried attendants, as his trouble could not be learned, grasped him and by main force, against struggles and resistance gave him a good bath and put him in a clean bed to await examination. Being put in the same ward as the first man, who could speak English, it was soon learned that he was not ill but had called to see his friend, and so received an unexpected and unwelcome bath.

In a large city at one of the hospitals where there is much dispensary charity work done, on Christmas Day over one hundred little poor children were invited. Seated by tables all around the room they enjoyed their beautiful tree. There was a present for each, and a stocking full of toys and goodies, and in the toe of each stocking a silver quarter. The quarter was a great surprise, many never having had one before. One little fellow said: "It's a real nickel," another "Ain't it a fake?"

CLARA T. SISSON.

"Better than leather For all kinds of weather"

Cut Your Shoe Cost and Have Real Foot Comfort

The cost of leather is jumping higher. More leather is used every day. The automobile makers alone take enough to put the price up. That is why leather shoes cost more than ever before.

Here are work shoes far better than any of leather. They are right in fit—absolutely waterproof—comfortable—and cost less than leather work shoes, because they always outlast them. Buy a pair today. Ask for them by this name—**Hub-Mark Bootees.** They mean money saved—no rheumatism, no corns, no bunions, no callouses—in short, real foot comfort.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys, and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are square dealers.

Deafness and Cheerfulness.

It is said that there are about one million persons in the country who are more or less deaf, the condition running from a slight loss of hearing to total deafness. From correspondence we judge that a number of thousands of our own subscribers are in that condition. One of the best books for these unfortunate people is "Deafness and Cheerfulness," by Dr. A. W. Jackson. This little book contains some of the soundest philosophy to be found in the English language, and is a fine example of first-class English. The author is a deaf man, so he knows his subject, and also what it means to live shut off in the silence. If possible, every person who is hard of hearing should read and study this little book, and it might also be well for the associates of the deaf man to read the book, for it will contain many lessons and admonitions for them. For some years we have made a practice of sending this book here and there as we came to know deaf people, in order that they might read it, and in each case we have asked them to tell us just what they thought about the philosophy which is taught by the author. Now we want to give with this a letter from such a man as a fair example of what cheerfulness in an affliction may mean. This is from an elderly man who might easily have been made sour and discontented by his affliction. There is a lesson for all of us in the cheerful spirit he shows in his criticism of the book.

Dr. Jackson has written a very readable book upon an unique and very unpromising theme. My criticisms are not so much with what the author has said as with what he has not said. A chapter might well have been added to ventilate the "Advantages of Deafness as a promoter of Cheerfulness." Like every other subject, there are two sides to be taken under consideration. The compensations are worthy of note, because they contribute largely to cheerfulness.

1. A partial or a total loss of hearing tends to quicken the power of sight, just as the blind are compensated by the sensitiveness of touch. Cut off from hearing, dependence is placed more upon sight; spectacles may still be necessary, but one has greater powers of observation. The deaf man sees everything. If he cannot as fully interpret nature and society as the man with hearing, yet he comprehends and appropriates both to a greater extent than some suppose. The music of nature is silent, but its poetry is vocal.

2. Deliverance from confusion, disorder and nerve-racking furies of both nature and society when at their worst. Many a man and woman whose sensitive nerves are daily tortured with the babel of harsh sounds would give much for a few hours or days of deliverance from the ever-present irritation; a time of calm quiet would truly be a rest sublime; such a rest would bring peace and when peace abides cheerfulness must reign.

3. Freedom from the infliction of unwelcome words. Very much which greets the normal ear would better not fall upon the auditory nerve. Our cheerfulness would be more constant and full if a considerable portion of talk which we are compelled to hear should lose itself in silence ere it disturbed our serenity.

4. Second nature. If deafness comes on gradually, it produces a readjustment of our mental processes; in a word it becomes second nature—as the fishes in a dark cave are sightless, yet disport themselves in their native element with as much apparent happiness as their neighbors outside in the light with full powers of sight. I do not say that in the case of the deaf these and other offsets, I might mention, are sufficient to make up for the loss of hearing, but I do claim they go a long way in that direction.

A. G. BLOOMFIELD.

A Neighborhood Library Branch.

We have it right here in the house, so feel qualified to tell about it. This town is long and narrow, with a number of small villages in its limits. The main library is in the center, in the graded school building, open once a week, on Fridays. There are five of the branches in outlying villages where some friendly person will accommodate the books. The salary is nothing, but you make your own rules. There are 50 books here, changed every six weeks. A public school is near, so half of the books are supposed to be juvenile, and the children can come any school day for an hour after school. The grownups come when they can. Books are to be taken out for two weeks, and renewed for two weeks more, and there is a rule about fines. But what we really do, is to suit rules to circumstances. Fines are not strictly enforced, as the state of the weather, the roads, the sometime absence of the librarian and various other things must be considered.

Our humble branch is in the kitchen, on shelves made from shoe boxes. The kitchen is in an ell facing the street, and seemed the most convenient place, and most easily cleaned up in muddy weather. Father seems to think the books are for his own especial benefit. We have first

A Dependable Friend.

chance at the books when they are changed, and try to read all, so to know what to recommend. Nearly all the books are fiction, as the demand is all for this, but in course of time one may get special books wanted from the central library.

Readers vary in number, being more in number when the mills are closed or in school vacations. The people are more interesting than the books. Small boys demand the Alger books. One lad spent half an hour on his knees personally examining the 50 books to see none was an Alger, then departed with none. One small girl asked for the "Algebra" books. Many children like the most sensational, one honest girl saying of a "Motor Girl's" volume: "My sister said she never read such a lovely book!" But they all read all the books, and one small boy from a large family next door shows a very true taste, but wants large print. He would like Kipling's Jungle Book next.

One young man thinks he likes problem novels or something instructive. He was very enthusiastic recently over Sheldon's "A Builder of Ships," and has recently had "The Parish of the Pines" and "A Year in a Coal Mine." He gets books for his family and a neighbor shut in by the care of a childish old mother. There is a bright young school girl who comes in the evening with a companion and takes several books, usually charged up a month ahead. A number of people read these. A tired young school teacher wants something bright and short in good print; this is charged up some time ahead, we do the choosing. Then there is a friendly neighbor who takes half a dozen books in as many names for the benefit of an incurable invalid on an outlying farm. These generally go for a month and are read by the neighborhood.

The circulation of books, including those read by the family of three inveterate readers, is about one hundred a month. Sister, who really took in the books, when no one else would, is too delicate to do church or club work, yet wanted to do her little to help. This seems to be the thing she can do. There is seldom anything that bothers her; she doesn't mind having the books here at all. Perhaps someone else, reading this, many find a similar opportunity.

Sister, following the advice of an experienced acquaintance, finds it most convenient to allow grown-ups to come in when they wish. But she does not try to stay in if she especially wishes to go out, usually putting a card on the outside door marked: "Out, Leave Books to be Returned." But she found it best to make a rule that children should only come for an hour after school.

One has to keep a record of the books and Sister calls this her easiest way. She uses an ordinary wide five-cent composition book.

Name	Number	Time Due
John Jones	441	Jan. 15
Paul Knight	40	Jan. 15
Susie Robinson ..	67B	Jan. 16

The line is crossed off when the book is returned, and a new entry made. This is only possible because there are seldom more than 20 books out at one time. For a week while Sister was away, and for many more weeks when she was out and father was in, the branch nearly ran itself. People came in, crossed off the entry under their names, chose a new book, recorded it and went out. The books are sorted into several different piles under general headings of Grown-ups, Boys, Girls and Little Children's. The children like it, and Sister finds it much easier.

Massachusetts. EDNA S. KNAPP.

Where Brains Are Needed.

"I claim it takes more brains to farm,"
said Ebenezer Brown,
"That what it does to git ahead and
make a splash in town;
Why, I know six or seven chaps from
this here neighborhood
Who went away to cities, where they're
busy makin' good.

"You take Chicago and New York—size
up the big men there—
The lawyer, doctor, merchant and the
multimillionaire—
You'll find they've all been farmer boys,
or lived in towns, at least,
Where they could have a chance to
learn the ways of bird and beast.

"Now take these city chaps who come to
cultivate the land—
I don't mean millionaires who farm for
fun, you understand—
But take the common city folks who try
to farm, and say!
It's pitiful the way they try to make
their farmin' pay.

"I've saw a dozen of 'em fail; I never
seen one yet
Who managed to be prominent or not
get into debt;
And so I claim a man may make an awful
splash in town
And not have brains enough to farm,"
said Ebenezer Brown.

—S. E. Kiser.

Home Problems

[Under this heading we discuss actual home problems of real people. The questions are all genuine and they relate to real troubles. Some of them can be helped by kindly advice or discussion.]

Trade for a Boy.

Is it advisable for a young man to learn telegraphy for a trade, or would some other trade be preferable? It should be understood the young man has no special desire for a certain one. Just wants to learn some trade. It is said that telegraphy would not be desirable because it is expected the railroads will do away with telegraph in near future and use 'phone, thereby putting thousands of telegraph operators out of work.
Missouri. C. P.

This trade does not offer great inducements. We should not care to have one of our own boys enter it. It is quite likely that the telephone and an improved wireless system will finally be substituted for much of the telegraph work, and the outlook now is for government control of these utilities. We think there are greater opportunities in one of the mechanical trades.

Two Girls and $400.

I have a problem on which I would like advice from some of the readers. Maybe I can get ideas if not help. I have $400 saved up, and two girls. I wish to come East and get some small place, where I can raise poultry and keep a few cows. Our fares would have to come out of my capital. Can one get a place by small payments? Have some of the women readers had any experience getting homes that way? I would prefer to rent with privilege of buying. I was born and raised on a farm, and have worked outside at almost all kinds of men's work. I am ignorant of fruit, except small fruit; have never seen an apple tree. I have always had good success raising chickens, turkeys and geese. I am not particular about any place, but I cannot afford to look around either. I don't want to be too far from school.
Minnesota. MRS. L. W.

This is not an exceptional case. We have hundreds of cases where women left alone in this way, with a few hundred dollars, wish to start a home in the country. The great danger in such cases is that these women will fall into the hands of land sharks or swindlers who will obtain their money and then take the home away from them. We know where this very thing has been done. This woman presents one side of a hard problem. The other side, which fits into it, is presented by the man or woman with a farm, yet lacking the needed little capital or the housekeeper to conduct the business properly. THE R. N.-Y. tries to fit the two sides together. "Two girls and $400!" Where can a home be found for such a capital?

Developing a Direct Trade.

Where can I find a good market for pure maple syrup? We make fine syrup, weight 11 pounds to the gallon, or 11¾ pounds with can. We have been making only about three or four years, and we do not know where there is a good market. It only sells for 75 and 80 cents per gallon here, unless we peddle it, and we do not have time for that. We should get $1 per gallon packed and delivered at the depot, to make it pay. We would tap a thousand or 1,500 trees if we could get the market. Of course we sell a little here for the dollar and have a good customer in Florida. Can you suggest where we can get the market? I have tried until I am discouraged.
Pennsylvania. T. E. B.

Our chief reason for starting the department of "Subscribers' Exchange was to help find just such markets. There are thousands of our readers who would like to buy fine syrup. You do not know them and they do not know you—therefore you cannot find a good market, and they do not know where you live. The introduction would come through a few lines in this "Exchange." This was started far more to help in such introductions than to make any profit. Our best advice is to try it.

A Clergyman and Tramp Hens.

A clergyman has a small farm on which he grows small fruits, corn and potatoes. Just across the way his neighbor, a vociferous professing Christian keeps unrestrained a large flock of poultry to the constant annoyance and financial loss of the long-suffering preacher. This neighbor's attention has been repeatedly called to this nuisance, but without avail. What can be done? A.
Wayne Co., N. Y.

We sympathize with this clergyman. Those wandering hens are enough to scratch the pulpit off the platform and change the course of many a sermon. The ungodly might take a shotgun, shoot a dozen of the hens and throw them on to the neighbor's premises. If he were large enough, he might challenge the hen man to come out into the middle of the road and settle it. He might bring suit before the local justice of the peace, and find that he could not prove damages. The wives of the two parties might each stand at the fence, tell each other a few truths, and then never speak again as they pass by. All these things, and many more like them, have resulted from the visits of wandering hens, but in the case of this clergyman they are not to be thought of. Judging from experience, the best plan would be to make those hens work out and pay for their own damage. Put up a good house in a convenient place, with a good-sized yard around it. Leave the door of the yard open and scatter some corn inside. The hens will do the rest. They will go in after the corn. When a good bunch of them are safely inside, no one could be arrested who went out and shut the door and kept it shut. The hens will proceed to lay in their new quarters, and the owner of the hens cannot come and get them, without rendering himself liable for trespassing. Thus he will either find it necessary to make the clergyman a present of the hens, or pay for the damage they have done, and keep them at home. We could give a dozen methods of ending the trouble, which would involve a great deal of hot language, but "A soft answer turneth away wrath," and nothing could be softer than the "snap" of making this neighbor's hens contribute to your own egg basket.

WOMAN'S WORK IN THE PEACH ORCHARD.

A One-armed Farmer's Plan.

I am a young farmer. Two years ago I had the misfortune to lose my right arm. I am now trying to "farm it"; I have a farm of 115 acres, keep a team of big draft horses and a general purpose team. I intend to breed all four horses. Would it pay me to keep cows and a hired man, or sell cows and buy sheep and do my work alone? I have good pasture for sheep and goats. F. C.

During the past few months we have had a dozen problems like this one submitted to us. Several men who have lost an arm, at least three who have lost a leg, several who are totally deaf, others who are nearly blind, women who are lame or feeble—all have come asking how they can make a living on a farm. It is wonderful how the beaten and the afflicted look to the country for help and a new chance. It will do us all good to think out, if we can, a sensible plan for a crippled or afflicted farmer. We have several times referred to the farmer on Long Island with only one leg. This man, by using machinery and studying farm economy, has been able to make a great success. He has probably done better than he would, had he not lost his leg. The physical affliction has forced him to study his work as he could not otherwise have done. We advise this one-armed man to give up dairying. We know of a case where a man with a dairy had his arm crushed. He bought a milking machine and kept on, but a man should have two hands to *start* in the dairy business. There is surely a future with milch goats, breeding sheep and selling high-grade heifers. What would *you* do? We mean that there shall be one place at least where the troubled and afflicted may receive honest and sensible advice. That means experience!

When you write advertisers mention The Rural New-Yorker and you'll get a quick reply and a "square deal." See guarantee editorial page. : : : : : :

The Old Wooden Watering Trough Has Gone

The mossy, rotten trough of the past has disappeared and no farmer regrets its going. It always leaked; the ground around it was an ugly mud hole, trampled by horses feet.

Concrete Has Replaced It

The concrete watering trough is a vast improvement over old time troughs. It is well built, substantial, attractive, improves the appearance of the whole barnyard. It banishes mud holes, is water tight and time proof. If you are building a concrete watering trough or any other concrete structure, use

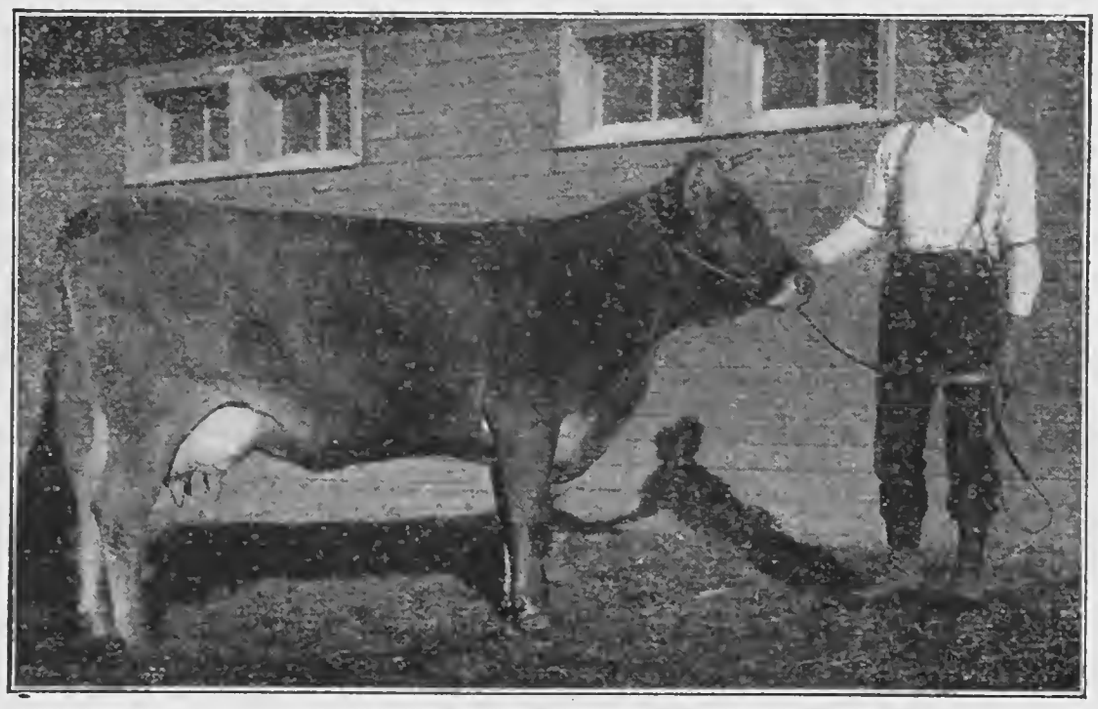
THE BROWN SWISS COW.

On page 366, I note an inquiry in regard to whether the Brown Swiss cattle are good milk producers or not, and since I have had charge of a registered herd of Brown Swiss for five years, I feel somewhat acquainted with them and can say that after having had experience with registered Guernseys, Jerseys and grades of all breeds, I still maintain that the Brown Swiss cow produces a large amount of milk at a minimum cost. In my opinion they are one of the breeds which is going to be very popular in the near future. The principle difficulty is that they are not known. People who are fortunate enough to get them soon find their value and keep them. They are large rugged



A GOOD SPECIMEN OF BROWN SWISS COW.

cows and will consume a large amount of roughage and thrive where many of the tender breeds would starve. To prove my argument I might cite two or three records made in the herd I had charge of. One three-year-old heifer made a record of 9,172 pounds milk testing 4% butterfat; another 8,384 pounds. The second milking year of the above she produced 10,238 pounds and started on the third year with an average of 40 pounds per day for 96 days. I have spoken of only her, but the entire herd were close to the above in milking qualities.

There is a large milk producer near here who owns a Brown Swiss cow that produced 15,018 pounds milk last year and they have cows of nearly all the popular breeds; yet he maintains he can produce milk cheaper from the Swiss than from any of the other breeds, because they will thrive on feed that other cows will not touch and produce a large flow of milk. The above milk producer milks somewhere near 100 cows and is in a position to know the value of cows as milk producers. I was calling on another neighbor a few days ago who has 25 head of very high-grade cows, some producing 15,000 to 18,000 pounds per year, and in the herd was one Brown Swiss cow. In the conversation I learned that the neighbor had the chance to buy two more Swiss cows with this one but did not. Why? Because he did not know how good they were! Now he says he made a big mistake, that he did not purchase all three. I know of another neighbor who has been a large milk producer with grade cows from all the milking breeds, and by chance he bought two high-grade Swiss cows. What is his opinion? The best cows he ever owned in 14 years of experience. In my opinion the Brown Swiss, as an all round cow, takes second place to no other.

Massachusetts. A. A. B.

BUYING PUREBRED STOCK.

I have been a very much interested reader of the purebred live stock discussion, and would like to give my experience in that direction. As the demand here is for whole milk, for the local and Boston trade, I naturally thought to try Holsteins. I enclose two letters I received from breeders (both large breeders, of means). One will sell three heifers at $50 each, but note the sentence—"I should want to sell all three together." No one can find fault with his prices, but when he adds that last sentence, he puts his stock out of reach of the smaller breeder, or beginner.

In the other letter, you will see he puts his stock entirely out of reach of the ordinary farmer. He sells no heifers till tested. I do not know what he does with those cows which fall short of the requirements, but surely no one will care to purchase at any price and those cows which make larger returns, are certainly out of the reach of the common run of farmers, if for sale at all, yet this very breeder attends all the breeders' meetings, and talks long and loud on the advantages of registered stock.

I know well that every man has perfect right to do as he pleases with his live stock, or any other property he may have, but the point I want to make is this: How can the common run of farmers secure any purebred stock under these conditions? I do not believe any farmer of the present time will contend that purebred stock is not ahead of any scrubs, but until the big breeders act differently, it looks as though considerable scrub stock will, of necessity, be kept. I might add, that while I have had to give up my dream of purebreds, for the time being, I am not out of the race, and expect sometime to find a man who will sell me some of his purebreds.

Massachusetts. M. K.

Molassine Meal
MADE IN ENGLAND

Unique—Distinctive—Superior

It is made by a *specially prepared process* which produces a feed absolutely unlike anything else in the world.

For 20 years it has watched imitators come and go, but today Molassine Meal holds the field as the *one and only feed* of its kind that *will produce the results* claimed.

It is today being fed and recommended by Agricultural College graduates, who having carefully educated themselves in the theory of farm problems, now find Molassine Meal in every day practical farm life produces most satisfactory results.

Insist on having Molassine Meal, as nothing else will take its place.

If your regular grain dealer will not supply you, write us—in fact, write us anyway, for we are quite sure we can improve your feeding ration.

BOARDER COWS.

There is a great deal more to this problem of finding out which cows are not paying their way than would appear on the surface. Weighing the milk and testing it for butterfat are important requirements, but there are other causes for low production than breed or individuality and a great many things must be taken into account before a cow can be placed in the discard as far as dairy qualities are concerned. Cow-testing associations that hire a specialist succeed better in weeding out the low producers than do many individual dairymen, because the specialist takes into account the surrounding conditions, etc., feeding and care, in forming his estimate of a cow's worth. And even after he has tabulated the results of his investigations the owner of the cow may conclude that owing to an unusually favorable market for his dairy products he can make a cow pay that tests low in butterfat

Feed and care affect milk flow. From the moment a calf is dropped a careful supervision of the feeding and care of its mother is necessary if the milk flow is to be kept up to normal during the entire lactation period. Experience shows that if one lets the milk flow decrease for even 24 hours it is next to impossible to raise it to its former yield unless more grain is fed than was necessary before the drop in production. Additional grain eats into the profits. Let a cold snap come or the cow be made to drink water that is too cold, and she will reduce her flow of milk in consequence. Therefore should not the cow be tested under the most favorable circumstances when she first freshens, and after being fed and cared for carefully so that her milk flow is kept as near the maximum as possible, be tested near the close of her lactation period if a true record of her worth is to be ascertained? It would be hard to tell the value of a cow's yearly production if all the conditions under which she works as well as the work she does are not carefully taken into the calculation. Many a good cow is condemned because of a low yield of milk when the chances are that in the hands of another dairyman under a different environment she would be a profit maker.

A standard is hard to find. Any particular standard by which a cow's production can be measured depends a great deal on circumstances. The dairyman who ships cream or makes butter may or may not want cows yielding high in butterfat, depending upon how he values the skim-milk for feeding purposes. Usually the standard butter cow is the one giving 6,000 pounds of milk a year, testing 5% and yielding 300 pounds of butterfat. However, many farmers and dairymen are content with cows testing below 4% and yielding less than 200 pounds of butterfat if they produce calves that will grow into fair beef animals and consume the skim-milk their mother yields at a profit. Also the milk dairyman with a market for milk testing as low as 3½% can afford to keep cows that the cream shipper would class as unprofitable. Likewise the whole milk dairyman would scarcely keep cows with low milk yields and high tests. The butterfat would not be of value to him. It takes an immense amount of feed and excellent care to induce a good cow to produce 6,000 pounds of milk in a year, so let the statisticians who delight in counting the number of boarder cows there are in existence first count the good cows that are not being fed properly or classified properly and reconstruct their figures accordingly.

H. B. COBB.

Continue the Dairy Business.

"The man who goes out of the dairy business to-day is going to make a serious mistake," was the remark of an official of a large city milk concern. "The demand for milk is increasing much more rapidly than the possible supply. The prices are being revised upward. Better milk is being called for, and the farmer who produces a clean product, has a good healthy herd, and sanitary surroundings need not fear from milk inspection in the Pittsburgh territory. In fact it is going to pay the farmer better than heretofore to produce good milk. The unsanitary farmer will fall out of line, his milk will go the way of the inferior product, and he will become discouraged with prices and quit the business. This will leave a better field for the producer of quality milk, and this influence alone in building up prices is worthy of consideration.

W. J.

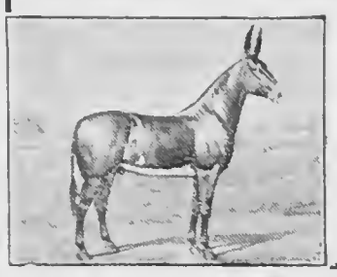
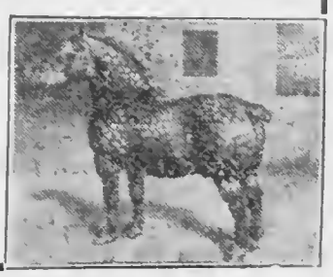
Come to me when you need stock. I will make it worth your while.





W. L. DeCLOW, Stallion and Jack Importing Farm, Cedar Rapids, Iowa

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Milk for Cow Feed.

Would it be injurious to feed warm separator milk back to a milch cow?
Milford, N. Y. A. D. B.

No. There would be no injury whatever. Such milk is good cow feed and is frequently fed on most farms. The results would be better from feeding such skimmed milk to little pigs or hens. As cow feed, however, such milk will give good results, and is not an unnatural feed as you claim.

Dairy Ration.

Will you give a balanced ration for Jersey cows in order to get the most butter? I feed early-cut well-cured mixed hay and water twice a day with the cold chill taken off. Grain available, cornmeal, cottonseed meal, oil meal, mixed feed, hominy, Ajax flakes, bran middlings, beet pulp, oatmeal and feed flour. Please give me a ration for the same cows in Summer while at grass. J. F.
Maine.

A good ration for your cows at present is cottonseed meal two parts (by weight), oil meal one part, cornmeal one part, and Ajax flakes two parts. When the cows are on pasture feed cottonseed meal three parts, cornmeal one part and bran one part. At present feed one pound of grain to 3½ or four pounds of milk. During the Summer the amount will depend on the amount of pasture. Give as much grain as will give a profitable increase in the milk production. C. L. M.

Another Dairy Ration.

Will you give me a balanced ration with these grains? I have nothing but corn fodder, and would like to have a balanced ration for my cows. Cottonseed $1.85; corn chop $1.35; oil meal $1.85; brewers' grains, dried, $1.60; gluten $1.60; bran $1.40. H. L. S.
Pennsylvania.

Mix 100 pounds of cottonseed meal, 100 pounds oil meal and 200 pounds wheat bran. Feed six to eight pounds daily, according to the amount of milk the cow gives. C. L. M.

Ration for Fattening Pigs,

Will you give me a balanced ration for pigs 10 weeks old or more? I have corn, beans and middlings, corn at 80 cents per bushel; beans $17 a ton, and middlings $28 per ton. We boil the beans in a 60-gallon iron kettle, then mix together and make into a slop. We fatten from 20 to 30 a year.
New York. G. W. W.

Equal parts corn and beans have about the nutritive ratio which gives best results for feeding pigs. Toward the end of the fattening period the proportion of corn should be increased. Your method of preparing the beans is a good one. The amount to be fed depends of course on the appetites of the pigs, and the judicious feeder will be able to tell when the pigs have sufficient nourishment and yet are not overfed. C. L. M.

Ration Without Succulents.

I am just starting in the dairy business and as I do not have any silage or roots to feed would like you to give me a balanced ration of the following: Gluten $1.50; sugarota dairy ration $1.45; brown middlings $1.40; red dog $1.60; corn, oats and barley $1.40; wheat bran $1.45; oil meal $2; corn and oats chop $1.60; Buffalo dairy ration $1.45. I have cut corn fodder and mixed hay for roughage. My cows are most of Guernsey breeding. The above named feeds are about all that can be bought in this vicinity. J. H. K.
Pennsylvania.

Mix together three parts, by weight, of gluten feed, two parts oil meal, two parts red dog flour, and three parts bran. It increases the palatability of feed to mix in two or three per cent. of fine salt, and I usually do it. It is also well to give the cows free access to salt, if convenient. Feed six to seven pounds a day to a cow giving 25 pounds of milk and more or less in proportion to milk production.
C. L. M.

Ration for Brood Sow.

Will you give me a balanced ration for brood sow before and after farrowing, made from following feeds? Cornmeal $1.55 per cwt.; bran $1.40; flour middlings $1.60; linseed meal $2. S. F. K.
New Jersey.

Before farrowing give a thin slop of three parts by weight of flour middlings, two parts wheat bran and one part oil meal. The slop may be made with water, or if milk or whey is available, so much the better. There is little danger of overfeeding, if the sow has plenty of exercise, and is supplied with charcoal, salt and ashes. For a few days before farrowing, and for two days after, feed moderately. Then give a slop made of three parts middlings, one part cornmeal and one part oil meal. If there is any tendency toward constipation add two parts bran. After a few days the feed should be increased considerably, and the sow should have all she will eat three times daily, and still have a good appetite for the next feed. C. L. M.

Balancing a Ration.

How may I make up a balanced ration out of the following: Cottonseed meal, per 100, $1.85; oil meal $1.75; molasses feed $1.25; cornmeal $1.40; bran $1.35; Timothy hay two feeds; silage one feed. E. P. V. A.
New York,

Mix three parts by weight of cottonseed meal, one of oil meal, one of cornmeal and two of bran. Feed with the silage. Feed one pound of grain per 3½ pounds of milk. C. L. M.

Molasses for Hogs.

I am starting to raise some hogs and have no milk to feed nor any tankage. What do you think about feeding molasses to hogs? What amount would you feed to pigs about six weeks old, and to a sow having newborn litter? How would you increase when pigs are getting older than six weeks? I would like to have some one answer this for me.
Pennsylvania. E. A. K.

Feeding molasses is commonly used to increase both the palatability and digestibility of the feed eaten. As hogs usually eat enough without molasses there is no reason why it should be fed to them for the purpose of increasing consumption, so for this reason molasses is not as valuable for pig feeding as it is for horses and cattle. Under some conditions, however, it is possible that molasses may increase the digestibility of the other feeding stuffs eaten sufficiently to warrant its use for pigs. C. S. G.

Local Butchers and Beef.

I have read the article on the first page of February 21. The East is not the only place where the packers have the retail butchers handcuffed. About six weeks ago a farmer near here brought a fine three-year-old dressed beef to town, to sell to a butcher. I happened to go into the market right behind the farmer and heard him say he had four quarters of beef which he would like to sell to the butcher. All the satisfaction he gave the farmer was, "We can't handle country-dressed beef," and no excuses or explanations given for choking the farmer off short. I bought one quarter of the beef and it was the best we have ever been able to buy in this town in the 19 years that we have lived here.

A month ago I took a basket of strictly fresh eggs into a grocery at Gary, Ind., and got 34 cents per dozen and at the same time they were selling them for 44 cents per dozen and these same storekeepers are making a great howl because some people who like a square deal go to mail-order houses t oget it. H.

363.1 Bushels Potatoes

From One Acre of Massachusetts Land

A. Webster Butler of Brockton, Mass., won the first southern zone prize offered by the Bowker Fertilizer Company for the largest yield of best quality potatoes grown exclusively on Stockbridge Potato Manure. His acre was a "rocky loam" producing about 2 1-2 tons of hay per acre in 1912 on manure. Rows were 36 in. apart and Green Mountains cut to two eyes were planted 14 inches apart. The piece was cultivated five times. The acre was sprayed with Pyrox.

STOCKBRIDGE POTATO MANURE

was applied 2100 lbs. broadcast and 700 lbs. in the drill. No other fertilizer or dressing of any kind was used. The entire crop weighed 21,783 lbs. or 363.1 bushels. His total score including quality points was 589 points, the highest in the southern zone.

Other Winners secured yields ranging from 311.1 bushels to 502.6 bushels in the northern zone, (Me., N. H., Vt.,) and from 183.8 bushels to 363.1 bushels in the southern zone, (Mass., R. I., Conn.)

Send us your name for complete and intructive statement concerning the results of the contest and how these great yields of potatoes were obtained. No other fertilizer than the Stockbridge Potato Manure was used.

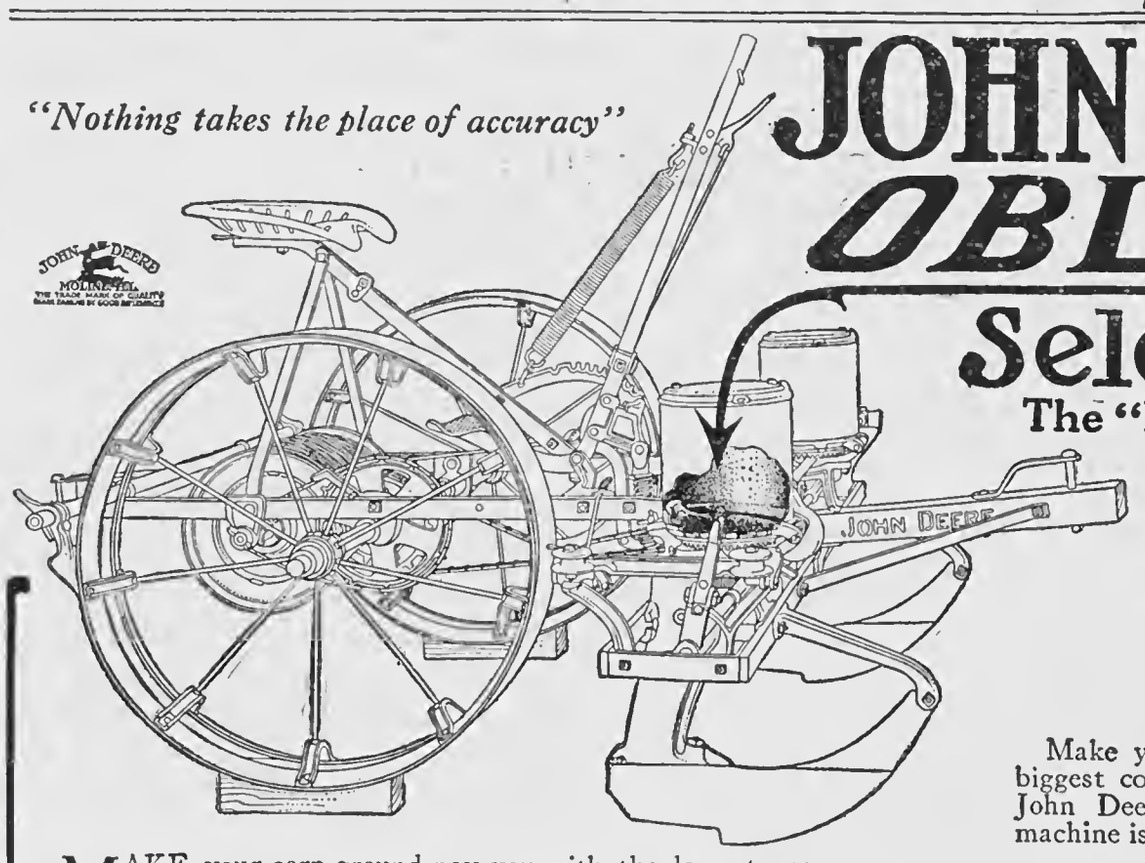
"Nothing takes the place of accuracy"



JOHN DEERE OBLIQUE Selection

The "Natural" drop

This machine maintains high accuracy even with ordinary seed. With well selected seed its dropping accuracy is practically perfect.

MAKE your corn ground pay you with the largest possible yield, by making sure that the required number of kernels is in each hill.

The seed must be there. Every "miss" means just that much thinner stand. No amount of cultivation can make up for inaccurate planting. The loss of one ear from every hundred hills costs you the price of one bushel per acre.

For years the John Deere Company has concentrated on accuracy in planting devices. The "Oblique Selection" solves the problem.

The results of its use are so profitable that many corn growers have discarded the best of previous machines. It is as far ahead of the old Edge Drop as it was ahead of the round hole plate.

Make your spring planting the start of your biggest corn crop by accurate dropping. The John Deere "Oblique Selection" will do it. The machine is a splendid investment.

Free Book Gives Valuable Corn Facts

Write us today for free booklet "More and Better Corn". It tells you why the average yield for the United States is only 25 bushels an acre, whereas better methods have produced 125, 175 and even 255 bushels per acre in places. It also describes and illustrates the John Deere "Oblique Selection" Corn Planter. The book to ask for is No. D 33

John Deere, Moline, Illinois

A Breeding Chart.

I was quite taken with the chart by Mr. Felch describing line-breeding in chickens on page 241. It could be used to demonstrate how we could drive scrubs of all kinds off the farms in a few years, by changing his figures a little, and substituting the words purebred for male and scrub for female. I don't know how he would produce one having fifteen-sixteenths, twenty-one-thirty-seconds, or twenty-seven-thirty-seconds. In crossing purebred and scrub stock, of any kind we use the terms, breeding up, and breeding down; you breed up by always using a purebred sire, you breed up or towards purebred stock, and by using a grade or scrub sire, you breed down or towards scrubs, and the removes are: one-half, three-fourths, seven-eighths, fifteen-eighteenths, thirty-one-thirty-seconds, sixty-three-sixty-fourths, which is practically purebred, but not all the herd books will admit them for registration. You could not do the live stock interests a better service than to get up such a chart and the explanation, and keep it in a conspicuous place in The R. N.-Y. I have heard for years about making two blades of grass, and two grains of corn grow, where one grew before. It is not the number of blades or grains you raise that counts, but what you do with them after you have raised them. There is many an old scrub in this State, and I expect in others, eating blades and grains that would not sell for the value of the feed they have eaten; in fact they could not be sold at all but farmers still continue to raise them.

UNCLE JIM.

Lame Turkey.

I received one tom and two hen turkeys last month, and apparently they were all right. The next day the tom appeared lame, but next day after that he seemed to be all right again. Since that time he has grown worse, and at this writing he is unable to stand at all. He lies on his breast with one leg extended out. The hens are doing well and seem to be at home in their new quarters. I wrote to the people that I purchased them from, but got no satisfaction. The birds have a run 15x35 to exercise in, but the tom does not move from his night quarters. F. J. S.

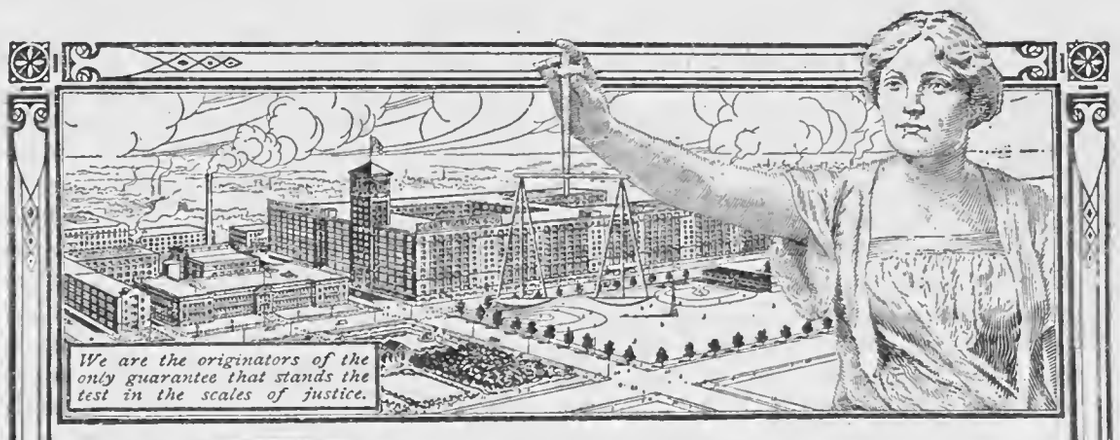
Connecticut.

If you can find no evidence of injury to this turkey's leg, it is very possible that rheumatism is the cause of the disability. I should place the tom by himself in warm dry quarters and feed him mederately upon soft, easily digested food, and if at hand would, give what skim-milk he would drink. As medicine, dissolve three grains of sodium salicylate in as much water as you can induce the turkey to take, and administer once or twice daily. M. B. D.

A Rice Incubator.—We have heard it claimed for the "natural method" of incubation that you can hatch with the hen and then eat up the incubator. The Chinese near Amoy have another scheme, as described by Consul Brissel:

"The breeder first takes a quantity of unhusked rice and roasts it, cooling it down by fanning or by allowing the wind to blow through until it is lukewarm. He then spreads a three-inch layer of the rice in a wooden tub and places about 100 eggs thereon; another layer of rice, this second and subsequent layers being but two inches in thickness, is spread over the eggs. Each tub will have six layers of rice and five layers of eggs, so that there will be 500 eggs in each tub. The rice should be heated once every 24 hours, the eggs being taken out at such times. When the eggs are again put in the rice the bottom layer is placed on top and each of the other layers one row lower down, while the eggs previously in the center of the tub are placed at the edge. The entire tub is covered with a cotton mattress. One of the great difficulties with this method is the inability to tell just when the eggs will hatch, which of course renders the smothering of the young very possible. The measure of success of the breeder depends largely upon his ability to care for the chicks at this time."

The lawyer was endeavoring to pump some free advice out of the doctor. "Which side is it best to lie on, Doc?" "The side that pays you the retainer."—Cincinnati Enquirer.



Williams Quality Harness

The steady growth of our harness store—now the largest in the country—is due only to the exceptionally *high quality* we offer, at prices asked elsewhere for *ordinary* grades.

We want you to know all about our harness store—the reasons for its success—and the values we are now enabled to offer. Turn to the harness pages of our big General Catalog—or, if you prefer, write us a postal card and we will mail our new book of harness, saddlery, blankets, fly nets, dusters, robes, trimmings, whips. This book also contains our complete line of buggies, implements, cream separators, gasoline engines, farm tools and other farm helps. If you want this new book free, simply write on a postal card "Send me your Harness Book No. 66R68"

IN THE face of an advancing leather market we still use the *genuine bark tanned* leather which has made *Williams Quality* mean the best in harness for the least money.

Our fair and square methods of manufacturing and selling create and hold in the minds of our customers the strictest confidence. Hundreds of horse owners who use harness daily will have none other than the celebrated *Williams Quality*.

Our guarantee proves our confidence in our merchandise, guards our customers against disappointment and protects them against loss.

Turn to the harness pages of our big General Catalog, or write for the special book mentioned at the left.

IMPROVING POOR LAND IN MARYLAND.

The Quickest and Easiest Way.

[The following essay by J. E. Patton was awarded a prize by the Dorchester Pomona Grange. It is a compact statement of how to improve land in the Middle South. Much the same principles may be followed at the North by substituting rye, vetch, turnips and Soy beans.]

The quickest and at the same time the most economical way to improve poor land is through the use of legumes. Manure will help of course, but manure, like lime, should be used to help the legume. Clover and cow peas are the two great servants to be commanded in land building. If the land is too poor to grow clover, begin with cow peas. Other important points are proper drainage and deep plowing. Always go down to the subsoil, and after the first plowing turn up a little of the subsoil at each plowing, until the soil is of the desired depth (which you will never get too deep). Test land each year for acidity of soil, and if lime is needed apply at rate of 500 pounds to the acre after land is in good cultivation, then drag before seeding or planting the crop. A fourth point is thorough preparation of seed bed, and proper cultivation of growing crops; a fifth, rotation of crops.

Rotate crops as follows: First year seed the land to an early variety of cow peas, using 200 pounds acid phosphate and 40 pounds muriate of potash to the acre. In August double-disk the cow peas, then plow under and after the land is in proper condition and with a well-packed seed bed, seed to Crimson clover after a rain. Unquestionably wait for the rain, but keep the drag going at frequent intervals while waiting.

Second year top-dress the clover in February if the weather is favorable, with 300 pounds rock and kainit, equal parts, and just as clover begins to head out, plow under; then plant to corn, seeding Crimson clover in last working.

Third year, top-dress clover at usual time with 800 pounds rock and kainit, equal parts, plow under clover and plant tomatoes. Seed Scarlet clover in last working.

Fourth year, top-dress clover as usual with 300 pounds rock and kainit, cut clover at proper time for hay, then plant land to corn, seeding clover in last working. From this time on use the three year rotation, as mentioned in second, third and fourth years.

Tomato vines in hay are objectionable and it will be necessary to rake the clover field during freezing weather which will remove the majority of the vines. In this process of soil building there is just one cardinal point; put the fertilizer or manures always on the soil-building crop. But for the land's sake seed legumes wherever and whenever possible. Legumes, legumes, first, last and always.

THE CONCRETE MIXER.

I note on page 250 what Mr. Weaver says about mixing concrete. He admits that a mixer should be of sufficient size to handle a one-bag batch at one time, and then goes on and describes a mixer which is about half large enough for that, and which he claims is satisfactory. Why not construct a mixer large enough to take a one-bag batch at one time? All right, but do it different from what I did. I built one almost identically like the one Mr. Weaver describes except mine was twice the capacity and nearly four feet long. As the cost is a painful recollection for a poor man I will try to forget it. Probably my mechanical ability was not quite up to Mr. Weaver's. This mixer was sent to the junk heap because we could not get an even distribution of cement without taking a great deal of time. Several different men tried it besides myself, but we all had about the same results. If more cement than should be landed in one end or middle it staid there, though it mixed evenly with aggregate at that particular spot. The result was that each batch was a streaked mixture ranging from lean to rich. This might answer for underground foundations, but would not do at all for thin reënforced walls. Well, why not increase the diameter and decrease the length of a similar mixer? I have not tried this personally, but would judge two feet would be the limit in length permissible to insure uniform mixing. This would bring machine opening up quite a bit from the ground, and would make filling too slow. It would probably affect its stability also. Why tie up $15 to $30 in a mixer when the efficiency of a gang of men is not materially increased by so doing? Let each man think out for himself, on his own job, each act and motion that has to be gone through to mix a batch of concrete, both by hand and with machine, and estimate the time required for each, and probably in most cases it will be six of one and half dozen of the other. I know nothing about the large commercial mixers but as for homemade affairs, give me a square pointed shovel and a "sweatboard." MAURICE E. KENT.

Rhode Island.

Use of Fish-pots in Maryland.

Can the law stop me from fishing with fish-pot or wing fike on my own private land, where water flows only after big rains? At other times there is no water there. I find by Chapter 255 of 1910, it is unlawful to have fish-pots in any waters of the State; penalty not less than $25 nor more than $100 for each offense. J. E. E.

Greensboro, Md.

The following reply is made by State Game Warden Curley:

I do not know of any exception to the law prohibiting fish-pots. Of course the law is only applicable to rivers and streams, and if your inquirer does not set them in the same, but simply in a natural water course when it rains, I suppose it would not come within the provisions of the law, but I cannot imagine that there would be any fish in such a place.

The Henyard.

Breeding from Pullets.

Would 35 two-year-old hens be too many to mate with two yearling cockerels? Would you advise using pullets to breed from? They are purebred R. I. Red, hatched in April, were laying in September and in October I received 90 dozen eggs from 60. They have laid heavily all Winter, but seem full of vitality. I have a pen of two-year-olds that I keep to breed from, but would like to substitute some of the better marked pullets. The pullets paid me well, but the old hens rarely paid for their feed until lately. I would like next year to keep all pullets. Last year's stock was hatched from pullets and while the hatches were not remarkable, the chicks were strong and lusty. L. D. P.

Vermont.

One vigorous cockerel should be sufficient in a pen of 35 hens of the lighter breeds, and two would be ample for the heavier fowls. I should not hesitate to breed from well developed pullets, even though they had laid well all Winter; there is no adequate reason why their chicks should not be healthy and vigorous, as I have frequently demonstrated. The advantages of using old hens as breeders are that their eggs are larger, and the chicks hatched from them are consequently larger, and these old hens by living and laying for a year or more have demonstrated a vitality which the pullets have yet to prove; some of the pullets may be weaklings that will fail to stand up under egg production, and it would be unfortunate to hatch from such pullets.

Sour Crop.

I have a Buff Orpington pullet about 10 months old. She does not eat, and has not for about two weeks, only once in a while; she sits on the roost most of the time and when her head is held down a yellow kind of water runs out. Can you tell me what is the matter with her? R. W. M.

Hopewell Junction, N. Y.

This pullet may have catarrh of the crop, or "sour crop," due to the eating of indigestible food or poisoning by putrid meat or some other deleterious substance picked up by the bird. This disease is frequently a complication of some other trouble. The treatment consists in emptying the crop by holding the fowl head down and expressing the contents of the crop by gentle pressure and manipulation; after this about five grains of subnitrate of bismuth combined with two or three of bicarbonate of soda may be given, stirred up in a teaspoonful of water; this will relieve the acidity of the crop. Then remove the bird to comfortable quarters by herself and feed lightly upon soft easily digested food until she recovers.

Head-twisting Hens.

1. Some of my hens have a trouble which starts with a slight bending of the head to one side, which keeps getting worse and, when excited, they twist the head so that it is upside down and there is a rattle in the throat. Can you tell me the cause and also if there is anything I can do for them? 2. On page 1312, under "Poultry Notes," it speaks of cheap heavy spraying oil. Can you tell me of what it is composed and if it would be safe to use it in a brooder house for small chickens? House well ventilated; have been using one part of carbolic acid to four of kerosene for mites. W. F. H.

Massachusetts.

1. I cannot tell you what causes the peculiar actions of your fowls, having never seen anything of the kind that was not temporary, and apparently due to some local irritation which the hens were trying to rid themselves of. Irregular, purposeless, movements of the head are usually ascribed to congestion, or other disturbances, in the brain, very possibly a reflex from intestinal irritation due to the presence of worms or indigestion. A physic, as a teaspoonful of castor oil, could do no harm and might relieve the trouble.

2. I infer that the writer was speaking of one of the "soluble" spraying oils used by orchardists. These are oils usually derived from petroleum, so treated as to miscible with water, forming an emulsion. I know of no reason why they should not be as well adapted to brooders as to poultry houses, though I have never used them. The mixture that you are using is a very effective one, but probably more expensive than a spraying oil. M. B. D.

FEATHER PULLING.—Some time ago I wrote you asking about feather pulling; since then I have tried to cure it myself, and up to the present think I have cured the habit. Morning feed as follows: Oats, one pound; wheat, one pound; buckwheat, one-half pound; place same in a covered pan in which is a piece of lard the size of a butternut, melt and stir the same together, feed warm. Noon: Oats, one-half pound; buckwheat, one-half pound; mix with same amount of lard and let cool, then feed. Evening: Whole corn; raw meat twice a week. I have had no feather pulling since I started to feed the above, and my hens run together the same as ever. H. E. W.

Laying Ration.

I have a flock of 300 Barred P. Rock hens. Of the following grains, which ones, and in what proportion, are best for egg production? Corn, oats, wheat, barley, bran, sprouted oats, green cut bone, and plenty of beets and cabbage. Should beets be cooked and fed with meal as wet mash, or mash dry and beets raw, or a light feeding of wet mash and also dry mash before them all the time? Should breeders receive the same as laying hens? Give a good growing ration from the above grains for chicks after they are three or four weeks old. T. P.

Sterling, Ill.

All of the feeds that you mention are good for egg production, and none is "best." Sprouted oats are not needed where beets and cabbage are at hand, and vice versa. Green cut bone should be fed in moderation, especially to breeding pens. Beets should be fed raw, and these, also, should not be fed in excess. A wet mash is unnecessary, and undesirable, when dry mash is constantly before the fowls. Breeders should receive the same rations as layers, but they should not be fed quite as heavily and should be given more freedom and exercise. A good growing ration for chicks a month or more old is composed of cracked corn and wheat in equal parts for whole grain, and a mash made up of 30 pounds each of wheat bran, middlings, cornmeal, and beef scrap, to which 10 pounds of bone meal are added. (Cornell formula). Both whole grain and mash may be kept dry in hoppers constantly before the chicks on range, and one feeding a day of the mash moistened with skim-milk or water will hasten development. M. B. D.

Line and Inbreeding.

I wish to breed from my own stock. Will you inform with regard to line breeding, if I can do so and not inbreed? I have what I consider good pure stock, White Leghorns, and have picked some good cockerels from my own raising for breeding. W. E. L.

New Jersey.

The distinction between line and inbreeding is not very clear, though most writers seem to use the term inbreeding to describe a closer blood relationship than line-breeding. Mating a cock to his daughter would be called inbreeding; to a cousin, line-breeding. There is no good reason why you should not use males from your own flock, provided that you take pains to select the most vigorous and best developed birds of both sexes to make up your breeding pen. Careful selection should be practiced where inbreeding is the rule, as family defects are rapidly accentuated by inbreeding, and it is necessary to guard against this. M. B. D.

A PERMANENT ROOF

That's what every farmer wants—not a roof for today or tomorrow only—but a roof you can depend upon this year, next year and twenty years from now to keep out the rain and snow and remain unchanged under the torrid rays of the summer's sun or the snow and ice of winter. If a permanent roof of this kind is what is required

"RAIN-TIGHT" RUBBER ROOFING

will fill the bill. It is made of Trinidad Lake Asphalt—the standard Asphalt of the world. It is as near indestructible and everlasting as any roof can be.

Remember the so-called "cheap roofings" that must be repaired and replaced frequently are dear at any price. You will save money, trouble and eventually expense by buying "Rain-Tight" at the start.

Our brand of "Perfect Roofing" is the same as "Rain-Tight" with mica flakes added to the surface which make it fire-resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof.

Perfect Rosin Sized Sheathing and Perfect Tarred Felt are Best for Sheathing Purposes.

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us today.

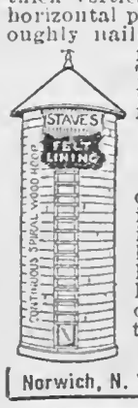
CRAINE SILO IT CAN'T COLLAPSE
The Craine Patent Triple Wall Silo has thick vertical wooden staves, inside; horizontal patent wooden covering thoroughly nailed, outside; and water-proof felt-like rubber roofing between. This makes a perfect non-conductor of heat. SCIENTIFIC in every feature of its construction.



IT'S FROST-PROOF
AIR-TIGHT PERMANENT
No silage spoiled by contact with concrete, tile or any mineral. Craine silage is sweet, clean and perfectly preserved—it is "drawn from the wood." No troublesome iron hoops requiring annual overhauling. The first cost is low and is the last. The Craine is, therefore, the cheapest on the market. Ask for illustrated booklet.

How I Envy Man.
TAKE OFF THE HORSE'S COAT ALSO

Do you go at the spring work with your overcoat on? Of course you don't—
Coats are a burden—you even roll up your shirt sleeves. Then how can you expect the horses to show proper energy under the hot sun with the same heavy coats on that they have worn all winter and which hold the wet sweat and dirt? Clip them before the work begins with a
Stewart Ball-Bearing Clipping Machine
They will get all the nourishment from their feed—be healthier and look better. They will dry off quickly, be more easily cleaned and feel better generally—that means work better. The Stewart Machine is not an expense—but a highly profitable investment. It turns easily, does more and closer work than any other machine—can't get out of order. Gears all file hard and cut from solid steel bar—protected and run in oil. Includes 6 feet new style easy running flexible shaft and celebrated Stewart's Single-Tension Clipping Head. The only machine that can be used without change for horses, mules and cows. You can make money clipping your neighbors' horses while yours will do better work. Each machine guaranteed. If it doesn't give perfect satisfaction, return it and get your money back. Complete from your dealer at $7.50
If he can't supply you send $2 and and we will ship one C.O.D. for balance.

Get More Wool
from your sheep, longer, better wool that will bring you from 15c to 20c more from each sheep. Your flock will feel better and look better also. The
Stewart No. 9 Ball Bearing Shearing Machine
will more than pay for itself the first season. Any boy can run it all day without tiring. All joints ball bearing with ball bearing shearing head. The equipment includes four sets of knives fully guaranteed. Price . . $11.50
If your dealer hasn't it, send $2.00 and pay balance C. O. D.
Chicago Flexible Shaft Co.

More Money From Your Hens!

Do You Want to Learn How?

WE are in a position to help you with your poultry. The best poultry writers in the country are ready to answer your questions, and will direct you step by step in the development and care of your flock. Through their help you may become an expert yourself, if you will follow their suggestions and take up a line of reading in connection with your practical work in the henyard. This service is free to all subscribers and their families. Make frequent use of it, and begin at any time.

Intensive Poultry Keeping.

What is the value of cob meal for poultry? Can it be fed to chickens ground corn and cob together? Is it practicable to do this with hand-power mill? I have one acre nicely adapted to poultry near a good market. Can I make a living on it? I would have to get about $500 per annum to pay expenses. I own my place and have money enough to establish a nice little plant; have kept small flock with good success for a number of years; am a practical gardener. B.

Brockton, Mass.

The cornmeal will not only be much better for the hens without the cobs, but will be much easier to grind; a great deal of power is required to grind cobs fine enough for feeding. But why grind either by hand? Your time and strength should be worth altogether too much to be used in this way. If you wish to utilize corn raised in your garden, feed it whole; its value is not enhanced a particle, except for small chicks, by grinding, or even cracking.

It would not be unreasonable for a good gardener located near a good market to expect to make $500 per year from an acre of ground devoted to poultry and gardening, but whether you can do it or not depends very largely upon your skill, energy, and strength, as well as to a considerable degree upon your ability as a salesman. My advice would be to be very niggardly in the use of your limited capital in building a poultry plant. Cut expenses on every corner until you become established in the business and know pretty nearly what you can expect in the way of income from your hens. Do not dream about more than 200 hens until you have made that number pay you fully as many dollars each year in net profits, and then, if you must dream about a thousand, try to wake up early. M. B. D.

The Hen With the Habit.

Prolific egg production depends upon the individual bird herself. Certain birds under adverse circumstances will produce more eggs than certain other birds that have the best of everything in the way of food and shelter. The persistent layer is qualified by inherited tendencies to produce eggs. No art of man can induce a hen to lay a large number of eggs unless she is that kind of a hen. Proper handling will induce her to do her best. Proper handling will induce some colts eventually to get a mark of 2:10. No amount of handling will make certain other colts show better than a four-minute gait. The same principle applies to the hen.

Arbitrary rules for care and feeding are not necessarily associated with large egg yields. The hen with the habit will lay anyway. And unless she has this inherited tendency she is not the hen to keep, certainly not the one to breed from. Success and profit result then from the heavy layer surrounded by ideal conditions. Nowadays the 200-egg hen is quite common throughout the country. She is the backbone of many a flock, and lends a helping hand to many a worthless sister hen whose body would grace the dinner table could she be identified. Unfortunately in the majority of flocks neither is known. What's the answer? The trapnest! Starting in October with 100 pullets and 20 trap-nests, March 1 will find the flock divided into say, three classes. The record sheet with show perhaps 20% that have each laid from 18 to 25 or more eggs per month. These pullets if they show all the qualities necessary to make good breeders will be retained as the nucleus of a breeding pen. Sixty of the remaining hens will perhaps be productive enough to keep until the end of their first laying period. The remaining 20 will go or will have gone already to the poultry market. Scientific line-breeding follows. A strain of prolific egg producers is not the only goal. Not only must the birds be able to pass down to their progeny the tendency sought for: they must also prove to be birds that will transmit a sound, vigorous constitution.

Henhouse for Brooding.

Could I use my 6x12 henhouse, board floor, for a brooder house, heating same with an oil stove or lanterns? If I may use this house for purpose mentioned, when shall I start my incubator in order to get best results? Should I use my floored house as brooder house, how long may I keep chicks in same? Is it not necessary that chicks have sand or soil upon which to walk, to prevent leg weakness? H. S.

Rhode Island.

You can use your henhouse for a brooder house if you warm it in some way but will have to have hovers of some kind to care for the chicks at night. The adaptable hovers made by several prominent manufacturers are well suited to use in such a building and do away with the necessity of heating the whole building. If this building has been used to shelter hens, you will have to take special pains to rid it of lice and mites before putting young chicks in it. Chicks should not be kept indoors upon board floors for more than three weeks. Fresh sods and dirt for the chicks to scratch in are of great value in a brooder house. I do not care to have chicks hatched before the last of March or later than June 1. If I could arrange it to suit me exactly, I would have every chick on the farm hatched on the first day of April; joke, or no joke. M. B. D.

Discolored Combs.

I have recently purchased some White Wyandotte hens, and I noticed that the comb and wattles of one of them was as I thought rather dark in color, but as they appeared to be otherwise healthy I did not think any thing serious the matter. Now another one of them is afflicted in the same way, the combs and wattles of the two are so longer red, but a dark and dull purple, and they now appear listless and somewhat droopy. Can you tell me what is the matter and what remedy? T. A. R.

Indiana.

A diagnosis cannot be made from the discoloration of the comb alone, as this is a symptom common to various diseases. Anything that would produce obstruction to the circulation would cause the comb to turn purple. This symptom is seen in diseases of the respiratory apparatus caused by the presence of molds or fungi, and it would be equally prominent if the action of the heart were disturbed by some disease, or disturbance of function, of that organ. I would suggest that you remove these birds from the flock to protect the rest from possible contagion, and watch for the development of other symptoms which may give you a clue to the nature of the disorder. M. B. D.

Limberneck.

I notice on page 164, J. W. N. has previously asked for a remedy for limberneck in chickens. I notice that the answer is the ax. For six years I have raised each year several thousand chickens; have had a few cases of limberneck which I have never failed to cure by giving one to three doses of castor oil, not less than a teaspoonful at a dose. If the case requires it, I give a dose in the morning and another at night. I have never given more than three or four doses and never had one die.

New York. J. B. CASTERLINE.

This treatment is a rational one. If limberneck is caused, as is supposed, by ptomaine poisoning from the ingestion of putrid meat, or other poisonous food, a flushing out of the digestive tract by a good cathartic is the obvious thing to do, and where enough of the poison has not already been absorbed to cause death, the fowl should recover. M. B. D.

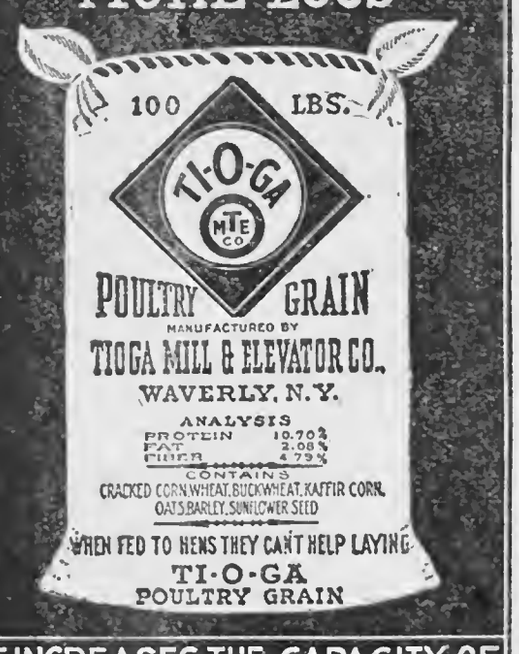
MAKES HENS LAY MORE EGGS



IT INCREASES THE CAPACITY OF GOOD HENS, AND MAKES EVEN A POOR HEN DO HER LEVEL BEST

The Henyard.

THE EGG-LAYING CONTEST.

The nineteenth week of the contest shows a further gain of 516 eggs; the output for the week being 3,173. This is almost four eggs for every bird in the contest. Storrs Agricultural Station pen of White P. Rocks take first place with a score of 51, and the single pen of Buff Leghorns from Grand Rapids, Mich., are second with a score of 50. Frank L. Tuttle's pen of Barred Rocks are third, with a record of 49, and P. G. Platt's White Leghorns fourth with 48 to their credit. Forty-five pens have records of from 40 to 47 eggs each.

In the contest at Thorndale, Pa., Tom Barron's White Wyandottes lead all the pens of any breed, and his pen of White Leghorns stand next to his Wyandottes as the second best pen. The highest scoring hen is a Barred Rock, which has laid 105 eggs in the four Winter months. At 48 cents a dozen she has earned $4.20 in the four months, and has all the rest of the year to earn the cost of her feed. In the Thorndale, Pa., contest there are but five birds in a pen, the same number as in previous years at Storrs. This makes it easy to compare the records made from week to week for the three years to date. These records show that nearly every week gives a gain over the corresponding week of the previous year. This continuous gain in egg production is of immense value to the whole United States. It is stirring up breeders everywhere to produce better layers; it is showing up the possibilities of the business, and the result can hardly be other than greatly increased egg production, and the adding of millions of dollars value to our agricultural productions. That those who are interested in the performance of certain varieties may see how their breed lays a Storrs, I give the record below.

MAPES THE HEN-MAN GIVES FIGURES.

PART II.

Money on good farm loans is freely offered in our country at 5%. The value of fertilizer or poultry droppings, which have not yet been drawn into the account, will easily take care of that. I consider them worth about 10 cents per hen a year. I inventory the 1,800 hens on January 1 as worth about 80 cents each, when a fair proportion of them are pullets, making $1,440. That is a third more than they would bring as market poultry. I attended an auction sale last November within about 10 miles of me where over a thousand well-bred White Leghorns were sold, most of them being April and May hatched pullets. They were sold in lots of 50 and not a single lot reached the dollar mark. Most of them went around 70 cents; 5% on $4,440 amounts to $222. Deduct $180 value of fertilizer, and it leaves $42 for interest to be provided for out of the $5,000 from eggs and market poultry.

There is no depreciation on birds to be provided for as the flock averaged younger at the close of the year than at the beginning. I ran one of the brooders the second time and managed to raise about 1,100 pullets from 3,720 eggs incubated. Some of the increase of 800 birds on hand January 1 consisted of unsold cockerels, which accounts for the apparently low value I placed on them.

For the item of depreciation on buildings I hardly know what to allow. Probably interested readers can give as good an estimate as I. Most of it will be on the roofing. Most of the roofing used is guaranteed for 10 years without painting, so I think 2% will be liberal. This makes the account stand like this:

DR.	
Grain and feeds	$2,366.00
Coal, 4 tons at $4.40	17.60
Kerosene	6.00
Interest, $4,440 at 5%	222.00
Depreciation, $3,000 at 2%	60.00
Express charges	100.00
	$2,771.60
10 tons of mangels	40.00
	$2,811.60
CR.	
Eggs, sold	$4,100.00
Poultry, sold	438.35
Increased stock	500.00
Fertilizer	180.00
	$5,218.35

The balance of $2,406.75 is left for labor and oversight. Where both are done by the owner, as in my case, I think the correspondent, page 460, has most of her questions answered. Her letter found me fast in bed with a lame back, so that I have not been near the hens in over a week. The work is well enough systematized so that my one hired man was able to match the poultry work and dairy work together at a moment's notive and keep both running smoothly without any overtime work. I doubt if the hens have missed me. This gives him entire charge of 17 head of cattle (10 milking) three horses, and over 2,000 hens, and includes a daily trip to the creamery four miles away.

One pen of September pullets is just beginning to lay. The day they were five months old the thermometer was 10 below zero and he proudly brought in 15 pullet eggs from that pen to show me, as proof that he is holding down my job. He reports that 3½ hours is the most he has had to spend on poultry work any one day, and some days only 2½ hours.

There may be some places where 11 good cows with corresponding young stock, buildings, land, and equipment can be bought for less than $4,440, but they surely are not to be found in Orange County.

My little poultry plant is not large enough to be dignified with the name of a "business." It is more in the nature of an old man's diversion, but it seems to show how a rugged young farmer and working wife with good health, good judgment, and sufficient capital could make their farm "hum" so that the tide of humanity rushing cityward would stop and listen. To those already in the city having scant capital and experience I would say "beware the rocks."

O. W. MAPES.

PROFESSOR AT AGRICULTURAL SCHOOL: What kinds of farming are there? New Student: Extensive, intensive and pretensive.—Indianapolis Star.

Bitter Milk.

What is the cause of bitter milk? After setting away a while both milk and cream risen from pans are very bitter; makes good butter, and only tastes after it is a day or more old. M. E. W.

Scientific men tell us that certain bacteria will live and thrive in milk during cold weather, that is when the temperature is too low for the growth of the lactic acid bacillus which, as everybody knows, causes milk to become sour. These cool weather bacteria leave a bitter taste which is more noticeable when milk is not sour as well. My experience is that milk from strippers is more apt to turn bitter than milk from fresh cows; however, I know of no scientific backing for the latter statement. C. S. M.

Q AND A

Storing Butter.

How can I store my butter so it will keep for six to eight months? M. W.
Palisades, N. Y.

Butter for keeping a considerable length of time should be washed quite thoroughly, until the water comes off the butter quite clear. After this the main thing is to keep the butter as cold as possible, and free from strong odors or taints of any kind. A good cellar would be all right for keeping butter if well ventilated and free from odors, but most cellars do not come up to this standard. C. L. M.

The Proof of any Silo is in its Silage

IF your silage is perfectly cured, succulent and palatable, free from mold, uniform from center to circumference, untainted by foreign matter; if it is not damaged by freezing in winter and never loses its flavor or juices through leakage or absorption, then you have a good silo. If you do not have these things you are not getting the results you are entitled to. The

INDIANA SILO

as it is built today is the result of years of progress and manufacturing experience. It is made with the primary purpose of preserving the contents perfectly; it is constructed throughout of selected material.

Wood is a non-conductor and retains the natural heat which is necessary to secure perfect silage.

Our staves are cut from the choicest timber, carefully selected by our own experts at the mills.

There is no metal in the Indiana Silo to corrode, no plaster to crumble, no masonry to crack when the foundation settles.

For these reasons the contents of an Indiana Silo are always the best. More Indiana Silos are in use on American farms today than any other make. The first ones built are still standing and giving complete satisfaction to their owners.

Read the book "Silo Profits" which is written by hundreds of owners of Indiana Silos. It tells what the Indiana Silo has done for them and what it can do for you.

Turkeys	28	@	32

PRODUCTS, PRICES AND TRADE.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Miscellaneous wholesale prices at New York are mainly as previously reported, $1.81 and $1.71 per 40-quart can for B. and C., though less of the latter is arriving because of health board restrictions.

*

Butter has declined three cents during the week, best creamery now wholesaling at 25 cents. A great effort is being made to get rid of the storage creamery, prices on medium grades having been cut to 19 to 21 cents. The small amount of fancy State dairy arriving brings 24 cents, but most receipts are of lower grades, worth only 18 to 20.

*

Old cheese, particularly colored stock, is very scarce, and one cent higher. The supply of white is a little larger, but the market as a whole is in strong position. Prices in Canada at present are too high to encourage imports from that country. The low prices of butter and high figures for cheese are naturally turning more milk than usual into the latter, so that the output of new cheese is expected to be considerably increased.

*

The egg market is unsettled, prices running eight to nine cents per dozen lower than last week. Receipts for two days at New York ran over a million dozen. The top wholesale price for fresh eggs is 22 cents. This includes everything but large whites under special contract, and casual sales to customers who are looking for something extra choice and willing to pay a premium for it. Prices are now on a level with last year.

*

The embargo on potatoes from Holland has now been removed by the Department of Agriculture, as that country is considered free from the diseases which caused the quarantine.

*

Captain Polack, of the North German Lloyd, has just made his 200th trip across the Atlantic. He has been working for the company since 1886, and a captain since 1897.

*

Port Arthur, in Southeastern Texas, leads all ports in this country in grain shipment, the movement there in 1913 being 203,000,000 bushels, which is 25,000,000 bushels ahead of the next largest port, Buffalo.

*

The number of domestic animals in Germany, according to one of our consuls, is as follows: Poultry, 82,474,317; hogs, 21,885,073; cattle, 20,158,738; horses, 4,516,297; sheep, 5,787,848; goats, 3,383,971; hives of bees, 2,619,891.

*

Our trade balance, that is the excess of our exports over imports, for the seven months ending January 31, was about $454,000,000. Our exports for this period totalled $1,522,100,000. Our largest customers are England, Germany, Canada and France.

*

The telephone combination had net profits of $32,920,090 to turn over to stockholders January 1, making a dividend of 9.55 per cent. The number of daily telephone connections averaged 27,237,000, and there is a 16,111,011 mileage of wire.

*

The wool market in the East has been very dull. Some recent prices are: Michigan and New York, unwashed Delaine, 22 to 22½; Ohio half blood combing, 24 to 25; Kentucky, three-eighths blood, unwashed, 23 to 24. Shipments of wool from Australia to the United States for seven months past amounted to $1,556,255.

W. W. H.

Stop Feeding Butter Fat to the Hogs

—You Can Feed Them BETTER on Food That Costs a Lot Less

RUNNING your cream separator at the wrong speed leaves one-fifth to one-half of the cream in the skim milk which you feed to your hogs. Yet nobody on earth can turn the handle of a separator at the right speed by "guess."

The Stewart Speed Indicator stops all the waste and pays you 20% to 50% more butter-money because it keeps you turning exactly the proper number of revolutions per minute.

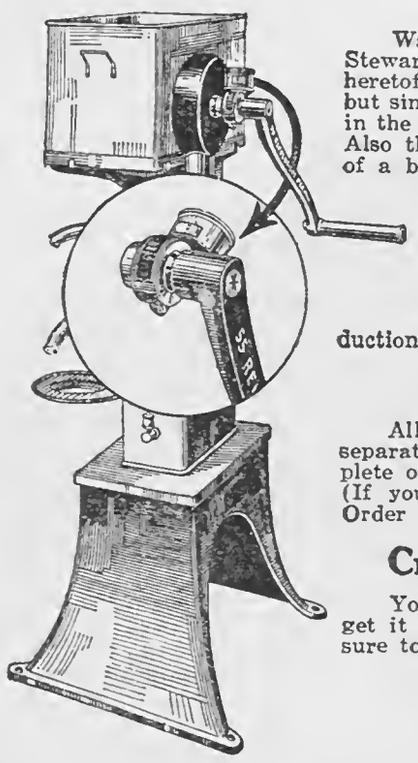
The "Kansas Farmer" says—"It is easy to lose the butter-fat (cream) of 2 or 3 cows in a 10 or 12 cow herd by incorrect cream separator turning." Dairymen have lost thousands of dollars just that way. But NOW hundreds of long-headed dairymen are saving the cream they used to waste—saving it by using a Stewart Speed Indicator on their separators. The

Stewart Speed Indicator for Cream Separators

goes on the crankshaft and shows how fast you are turning the crank-handle. The maker of your separator has already told you just how fast to turn it. If he says "55 revolutions" he means just that many—not even one more or one less per minute.

Just Watch the Stewart

Keep your eye on it as you turn the crank-handle. If it says "55," then you are cranking at the rate of 55 revolutions per minute. If it goes above or below that mark you must slow down or speed up, as the case may be. Keep it right there. No counting or timing is ever necessary—the Stewart tells at a glance.



For sale by Agricultural Implement and Hardware dealers all over the world.

"A Great Saving of Cream"

Walter L. Griffith of Wisconsin writes us: I find that the Stewart Indicator is a great help in many ways. I have found heretofore when separated milk stood, that cream would rise on it, but since using your Indicator there has been absolutely none, which in the cost of a year's time will amount to a great saving of cream. Also the cream gives a higher test and seems to be more even and of a better quality."

One dairyman with 20 cows lost $524.10 in a year by guessing at the speed he was turning the crank handle.

Another dairyman writes that he has 8 cows and that guesswork lost him $18.50 in one month.

How about YOU? Are you willing to throw cream to the hogs? Put a Stewart Speed Indicator on your separator and watch results. If it does not increase your cream production, then take it back within 30 days and get your money.

Price $10—Easy To Put On

All you have to do is to tell us the name and number of your separator, and the year it was made. We furnish the Stewart complete on a new crankshaft that you can easily install—all for $10. (If yours is a De Laval, then no extra crankshaft is necessary.) Order from your dealer or direct from us.

LIVERPOOL, - - - NEW YORK

When you write advertisers mention The R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page. : : :

PUBLISHER'S DESK

Some time in January, as you will see by card I am sending you, this man W. Bradley of Brooklyn, N. Y., called upon about every milkman in Saratoga Springs (about 30 in number) selling individual cream dippers to dip cream from milk bottles, and the "Dairy World," as you will see on slip. Up to this time no one has received cream dippers or the paper. Each man paid his $2. Is this a fake deal or what is it? I am writing you thinking perhaps you might help us, but don't know that you can, as he gave no number in Brooklyn. We are all in the same boat anyway. G. C. W.
New York.

There is no paper so far as we know that is known as the Dairy World. The Jersey Bulletin of Indianapolis, Ind., is known as the Jersey Bulletin and Dairy World, and we find in the February 11th issue of that publication a warning is given against G. E. Mayo of New York City, who is alleged to have been working this same game. This notice will serve as a warning to dairymen generally to beware of these agents going about the country offering to sell cream dippers in connection with subscriptions to the Dairy World or other publications. Getting money under false pretenses is a criminal offence, and agents who practice it are liable to arrest.

The recognition of your 35-cent dollar for the farmer in Governor Glynn's special message on coöperative marketing is the best yet. It is now receiving recognition by speakers and the press everywhere. It has taken many years of hard pounding, but you are breaking in at last. W. H. K.
New York.

Seventeen years ago, there was a big fuss raised in this country about the 50-cent dollar. When the excitement subsided, we called attention to the farmer's 35-cent dollar. We have repeated the reference persistently ever since. Four years ago the New York State Agricultural Society took it up and now the air vibrates with the injustice of it. Sometimes it seems monotonous to harp everlastingly on one subject, but it seems the only way to drive an injustice home to the American people. But when they grasp the meaning of an economic and moral subject, it is hard to hold them in check. The 35-cent dollar must go.

To my utter astonishment I find this under the caption of an "old breeder's sage counsel," in the text columns of "The Country Gentleman," by one Frank R. Johnson:

"Did you always know how to price a bird in answer to an inquiry by mail?" asked the young breeder, who in his growing interest had moved his chair closer to me and permitted his cigar to go out.

"I did not," I confessed. "I used to study those letters of inquiry over and over, read them back and forth and between lines, endeavoring to get some insight into the writer's character, liberality, business judgment and so on, When I could not satisfy myself as to just where he belonged—whether in the liberal, conservative or close-buying class—I sat down to the desk and wrote three descriptions on three different sheets of paper of the same bird, pricing description No. 1 at $15, description No. 2 at $20, and description No. 3 at $25. That developed the situation. If the prospective purchaser was a sensible close buyer he bought on description No. 1. If he was one of those persons who measure their own and everybody else's importance by the dollar standard he promptly ignored descriptions Nos. 1 and 2 and mailed a check for bird priced under description No. 3. He would then point with pride to the bird and boast of the price he paid. Under some circumstances salesmanship of this kind might be subject to criticism, but you who have been in 'the game' any length of time cannot count upon the fingers of both hands the sales you have lost because you did not make your price sufficiently high to meet the idea of the purchaser. So it averages up after all."

Shades of Dawley! What is new about this fake, except the bold brazen way of publicly admitting the swindle and bragging about it? I can see how a man tainted with the practice could be insensible of the theft, but I fail to understand how the editor of a respectable farm paper should publish it to the world, and commend it to young breeders as "sage counsel." Mr. Johnson has confessed to a record that bars him forever from the advertising columns of THE R. N.-Y. His salesmanship may be successful, but his ideals are not, to say the least, of a high standard.

I have just read in THE R. N.-Y., page 246, Dr. Ulman's letter and your reply to him. I want to shake hands with Dr. Ulman, and you may add me to your list, towards 100 members. THE R. N.-Y. has done more for its subscribers than all the other papers put together, and now, with the help of the subscribers you can, I believe, in a short time put most of the fakers out of business. You have my hearty support in your new undertaking. I would like further to suggest that each member of the society send the secretary a list of all the papers he or she takes, excluding the daily newspaper, and also notify him and THE R. N.-Y. of any advertisement appearing in any of the papers having the odor of a fake. When such advertisement has been proved to be dishonest, the secretary should write the publisher and request him to discontinue publishing the advertisement. Should the publisher refuse to do as requested, then notify him of the number of his subscribers who will discontinue his paper unless the request is granted. It would not be very long before the publishers would be careful who they admitted to their columns.
Maine. A. F. J.

When I made the suggestion to organize an anti-fake society when a hundred readers had signified their willingness to become charter members, I did not know how much personal interest our people would take in the subject. Dr. Ulman and some others had persisted in sending us money to keep up the fight, and the suggestion for a voluntary society was made on the spur of the moment, but I have had several strong enthusiastic letters on the subject. The above letter gets clear into the marrow of the subject. I am chairman of a vigilance committee that is trying to discourage dishonest advertising. I have often pointed out that publishers dominate the situation. No dishonest advertiser could exist if the publisher refused to go into a conspiracy with him to rob the public. If we succeed in making the publisher feel his responsibility we will have no dishonest advertisers in the public press.

Charges of fraud are made in a suit brought in the Supreme Court by P. Berry & Sons of Hartford, Conn., against Johnstone & Coughlan, commission merchants. Among other things, Johnstone & Coughlan, highly regarded in the trade, are alleged to have bought thousands of tubs of inferior butter in the open market, scraped the tops of the tubs, substituted the name of McDermot Dairy, a maker of high grade butter, and sold the product. This is made a crime by the agricultural laws of the State, punishable by a fine of not less than $100 for each violation. Frank M. Coughlan, junior member of the firm, admitted the charge, and said that this was a custom of the trade and that no one could tell what butter he was eating by looking at the marks on the package.—Daily Paper.

It seems that Berry & Sons are jobbers. The commission merchants claim they knew or should know that the brand was not genuine, and that the same thing is done every day in the trade. This comes pretty near corroborating Gov. Glynn's advice that commission merchants are speculating in food products to the disadvantage of both producer and consumer.

You say you do not know the David Rising Seed Co., of Easton, Pa. I do. David Rising came to this section a year ago. He sold a lot of seed around here, and all paid him in advance except myself. On the order blank he refers to the Easton Trust Co. To my inquiry they replied that he carried a small account, but they did not know him and would not recommend him. I cancelled order and received threat to sue, etc. About April first last he delivered some very poor seed to a few of his customers, and to others none at all. Several of these got together and caught him in Flemington one day, and had him arrested. I was told that he returned the money. If the information is any use to you or your neighbors, I shall be repaid for the time and trouble of writing you. C. T.
New Jersey.

It is a pretty hard matter to elude THE R. N.-Y family. Schemers meet them everywhere, and the beauty of it is that one is always willing—I was going to say glad—to be of service to all the other members of the family. Ordering seed from a concern you do not know is a serious matter. The cost of the seed is trifling; but when you consider that it may result in the failure of a season's crop, you get at the extent of the possible loss. J. J. D.

"WHEN I was on the ocean and saw its boundless extent, I said to myself, '*Sic transit gloria mundi.*' Didn't you feel the insignificance of life that way?" "No; I never got beyond the sick transit."—Baltimore American.

THIS STEEL TRACK HAY CARRIER

Open bell, swivel reversible. Can not pass trip block while in operation. Easily reversed from the floor. Constructed of malleable iron. Travelers and sheavers revolve on turned bushing. Of recognized superiority, combining all the valuable features that experience has demonstrated to be desirable. With our No. 100 sling pulleys it makes a complete sling carrier.

ROCHESTER HAY, FEED and LITTER CARRIERS, WATER BASINS, DIVISION

STALLS and STANCHIONS are universally popular and our testimonials for their superiority are the best. Satisfaction guaranteed.

Let us send you FREE our 46-page catalog with complete descriptions, beautiful illustrations and splendid testimonials.

INTERNATIONAL Harvester oil tractors rank first as machines for all-around farm use. Enumerate a dozen of your farm operations and you will find these tractors—Mogul or Titan—can be used with profit in all.

They furnish reliable power for all belt machines and for disking, plowing and other drawbar work. Features which make I H C tractors valuable are the truck design, the large mainshaft and its long bearings, the power starting system, the dust proof engine—features of proved value which you find on all I H C tractors.

I H C tractors, Mogul or Titan, are simple, strong, and easily operated. They are built in all sizes, 6–12 to 30–60-H. P., and in styles to meet the needs of every good sized farm. The I H C line also includes various styles of general purpose engines from 1 to 50-H. P., operating on high and low grade fuel oils.

Write us for catalogues and other information about tractors and engines.

WEATHER AND CROPS.

From all accounts the peach crop in Western New York is ruined. The Fall was such that the trees did not harden off well, and the mercury has been several times down to 16 below or more in the peach belt. All growers report the same thing: that it is impossible to get more than a small per cent of the buds to bloom when taken into the house. Of course it may not be as bad as they think, but I am satisfied that if the statement is true that 16 degrees below ruins the crop, then it is a goner sure. C. I.

Rochester, N. Y.

The main money crops of this section are potatoes and beans. Potato buyers are offering 35 cents for white stock. Beans are all bought up on a hand-picked basis of $1.60 per bushel. Cattle buyers and local butchers pay 4½ to five cents for beef cattle, live weight. Dressed hogs nine to 10 cents per pound. Very few cattle or hogs to be had. Butter 28; eggs 25 in trade. R. T. S.

Empire, Mich.

We have had more snow this Winter than I ever knew before, and some of it fell in such masses as to break down orchards and forests. The ground has been covered with snow most of the time, making conditions ideal for Winter wheat. The roads have been very good, with excellent sleighing nearly the whole Winter. Much hauling of supplies for the farms has been done, such as ice, lime, fertilizer, logs, lumber and wood. Marketing of last year's crops is practically finished. However, dairying and fruit-growing have almost taken the place of general farming here, and these two occupations require market trips throughout the year. Our soil is glaciated clay, or Volusia silt loam, and when the soil is depleted of its lime and phosphorus, general farming will not pay. Corn in 1913 was immature on account of early frosts, and molded in the crib. Farmers are importing Ohio corn at 36 cents per 35-pound bushel, freight paid. Hundreds of carloads will be brought here before corn comes again. Last Fall the potato crop was good; it is selling now at 85 cents a bushel wholesale. Apples were a light crop, on account of the May frost and the Summer drought. Those on the hills who had frost drainage (air drainage) have good crops to sell now. As apples are around $6 a barrel, wholesale, they are a profitable crop this year. It must be remembered, however, that this year is an exception, and a very rare one. The present writer never before, in a somewhat lengthy life, saw apples so high, and never expects to see such prices again. Consequently, he would advise intending growers never to expect to get $6 a barrel for their apples. A senseless law requiring commodities to be sold by the pound instead of by the bushel was recently passed. It adds to the trouble of doing business and to the cost of living. Farm sales are in progress and prices rule high. Orchardists are spraying the dormant trees for scale and fungous pests. Considerable plowing for corn has already been done. Mareh came in with a blizzard, and according to tradition we expect his lion-like entrance to give promise of a lamb-like exit and an early Spring. J. C. M. J.

Lawrence Co., Pa.

Wheat 94; oats 40; potatoes 70; butter 30; eggs 28; chickens 14 live; ducks 12; turkeys 18. Cows are selling from $40 to $100, and extras more. M. H.

Dalton, O.

We are having real Winter weather, with lots of snow; stock wintering well; wheat looking fair. Fat cattle 7¾ to 8, and scarce; good dairy cows $50 to $75; horses $150 to $250; hogs 7 to 8 cents; butter 28 to 30; West Jefferson creamery 40 to 45; eggs 22. Hay, mixed, $14 to $15. Extra Timothy $17 to $19; straw $8 to $9; corn 65; oats 50; wheat 93; potatoes $1.10; apples 4 cents per pound; cabbage 3 cents a pound; poultry, hens, 13 to 14; roosters 15; springers 15.

Fultonham, Ohio. H. W. H.

Good milch cows sell at from $60 to $100; fancy stock more. Butter fat 30 cents; country butter 25; milk eight cents per quart; cream 30 cents per quart; fat cattle from six to seven cents per pound; hogs on foot seven cents; dressed 10; corn 65; wheat 95; oats 40; hay $10 to $14 per ton. Apples, best quality, $6 per barrel; Ben Davis $4.50 per barrel. Cabbage $4 per barrel; potatoes $1 per bushel. Chickens on foot 12 cents per pound; eggs 25. Hired men receive about $30 per month and board, or if married they get a large garden and house, furnished, instead of board. Most of the desirable men are hired the year around. R. W. L.

Corning, Ohio.

Horses $150 to $250, rather dull at present; cattle, fat, seven to eight cents; stockers 6½ to 7½; hogs, fat, 8 to 8½; sheep, very few changing hands; chickens 13½ cents, live; corn 59 (shelled); wheat 90 to 92; oats 37; barley 55; potatoes 75; rye 54; Timothy seed $1.50; clover seed $7; Alsike $9.25; Timothy hay $10 to $12; mixed hay $7.50 to $9.50; clover $6 to $8. tter 26; eggs 23; lard 12. Everything slightly lower than one year ago. More farms for rent than usual at this season of year. J. B.

Columbus Grove, O.

Farmers are not well enough organized to command any better prices than are offered by local merch nts or transient buyers. Good apples bring about 75 cents per bushel. Some fancy ones $1. Butchers get our pork dressed for less than the price of live hogs in Chicago. The farmers seem to think they can accomplish little by organizing, unless the consumers of our products would organize. Q. M.

Elk Rapids, Mich.

Glencoe is a mining town. Generally we get better prices than they do in similar locations. Hay from $15 to $18; straw $7 to $8; butter 32 cents; eggs 30; hogs $8.50 on foot; $10.50 dressed; cattle from $7 to $7.50, on foot; cows will run from $40 to $60; yearling calves from $20 to $25; corn 80; oats 50; wheat 95; potatoes 90; apples $1.25. All fruits scarce on account of frosts last year.

Glencoe, O. J. H. G.

March 10. We have had pretty steady Winter since the first of February, and some cold days, so much so that I cannot find a live fruit bud on our Kieffer pears, these seeming quite far advanced. The Japan plums are also Winter-killed, and I wish the trees were too, as I still spared some of them, but never got enough fruit to be worth while. The natives are more satisfactory all the while, and the Europeans are satisfactory, though not so sure a crop as the natives. For some reason our peaches seem unharmed, though I expect the buds are Winter-killed in lower places, where the thermometer registered 14 to 17 below. There were some apples last season on the hills, or where there was good air drainage and in such places there is not such a good setting of fruit buds on lower ground, but where the crop was killed by the May frost last season the trees are fairly set with fruit buds, and with the cold weather holding on so long it seems like a good prospect for a crop of apples for the coming season. C. W.

Wayne Co., O.

Horses $125 to $250; cattle, prime, 8½; butcher stuff, 5 to 7; cows, dairy, $40 to $75; butterfat 27; country butter 25; eggs 28; chickens 14; hogs 8¼. Hay, Timothy, on track, $11.75; clover, choice, $10.75; wheat 92; corn 70; oats 45; rye 70; potatoes 80. This is not much of a fruit country around here, and fruit was a failure last season. Apples retail at the stores at 70 to 80 cents a peck, one or two for five cents. There is no truck raised for the market here, only near the cities. N. B.

Atherton, O.

Butter 20 to 25 cents to the producers, 25 to 30 cents at retail. Those who have private customers obtain five to 10 cents more on the pound for butter and five cents more for eggs. Milk retails all the way from six to nine cents. Milch cows from $45 to $100 per head, although some good ones brought as high as $150 at sales this Winter. The range of prices for cattle and hogs at the stock yards at Oklahoma City, eight miles south of us, are for cattle $5.25 to $8.50, according to grade; hogs from $7.75 to $8.75 per head. During the growing season we have a truckers' market at the city, where the producer and consumer get together to their mutual benefit. The following are the retail prices: Potatoes 95 cents to $1.25; cabbage 3½ cents per pound; turnips, carrots, etc., about the same price; lettuce 15 cents a pound; onions 5 and 10 cents per pound; apples $1.75 to $2.75 per bushel; wheat 80; corn 68 to 70; oats 42 to 45; Kaffir corn $1.25 per 100; Alfalfa hay $13 to $15; prairie hay $12 to $14; cane hay $8; straw $5. Hens 13 to 14 cents per pound; turkeys 15; ducks 10; geese 8. Our normal rainfall from January 1 to date (March 14) should be over three inches, but so far we have had less than one inch. The weather is pleasant, but it still freezes nearly every night. Some oats have been in the ground about six weeks. C. A. D.

Britton, Okla.

Peach Prospects in Texas.

After considerable Summer weather in January, one day with the thermometer at 80 in shade, on February 7 real Winter came along, with thermometer close to 10 (above). Some of the peaches had started to bloom, all buds, plums, peaches and Kieffer pears, were considerably swollen, ready to open into full bloom within a few days. The result of course spelled disaster, especially since the hard freeze was followed by bright sunshine, thawing during the day and again freezing the following night. We have had since several more freezes, though not quite so bad. The result is today, March 4, Kieffer pears, seem to be all destroyed; Elberta peach likewise. Of my new ones, Eva and Millford fared the same as Elberta, hardly a live bud left. Of the others, Tena and Frank suffered least; they have enough blooms left for several crops, while all the rest, with favorable conditions from now on, can yet bring fair crops. I understand the J. H. Hale peach covers the time of Elberta and it will produce good crops when Elberta fails. The Tena comes in as Elberta goes out, and it is every way superior to Elberta, escaping when Elbertas are all killed. Ought not this eliminate that variety from our list of profitable sorts? This is a hard blow for the growers of our State, because during the last 15 years fully nine-tenths of the peach orchards set out, have been at least three-quarters Elbertas. Thus, when there is a good crop generally, there are more Elbertas than can be made use of in any way, there not even being one-tenth enough hogs to eat the surplus. On the other hand, failing so often, there is disaster any way it comes. The fact really is, the peach business in Texas of late years has been greatly demoralized, from as I see it a combination of causes.

Texas. J. W. STUBENRAUCH.

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

DO YOU NEED FARM HELP

We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. Ours is a philanthropic organization and we make no charge to employer or employee. Our object is the encouragement of farming among Jews. **THE JEWISH AGRICULTURAL SOCIETY, 176 Second Avenue, New York City.**

Subscribers' Exchange

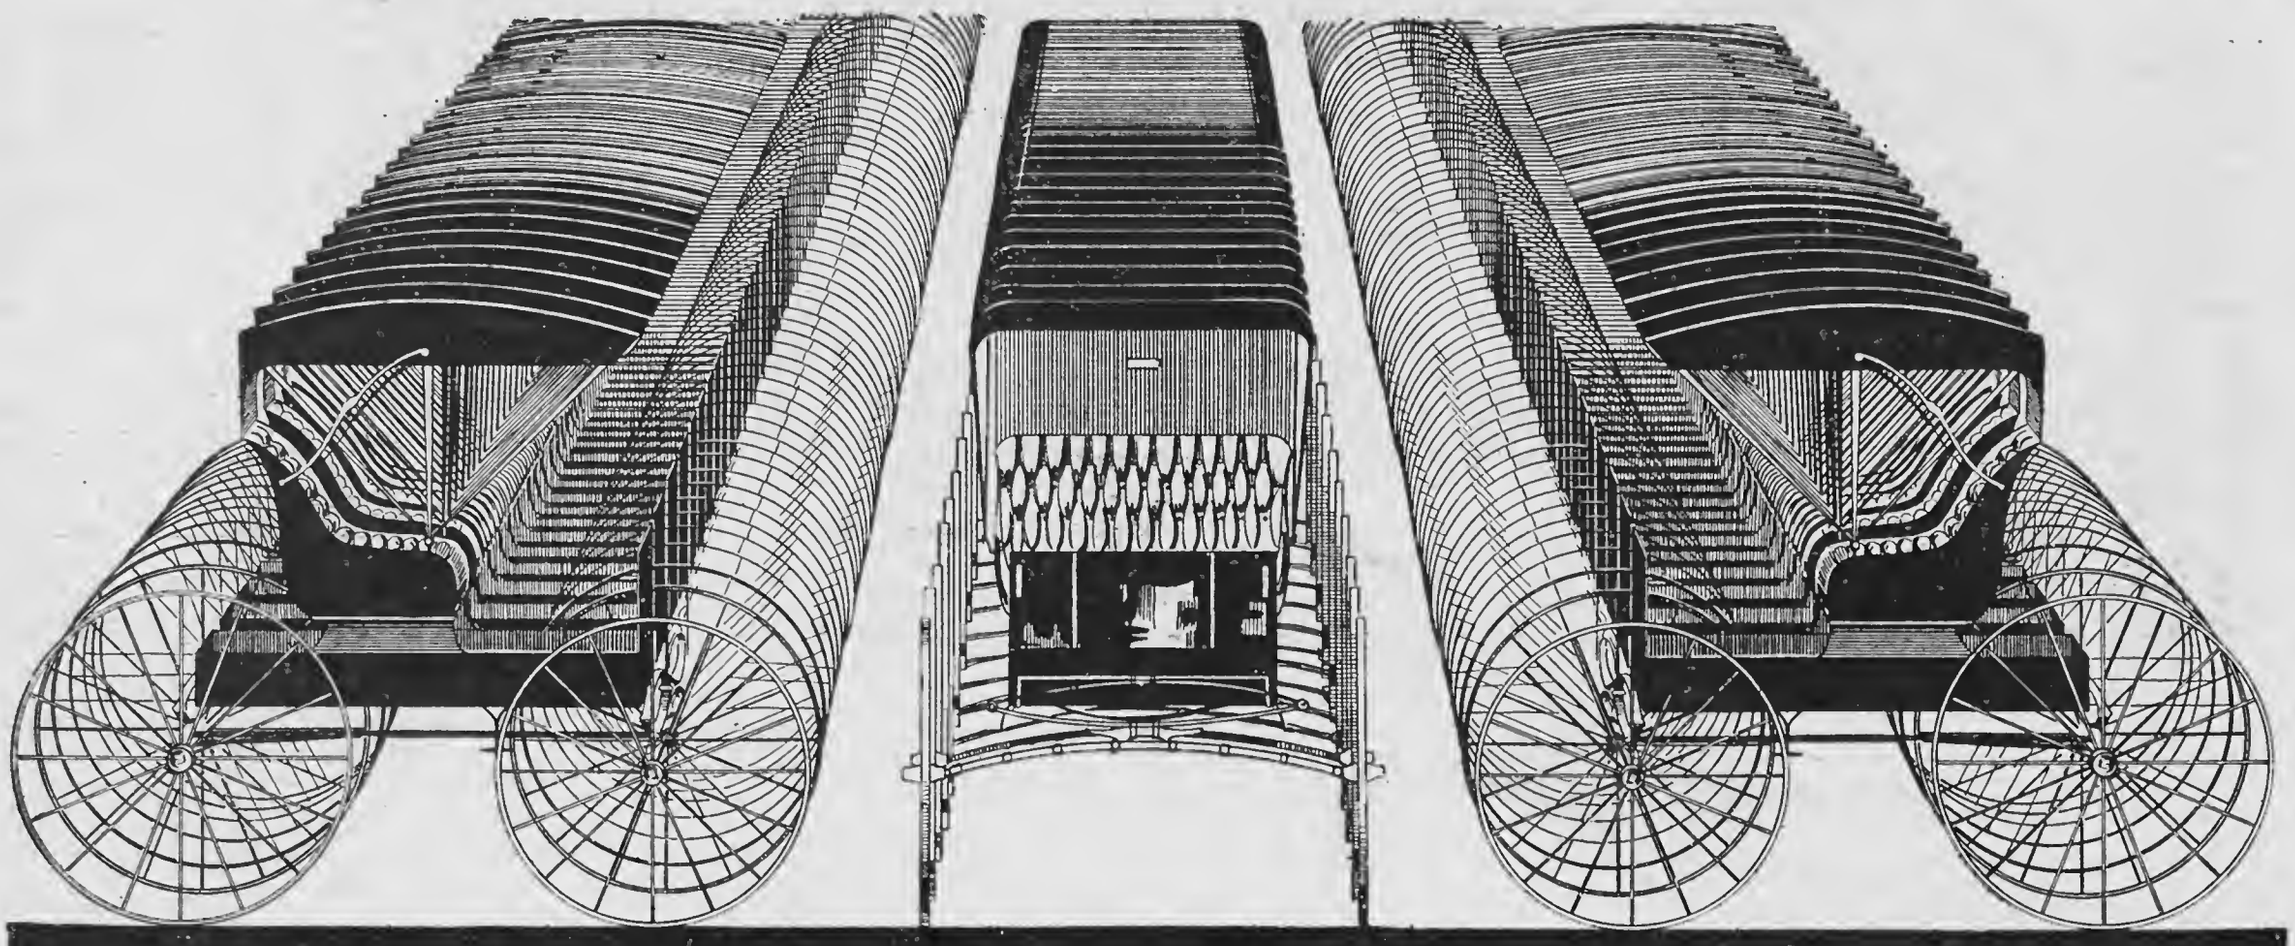
FOR SALE—230-acre farm; stock, tools; 10-room house, basement barn, 30 tieups; running water; sugar orchard; plenty wood, lumber and fruit; silo; sugar corn; ice and hen houses; school 5 minutes' walk; have wintered 25 cows, five horses; possession at once. ARTHUR ROBINSON, Bridgewater Corners, Vermont.

ONE of the finest old homestead farms in the State, beautifully located close to good town with high school, churches, stores and the best of society, and near trolley and railroad. 112 acres first class land with thirty acres Alfalfa, abundance of fruit and spring water. Magnificent brick mansion with stone pillars; good barns with new cement stables. A rare bargain at $100 per acre. J. H. FORT, Oneida, N. Y.



Want A Buggy?

Let Me Show You Bigger Bargains and Finer Buggies Than You Can Find In 40 Small-Town Carriage Shops Rolled Into One

LET me show you the immense array of superfine buggies—all splendid styles. Let me do this right away. All you need to do is to clip—fill out—and send in the coupon. That won't take 5 seconds. It will cost you merely a 2 cent stamp. And it *may* cost you $25.00 to $40.00 if you don't grasp this great chance to get posted on genuine, rock-bottom buggy *value!*

It makes no difference whether you want a buggy, surrey, runabout, carriage, phaeton, spring wagon or a set of harness—your duty to your pocketbook is to get this book—and *get posted!*

It makes no difference whether you're going to buy from me or anyone else—*get the book!*

Give yourself the treat of inspecting these 140 pages filled to the brim with 125 wonderful offers in the finest vehicles man can make—the most stylish, easiest running carriages money can buy.

This Book Will Tell You ALL

Let Me Save You $25.00 to $40.00

On The BUGGY You Buy! Nearly 200,000 Others will assure you that I can do this for you

Doubtless, scores who know *by actual experience* that I can save you that much hard cash *live right in your neighborhood!* Nearly 200,000 customers testify to that as fact. Nearly 200,000 men just like you know that I do save them the fat profits of the small-town dealer—whose buggy price must cover and include traveling men's expenses and salary, middleman's commission and carriage maker's profits. They got my book—and thus saved $25.00 to $40.00 on every buggy they bought. And you can do the same. And get

Split Hickory Vehicles

—the finest carriages that ever rolled over a road. Made of genuine Second Growth Hickory—*split*, not sawed. Constructed for service. Built for solid lasting *comfort.* Designed in the very latest 1914 styles. And *Guaranteed Absolutely For 2 Full Years!* And sent to you on an offer of **30 Days' FREE Trial On Your Own Roads!**

Nearly 200,000 men—farmers—merchants—horsemen—assure you that they have benefited by getting my book—and taking advantage of my plan. What they have done—you should do. Where they have profited—you will profit. And remember every Split Hickory Vehicle is

Sold On My Ironclad Guarantee For Two Years!

NOW—while you have a moment to spare—before you forget it—just clip off the coupon—fill it out with your name and address—and mail it to me. *GET THE BOOK!*

VOL. LXXIII. No. 4249. NEW YORK, APRIL 4, 1914. WEEKLY $1.00 PER YEAR.

TRAINING A SADDLE HORSE.

How It Is Done.

[On page 366 appeared the following request by B. D.:

"I have a little mare of native stock, but sired by a well-bred horse of the carriage type; she is coming five, trimly built, and weighs, in good condition, 950 pounds. She has just been broken to drive and shows a very pleasant disposition, with a fair amount of life and nerve. Having no use for her on the farm, and not wishing to dispose of her at the price such horses bring, I would like to make a saddle and driving pony of her, for my own pleasure and that of my wife. I have handled horses and colts, from my youth up, but know nothing about training a horse to the proper gaits under the saddle."]

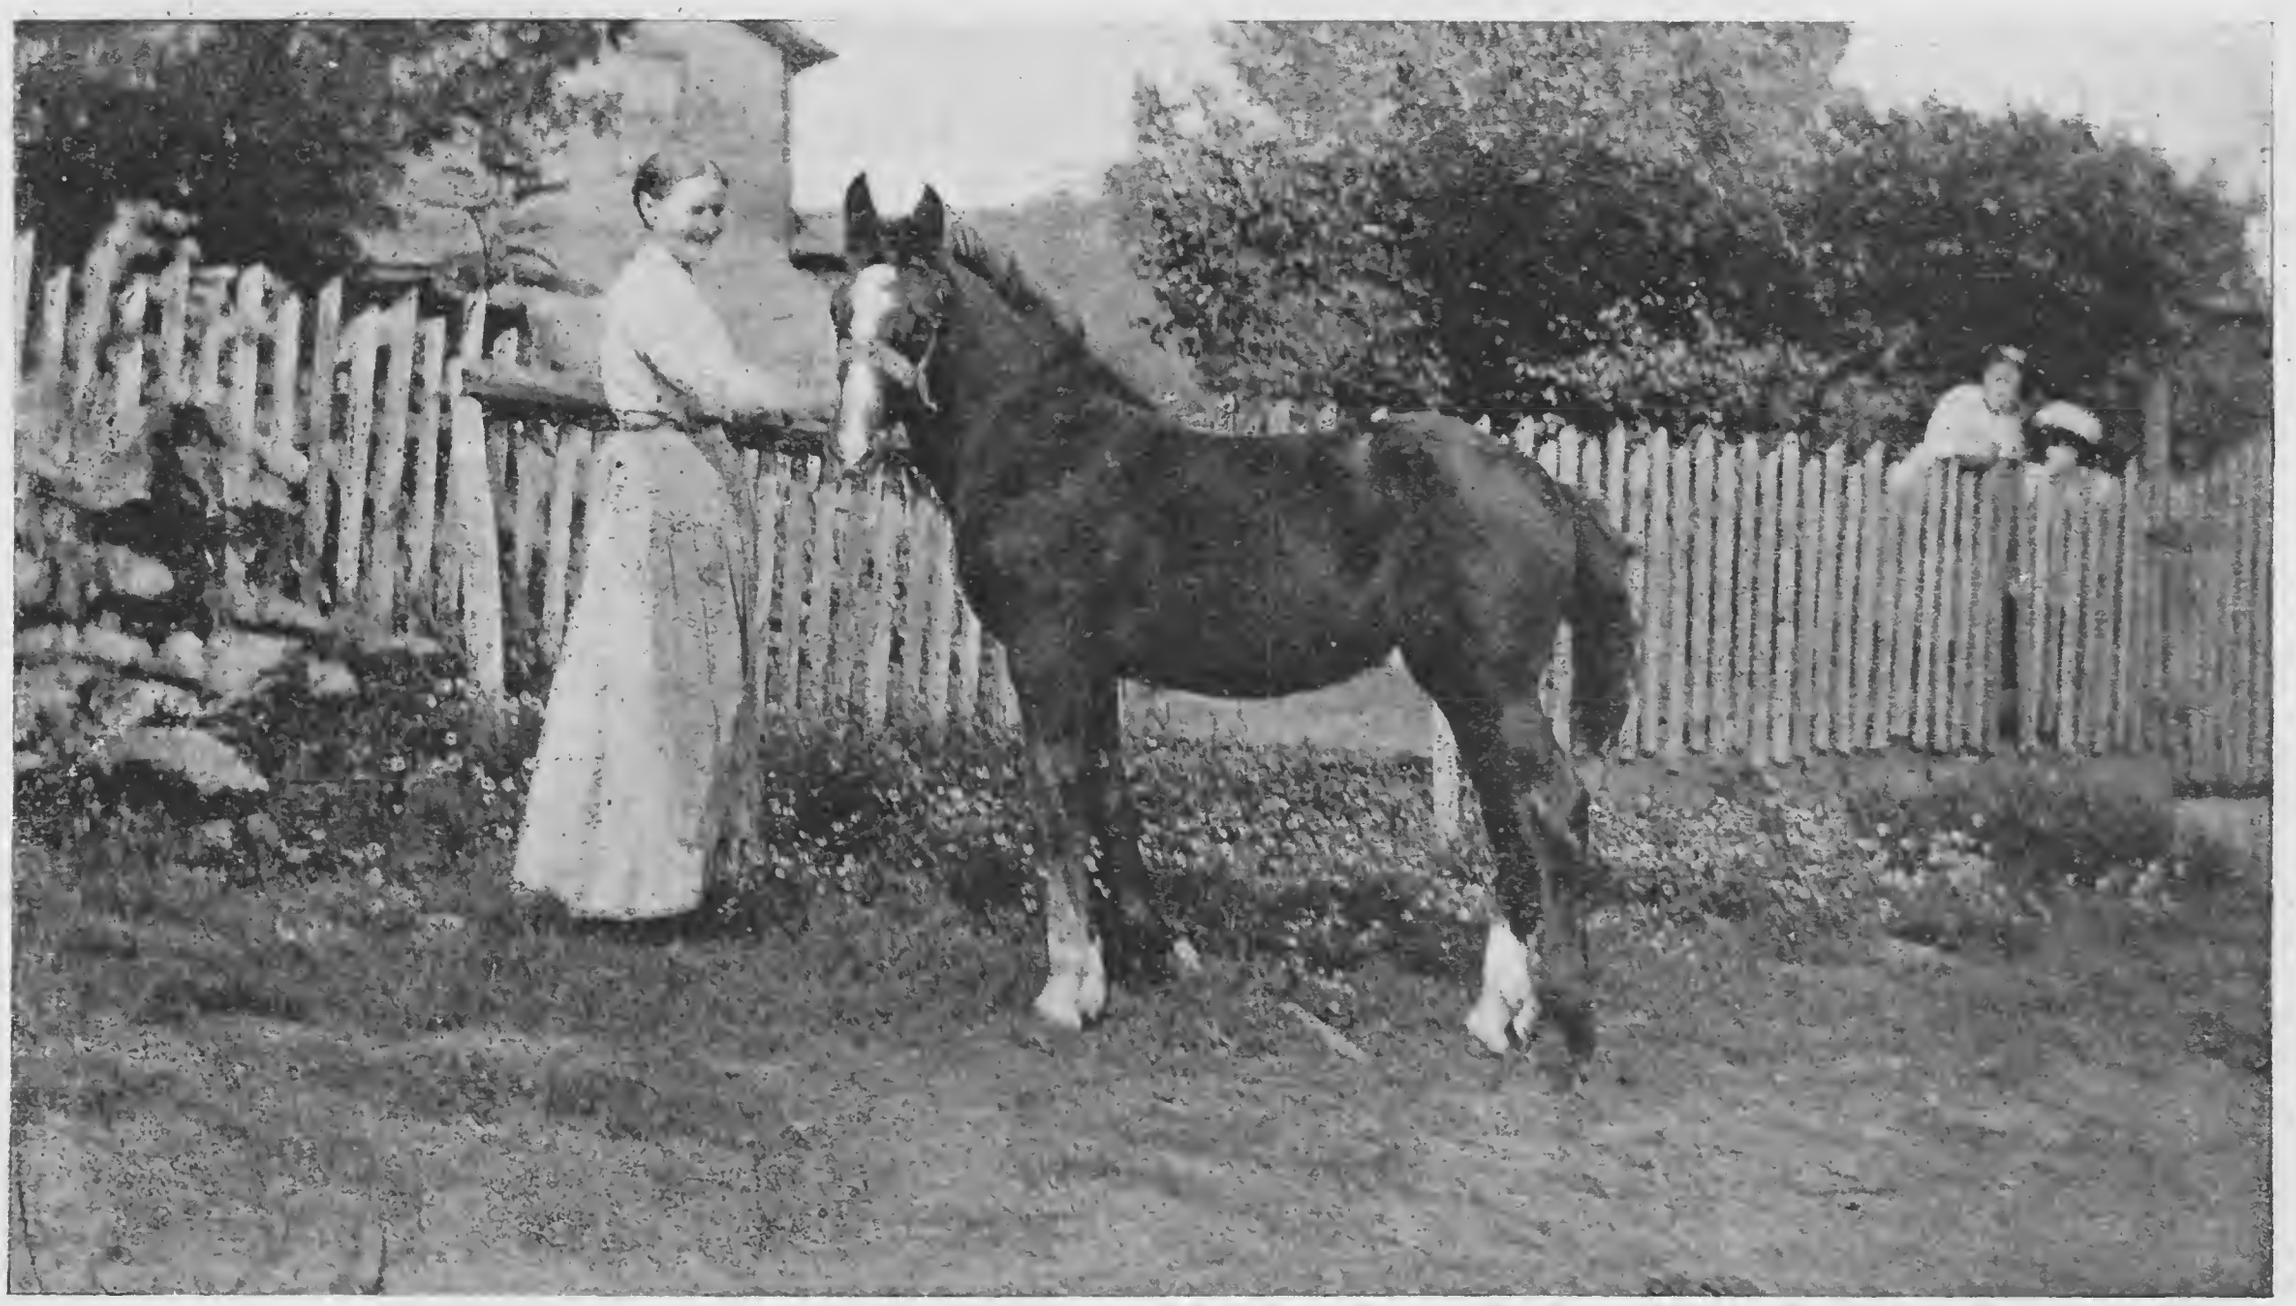
According to his description B. D. has a valuable animal. With a very little training she will make a useful animal. One great trouble in training such horses is that we are liable to ask too much of them. We try to teach them too much, and that all at once. It requires some skill and judgment to train a saddle horse. First the rider should know how to ride; unless he does he will not know what to expect from his mount. Next, much depends upon the equipment, the saddle and the bridle and their adjustment. It would take several pages to describe all these details. However, if B. D. is a natural horseman and a good rider he can soon have his mare broken to saddle, and that too without at all impairing her usefulness as a buggy animal. First then, do not let too many people manage her. Have an understanding with your wife as to what you expect of the horse and what you are trying to teach the animal. Use the same motions and the same words. Do not think of teaching several gaits. The practical gaits are the walk and the canter. Leave out the fancy gaits. A lazy slow walker is an abomination.

Get a good McClellan army saddle, your size, with good stout girths or cinches and a good broad folded blanket. Put it on carefully. Cinch it securely. Teach her to stand a good stout cinch. Teach the horse to stand for saddling. No fussing. Put on the blanket, smooth and without wrinkles, the broadest fold next the horse. No matter if the blanket looks big and clumsy. I would not use a "gag" bit, just a plain smooth-jointed bit that she can hold is better. In fact I like a straight easy bit for most horses; a single simple rein. Get her used to mounting. If she is a pet this mounting can be taught in the stall. Get her to understand that she must stand still until you are placed in the saddle (same as to the carriage). Have one word to stand: "Whoa." Have one word to go, "Get up" or the "chirrup." If she is highstrung do not fool her, but be ready when she is ready, but always use the word or signal.

Now make her walk. Do this without chafing or fretting her. Gradually teach her how to carry her head, not too high, not too low. Do not let her "hog the bit." It is all in how you hold your reins; a firm hold, a gentle hand, a flexible wrist, the reins crossed in the left hand, the light stiff whip in the right hand. Always carry the whip, she likes to watch it, and it keeps your hand occupied.

If she will walk let her walk. Going away from home is not the best time to teach the walk. Coming home is best, three miles and back first trip. Soon make it five miles. She will learn the walk best when somewhat wearied and on the way home. If she does not walk up "purty brisk," touch her with the heel or with the whip, just lightly. Sometimes in teaching the walk one has to "nag" her just a little, but always hold her to the walk. I think B. D. knows just how to do this. Always sit straight and square in the saddle in teaching the walk, no false motions, and use the word "walk." Also use the same word "walk" in driving lessons. After the first few lessons she will take pride in walking briskly. The walk is the best selling gait. A horse shows better under a walk anyway hooked up. So teach the walk first.

Now the canter. If the road is right and she wants to move out a little, lean slightly forward, press a trifle more down in the stirrup. Get the reins a trifle closer. Hold them a trifle higher. As you lean forward chirrup and touch very slightly with the whip. The whip is held pointing to the flank, close to the horse, and the butt of the whip points to the thumb. Never carry the whip high, or point forward. Never carry the reins way up in the air. I was very awkward when I first began to ride, and it would have been a difficult task had it not been for the instructions given me by an old cavalry officer. He said: "Keep your reins tight, but do not pull hard. Keep your toes pointed straight ahead. Always press the knees against the side of the horse. Do not carry the reins way up in the air. And above all things keep your elbows down by your side so that your forearms are horizontal. No horse can be made an easy rider if you let your arms or your legs flop." Do not try to put on any fancy English or park frills. Hold her head comfortably steady. Let her canter. Learn your seat. Learn your reins. Learn your horse's mouth. As in driving, she should draw a very little, about



A PENNSYLVANIA FARMER'S WIFE AND THE COLT WHICH WILL MAKE HER DRIVING HORSE. FIG. 211.

five pounds upon the bit, more when driving. Do not canter more than 10 or 20 rods at first, then back to the walk. Never tolerate the trot under saddle. Never tolerate the canter in harness. The word for canter and the word for trot, as well as the motions, should be different. I think B. D. knows all this already, but few others do.

Now about the stirrups. If you want a horse for your own use do not start out with short stirrup straps. Do not go after the English up and down daylight seat. Have the stirrups long enough so that the ball of your feet can just hold them comfortably. Let your feet rest in the stirrups and sit squarely down and back in the saddle. Let the wife handle and make love to the horse all she wants to, but do not let her ride until the animal is thoroughly broken. Then if your wife will use the same saddle you use and ride as you ride she will find horseback riding a pleasure. The plain western style, or old cavalry style of riding is the only practical style to my notion. I rode night and day for years, have broken many horses to ride, and I think the most useful horse is the one broken and ridden as I have suggested; not only that the horse used this way looks better (to my notion) under saddle and lasts longer. W.

PUNCHER AND TONGS.

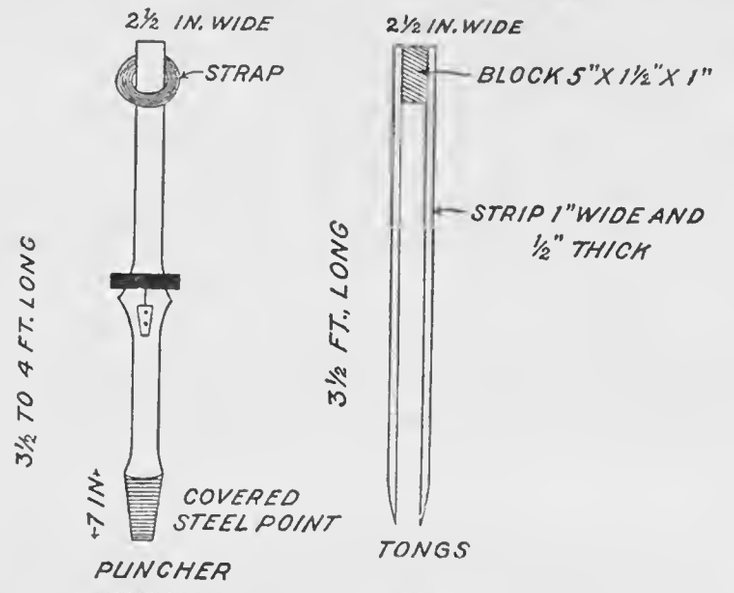
Two years ago for the benefit of the readers of The R. N.-Y. I described a tool, or rather a combination of two tools, used by truckers in South Jersey for setting sweet potato, cabbage, tomato, strawberry and other plants. In writing of these tools, which we call the puncher and tongs, I stated that a man with boy to drop plants could set 14,000 to 20,000 plants a day. Immediately a host of readers came right up claiming that the statement was untrue, but in the discussion that followed on rapid planting, I think most readers were convinced of its truthfulness. Because of this discussion, however, I fear many overlooked the description of the tools themselves. At any rate I have received many requests through The R. N.-Y. during the last two years, for directions on making and using the puncher and tongs; and many too have asked me to have them made for them. That I cannot do, and at the outset I wish to have it understood that I cannot go into the manufacturing business. These tools are not, so far as I am aware, for sale by any seedsman or dealers in agricultural implements. The ones I use were for the most part, made by myself, and I have no extra sets for sale. They are quite easy to make, anyone can make his own, and when once made will last a lifetime.

Practically all kinds of plants can be set successfully. Last year we set about 90,000 sweet potatoes, 25,000 strawberries, 8,000 cabbage and 4,000 tomato plants with these tools. The sweets were set on light sandy soil, and the cabbage, strawberries and tomatoes on heavier soil. The greatest speed can be made with sweet potato plants on light soil. Plants cannot be set so rapidly on heavy sticky soil, but even so the puncher and tongs is far ahead of a trowel for doing the work.

I do not know exactly how the puncher and tongs came into existence, but in this section hundreds of acres of sweet potatoes are grown annually, and as near as I can learn these tools have been slowly evolved by the growers themselves; who in order to increase their plantings found it absolutely necessary to have something that would make planting less laborious than if trowel were used, and at the same time be more rapid. They certainly have succeeded, or at any rate they think they have, for to-day practically all of the millions of sweet potatoes grown in this vicinity are set with the puncher and tongs.

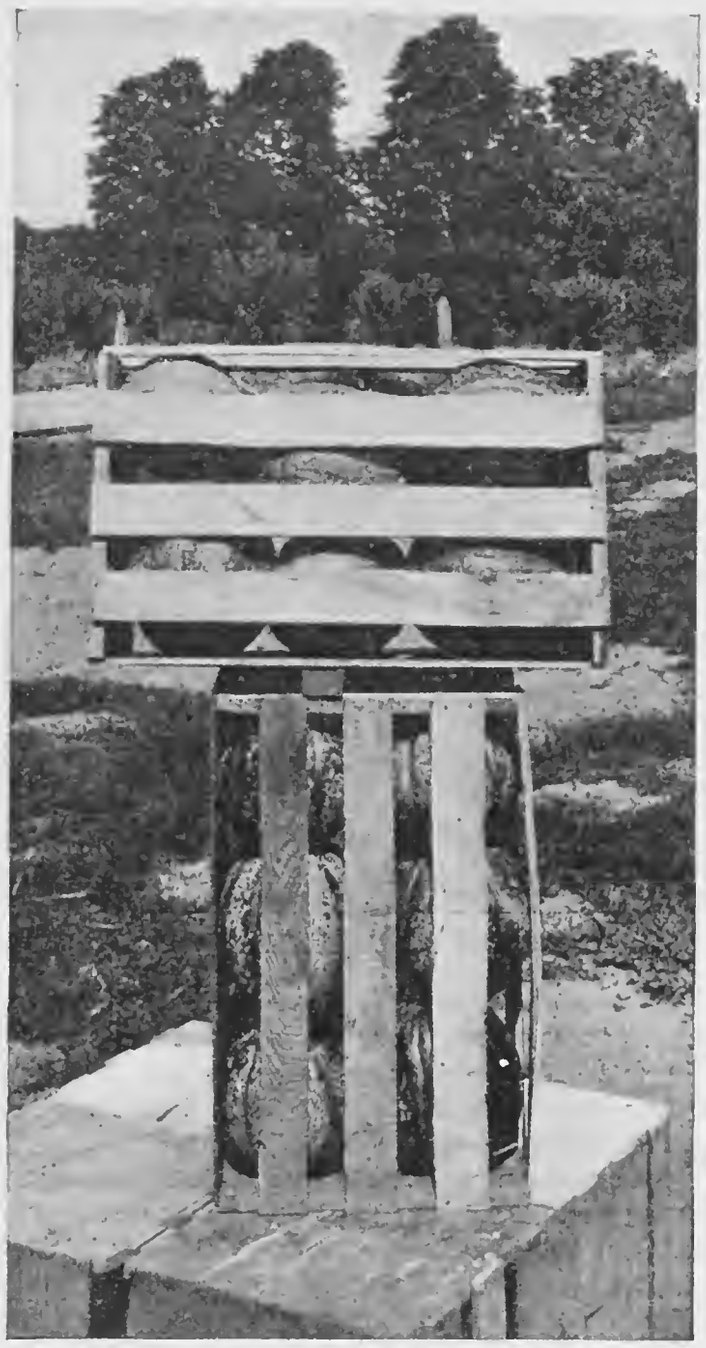
The puncher and tongs can be made as follows: Take a piece of white pine 3½ to four feet long, 2½ inches wide, 1¼ inch thick, and dress down for puncher as shown in the illustration, Fig. 212 For 25 or 50 cents a blacksmith will put on a steel point, or rather a steel covering for the wooden point, and also an iron strap to hold the handle in place. A cloth band for the arm is run through a slot in the top; for this an old suspender answers nicely. The tongs are simply two strips, each 3½ feet long, one inch wide and one-half inch thick, made to taper at the point and nailed to a 5x1½x1 inch block, which keeps them open at the points and gives some spring. Be careful to have the two strips come together squarely and tightly at the points. The length of both puncher and tongs should vary in accordance with the height of the operator. It will be quite easy for an inexperienced person to make both puncher and tongs, but his first attempt at using them will not be so easy. At first they seem very awkward and clumsy, and it is quite difficult to get a plant set at all. However, to do first *good* work and later *rapid* work requires much patience and practice, but after once getting the knack it is quite easy.

All operators do not handle these tools the same way, some prefer one, some another. The following is the way I like best myself. When setting plants walk with the row on your right. Have the right arm through the snug-fitting strap at the top of the puncher with the hand grasping the handle. Take the tongs in the left hand. First grasp the plant *at the very end of the root*, between the *points* of the tongs; insert the point of the puncher where the plant is to stand, and turn it part way around without withdrawing it; then with the tongs push the plant down beside the point of the puncher in the opening made by turning it, withdrawing the puncher as tongs are inserted. When the plant is in as deep as desired, release pressure on the tongs and remove them, striking immediately after with the puncher a short distance from the plant to pack the soil about the roots. In practice these movements follow each other in quick succession, and on clear ground plant setting goes almost like clockwork.



PUNCHER AND TONGS. Fig. 212.

A beginner will find catching the plant in the tongs the most difficult part of the operation, and emphasis should be laid on the necessity for doing it correctly. In practicing he should be careful always to pick up the plant by the end of the root, and have it between the two points of the tongs *clear down to their very end*. If a plant is grasped half way up the stem it will be doubled up when set and have both tops and roots in the air, and if caught an inch or so above the two points of the tongs it will be hard to get the plant set as deeply or as accurately as desired. Hence the necessity for having the tongs come together squarely at the points.



PACKING MELONS—WRONG WAY ABOVE, RIGHT WAY BELOW. Fig. 213.

As stated at the beginning of this article, a man with a boy to drop plants can set 14,000 to 20,000 plants in a day of 10 hours in the sandy soils, and he will not feel near as much like stretching himself across the ridges to get the "kinks" out of his back when night comes as does the man who sets plants all day with a trowel. TRUCKER, JR.

SPECIAL NEED OF PHOSPHORIC ACID.

As I have little stable manure, I am obliged to use liberal quantities of complete mixed goods, but have not been satisfied with the results. I have found that my soil seems to be especially deficient in phosphorus, and an additional amount of acid phosphate seemed to show greater results than any other single ingredient. But as my soil is also lacking in humus and all the other ingredients, and as I expect to spend my life on this farm, it occurred to me that perhaps I would get better permanent results from the use of bone meal. Last year I tried the raw bone meal, and the crop seemed to indicate more immediate results than I had been led to expect. Now, the question is, should I use both acid phosphate and bone meal in addition to other suitable elements, or perhaps in addition to a "complete" mixture, or would it be better, as I am situated, to use the bone alone as a source of phosphorus, and for such an amount of nitrogen as may become available the first season? In either case, would you suggest the amount of bone which I could profitably use, bearing in mind that I am not so anxious to make a large profit the first year or two, as I am to grow a large crop and at the same time be getting the land into condition to produce paying crops later on. Is there any danger of injuring the soil by the use of too much of the raw bone meal? Any suggestions will be gratefully received. S. S. C.

Hardwick, Vt.

We assume that you have tried lime and have learned that the trouble is not a lack of that element. Your soil may be sour or it may be too hard and compact for good culture. Active lime would partly remedy this, and to some extent make up for the lack of humus. We assume that you will increase the humus supply by plowing under cover crops. From choice in such a case we should use two-thirds of the phosphoric acid in the form of bone meal. About one-third in the form of acid phosphate will give available phosphoric acid for the immediate use of the crops. The remainder in the form of bone will become gradually available in the soil and prove a continuous source of supply, more reliable, we think, than an equal quantity of acid phosphate which has become "reverted" in the soil. We should plan to use clover, Soy beans or vetch as far as possible for cover crops as these supply nitrogen and will give vegetable matter which quickly changes to humus. Then use reasonable quantities of the complete fertilizer, and in addition for each acre 500 pounds of a mixture—one-third acid phosphate and two-thirds ground bone. Raw bone meal of good quantity will not injure your soil.

HARDINESS OF PEACHES.

[When people say that one variety of peach is "hardier" than another, just what do they mean?]

There are two kinds of hardiness in peaches—hardiness of bud and hardiness of wood. Fruit-growers often confuse the two. The peaches hardiest in wood are the small-growing varieties with compact heads, descendants of ancestors from Northern China, while the free-growing sorts with large heads and succulent wood, descendants of ancestors from Southern China, are tenderest in wood. In the first group are Hill Chili, Crosby, Gold Drop, Barnard, Triumph, Wager and Fitzgerald; among those most tender in wood are the two Crawfords, Chair Choice and Reeves Favorite.

The varieties most hardy in bud are those that have the thickest bud coverings and the most pubescence. Here again, the North China group of peaches are hardier in bud than those from South China, the varieties most hardy in bud being Crosby, Hill Chili, Triumph, Gold Drop and Stevens Rareripe, while the five most tender in bud are the two Crawfords, Chair Choice, Reeves Favorite and Elberta. A few years ago I sent several hundred circular letters to peach growers in Michigan and New York asking for information on this subject. The lists given above are made out from the answers I received. The consensus of opinion among the men to whom I wrote was that the peach must have a warm, well-drained soil to secure the greatest possible hardiness inherent to the species. Either extreme of moisture—excessive wetness or excessive dryness — gives favorable conditions for winter-killing. All were agreed that young trees suffer most from Winter freezes. So, too, there was a general agreement that peaches are more likely to suffer from cold if unthrifty than if thrifty. Most of these growers with whom I corresponded had found cover crops of material assistance in protecting the roots of the peach from cold and in causing the trees to ripen thoroughly. Nearly all growers prefer low-headed trees, claiming that both buds and branches are more often injured in high-headed trees. The testimony given was for most part unfavorable to wind-breaks.

Geneva Exp. Station. U. P. HEDRICK.

GROWING THE OSAGE MELON FOR PROFIT

PART II.

A deep cultivation is recommended for the first and second cultivation, and after that cultivation should be as shallow as possible. Muskmelons seem to delight in frequent working and hoeing, and as we are after the early melons, it is important that the vines be grown and rushed along to maturity as soon as possible. This is one of the important points in melon growing, as sometimes a difference of a week in marketing may mean $500 to $1,000 in profit where seven or eight acres are being grown. The sooner the melon can be grown and matured the sooner the cultivation can stop and the melon be ripened. If the melon can be grown fast in the first part of the season so as to reach its size, cultivation can cease and the soil will begin to dry out, which will have a tendency to ripen the melons earlier. In the picking and marketing of the melons care should be taken to handle them carefully and not bruise them, as it depends much upon the condition of the melon when it reaches the consumer whether he will want it or not.

The right and wrong way of packing is shown in Fig. 213. In the lower crate the melons are all laid one way and packed snug and tight so as not to shake and bruise in transit. In the upper crate some are laid one way and some another, giving a chance for shaking and bruising, and thus going to the market in bad condition. As I have no seed to sell I feel free to say a word in regard to seed. We have never trusted to the seed men for our Osage seed as few men can afford to save the best Osage melons to get seed from, but I have made it a practice for years to save our own seed from some of the earliest and best developed melons. Fig. 215 shows the type we desire for seed, a well-formed, shallow, even-ribbed melon, slightly netted and very thick-fleshed as shown in Fig. 185, page 475. It usually takes about two dozen of these melons to furnish one pound of seed, but we would be willing to pay $5 per pound for this seed, rather than $1 per pound for inferior seed.

Fig. 214 shows one day's picking, packed and ready for market. The boy shown in Fig. 216 is the junior member of the firm and is paid for picking every day he picks. Although but seven years of age, he has become expert in telling ripe melons. He is also an expert on the flavor of ripe melons, and it is surprising how much melon a small boy can hold.

Just a word on advertising. In my opinion the best way of advertising is to ship nothing that is inferior, and labeling the crate with the variety, stating where grown and by whom. If you have a really good article do not be afraid to waste a few crates by giving away to buyers, thereby letting them know what you have. This is one of the best ways of advertising (through a man's stomach) and it has enabled me to contract my crop for five years in succession to the same buyer before picking a melon. Melon growing, like other fruit, has its ups and downs, but taking it one year with another, if one has the soil, and can work up a market, growing melons with a flavor, putting them up in an attractive package, will prove a pleasant and profitable business.

H. B. BLANDFORD.

R. N.-Y.—Mr. Blandford's reference to flavor brings to mind the destructive and at the time of thrashing the separ- melon blight, which has made cantaloupe growing uncertain in many localities. Where blight exists, it is found that flavor deteriorates even before evidence of the disease is noticed on the foliage. There is little doubt that many poor melons that disappoint the consumer are from affected plants. But growers of superior stock in any intensive line are likely to find that they must select their own seed. This is true, too, in special florists' flowers.

ONE DAY'S PICKING OF OSAGE MELONS. FIG. 214.

TYPE OF MELONS DESIRED FOR SEED. FIG. 215.

A MELON FIELD AND A YOUNG PICKER. FIG. 216.

GROWING HAIRY VETCH FOR SEED.

At the present time little attention is paid to growing the seed of Hairy vetch as a commercial enterprise. It has been grown for seed in small quantities in Washington, Oregon, Michigan, Maryland, Ohio, Connecticut, and a few other Northern States, but the production has been inadequate to supply even the needs of the localities in which it was grown. Practically the entire supply of seed has been obtained from Russia and Germany, where it brings upon the wholesale market from three to seven cents a pound. During the last few years the annual import of Hairy vetch seed to the United States has been about 500,000 pounds. In America the seed varies in price from $4 to $9 per bushel of 60 pounds, so that under ordinary conditions seed production should be a profitable operation. There seems little likelihood that European seed will ever reach the farmer at a satisfactory price, and because of its hardiness and adaptability to varying soil and climatic conditions it can be, and should be, grown in nearly every State in the Union.

The methods of handling the seed crop vary; due partly to difference of opinion as to the best method, but more largely to the machinery which the grower has on hand. The planting of vetch for seed production should always be thinner than for hay and forage purposes. Generally in Europe the seed is sown with a grain drill or thrown broadcast on the rougher areas. It may be sown by itself, but often small quantities of oats or barley are used to give support to the growing vetch plant, and at the time of threshing the separation is accomplished by a fanning mill. Occasionally fields are planted in rows and cultivated. This seems experimentally to be the best method, but commercially it must be estimated if the increased yield resulting will offset the additional cost of cultivation. If the row method is to be used, the seeds are drilled in rows one to 1½ foot apart, and cultivation is practised as long as the plants will permit. Twenty to 30 pounds of seed per acre is the best rate of seeding according to tests made in Washington and Oregon, but more is required if the seed is to be sown broadcast.

In general practise the time of gathering should be whenever the bottom pods have become dry and are ready to burst. The vetch ripens its seed unevenly, but at this time there is the greatest per cent of mature seed on the plant. Later cutting occasions more shattering of the seed; while earlier cutting results in a considerable percentage of immature seed. In some localities where but little seed is raised, an ordinary mower is used to harvest the crop. The vetch is rolled back from the uncut area so that the machine will not break open the seed pods when cutting the next swath. Care must be taken, as the pods are very easily shattered. Sometimes the first swath cut is rolled over the uncut vetch, and when the succeeding swath is cut the two are rolled back out of the way. Thus by putting the vetch in larger swaths the loss from shattering is reduced.

If the growth of seed is to be undertaken for commercial purposes it is essential to have more adequate machinery. An ordinary grain binder can be used when the vetch is erect, and when thus harvested, the crop is put in shocks and allowed to remain there until thrashed. The important rule in growing vetch seed is to handle the crop rapidly and as little as possible to prevent loss by shattering.

When vetch is put through an ordinary thrashing machine there is danger of splitting the seeds. In order to reduce this cracking of the seeds to a minimum it is best to remove most of the concave teeth. The expense of thrashing is higher than might be imagined, usually from 18 to 25 cents per bushel. This is due to the fact that vetch thrashes very slowly. Under favorable conditions 10 to 12 bushels to the acre have been obtained, but as a rule only five or six may be expected. Before storing away in a cool, dry, well-ventilated loft, it is advisable to run the seed through a fanning mill. Besides removing any oats or barley present, this will eliminate many noxious weed seeds. Old seed germinates poorly, and if kept more than two years after growth it deteriorates rapidly. Many growers have already considered the production of Hairy vetch seed for their own home use. Undoubtedly it will not be long before this field is widened, and gradually cheaper American grown seed will replace the more costly imported stock of to-day.

THERE was a rhubarb show in London on February 28. It is said that nine-tenths of the world's supply of forced rhubarb is grown near Leeds, England.

FARMERS' CLUB

[Every query must be accompanied by tho name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Labels for a Large Orchard.

[There has been considerable inquiry about the best method of marking the trees in a large orchard. What is the best label? Where orchards are planted in large blocks it is not necessary to mark each tree. A good map of the orchard can be used for identification. In California growers are adopting the plan of painting numbers on each tree. This, with a map, answers the purpose. Others use flat wooden stakes with the variety name painted on. Most metal labels are of aluminum. On a large scale the machine described as follows can be used.]

The labels that we have found most satisfactory are those printed on aluminum tape by means of a labeling machine. This machine prints the letters in an embossed form so that they are not obliterated by any kind of spraying materials, which is frequently the case in many other kinds of labels. The labels themselves are loosely tacked to the trunk or on some of the larger limbs by means of brass escutcheon pins, about No. 16, 1½ to two inches long. These pins are simply driven into the wood far enough to hold the labels, thus enabling the label to be pushed out along the pins with the growth of the limb. The chief difficulty with this method is the relatively high cost of the labeling machine. This machine, at present, costs about $75, and it prints letters three-eighths inch high on seven-eighths inch aluminum tape. This tape can be bought at 70 cents a pound in 10-roll lots, which weigh about 14 pounds. Unless one's orchard interests are fairly large, therefore, he can hardly afford one of these machines by himself, and the alternative would be to secure one in the neighborhood through coöperation. Another plan would be to submit the legends desired on labels to some one who has one of these machines, or possibly to the manufacturers themselves, and have the labels printed by them as desired, merely at the cost of materials and labor involved, provided one can get them to do it. Any labeling scheme, however, should be accompanied by a satisfactory chart of the orchard upon which the records desired are placed. The painting method, which involves the painting of the desired information or numbers directly on the tree frequently does fairly well, especially if it is watched and renewed sufficiently often. Wherever lime-sulphur is used for scale, however, this scheme is less desirable, because heavy applications of lime-sulphur are likely to obscure or completely obliterate the paint. J. P. STEWART.

Penn. State College.

Grafting Black Walnut.

I have a Black walnut about three years old which I desire to graft to English walnut. Can I get a bearing tree sooner in this way, or by getting an English walnut tree grown from seed. When is the best time to do the grafting and the best method? I can get grafts from a bearing English walnut tree nearby.

Smyrna, Del. W. L. M.

The Black walnut can be grafted with the Persian walnut, and that is the proper thing to do if he wants to grow this nut. All the California growers, and the eastern as well, are using the Black walnut as a stock for the Persian in preference to growing it on its own roots. It is said to make a healthier and stronger tree. Of course a grafted tree is likely to bear much sooner than a seedling, the same as with fruit, like the apple. Moreover, from a grafted tree one knows what to expect in the way of tree and fruit characteristics.

The time to graft the Persian walnut is after the leaves have begun to push out, and are perhaps one-third grown. The method is by cleft-grafting, using very heavy, sappy wood, up to an inch in diameter and from one to several years old. One-year wood is often so light and pithy as to be absolutely useless. This grafting of nut trees is difficult to attain success with at first, but experienced grafters get excellent results. The methods must be studied from the published bulletins, with illustrations, such as Bulletin 254 of the Bureau of Plant Industry, U. S. Department of Agriculture, "The Persian Walnut Industry in the United States." If W. L. M. knows of a bearing Persian walnut tree he should have its characteristics studied by the Division of Pomology of the Bureau of Plant Industry at Washington, or some other competent authority. It is of the highest importance that all these trees should be recorded and studied.

W. C. D.

Grafting Walnuts in Pennsylvania.

Could English walnuts be grafted on young natural walnuts on branches about one inch in diameter? Would it do to use scions cut from trees direct from nursery? Is grafting done anything like grafting apples? Would they do well in Northern Lawrence Co., Pa.?

New Wilmington, Pa. J. H. J.

The Persian walnut can be grafted as he proposes but it needs skill and practice and special knowledge of conditions that it is not easy to convey in a brief reference. If J. H. J. will send to the Superintendent of Documents, Department of Agriculture, Washington, D. C., for Bulletin 254, Bureau of Plant Industry, "The Persian Walnut Industry in the United States," he will be able to get the neccessary information and cuts of the various steps in the operation. Another good bulletin is Bulletin 1, Walnut Experiment Station. McMinnville, Oregon. An even better way would be to visit the nut nurseries in Lancaster, Pa., during the grafting season and see how it is done there.

Scions cut from trees direct from nursery could be used if the buds had not started and if the scions were plump and sappy. It is not generally known, perhaps, that wood two years old or older, and as big as can be cut for grafting, will succeed where the light and pithy one-year-old wood will fail. Northern Lawrence County, Pa., ought to be good for the Persian walnut. There are some good trees farther north near Lake Erie.

W. C. DEMING.

Lime Ahead of Potatoes.

Will it be all right to plant potatoes on ground where I had corn last year, which I limed with ground limestone at the rate of 1,000 pounds per acre, after the corn was cut? I sowed to rye, which I plow under this Spring; have done this for two years without lime and had good crops, but think our land can stand some lime. Would it be better to put the lime on after the potatoes, before seeding either with oats or rye? E. T. M.

Troy, N. Y.

We do not think the application of ground limestone last year will affect the potatoes injuriously. The ground limestone does not have an active effect, and the rye which you are to plow in before the potatoes are planted would largely overcome the effect of the lime. On general principles it is better to use the lime in a rotation after the potatoes, and not directly ahead of them.

BRIGGS: "Rogers claims to be an agnostic, doesn't he?" Griggs: "Only as to religion; as to everything else he knows it all."—Boston Transcript.

Plant Apple Trees That Bring Profits

Apple trees, like people, are happiest when in the right location. Most kinds grow well in New York and New England, but tests show that

BALDWIN :: McINTOSH :: SPY
STAYMAN :: :: R. I. GREENING
YELLOW TRANSPARENT :: GANO

are money makers in that territory. Plant the kinds that pay best.

Harrisons' Trees are budded from bearing orchards. They are true to variety.

We sell only trees we grow. Every tree we ship is clean, straight, healthy.

Get our 1914 Catalogue. All about trees for all sections. Fruit, ornamentals, shrubs, roses.

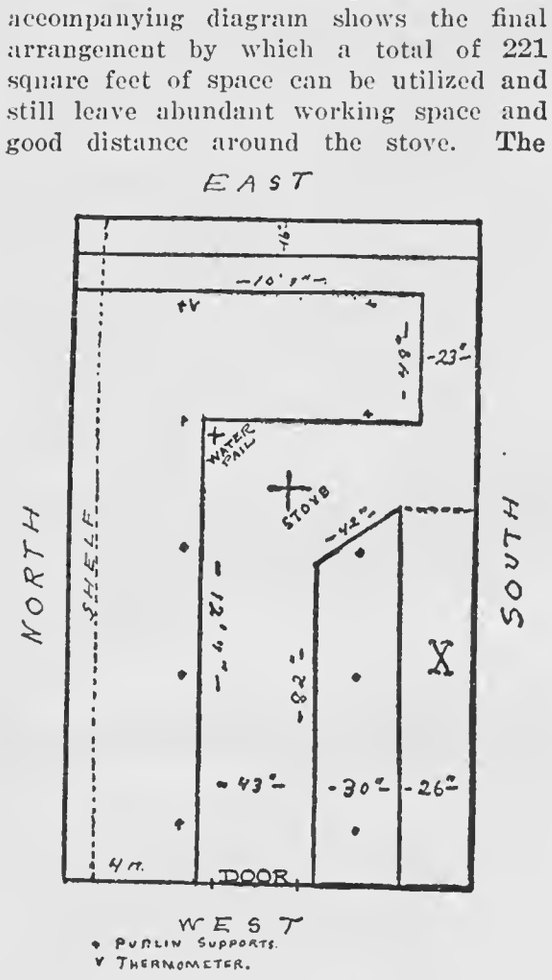
The Home Acre.

A HANDY GREENHOUSE.

Some good greenhouse plans have been given in these pages and I will therefore omit any detailed description of construction. The diagram herewith is a surface view at top of bench level.

This house is 12x20, side walls of wood four feet high. The top lumber, such as sash bars, purlin strips and ridge, also two ventilators, were purchased from a firm making a specialty of greenhouses. Lumber for the sides was purchased locally, and the bench lumber was pick-up stuff on the place. The entire cost of material including 14-inch heating stove was under $100. I did much drawing and planning for the bench arrangement and shelves to obtain a maximum amount of usable space with right light and temperature. The accompanying diagram shows the final arrangement by which a total of 221 square feet of space can be utilized and still leave abundant working space and good distance around the stove. The



SURFACE VIEW OF GREENHOUSE.

bench space proper gives 127 square feet. The space marked X is left open and filled level with the bench with potting soil. This is the best location for it, as the space is always in the shade—south side. However, boards can be laid over this space and utilized for germinating seed boxes or plants that can stand shade, like ferns. Around the sides and eight inches below the glass can be run a one-foot-wide shelf, with the exception of the walk on south side. Also through the center along the purlin supports can be run other one-foot shelves. This gives a total, as above, of 221 square feet. Still more can be obtained by adding a second shelf on the sides, to be used only for storage of boxes of germinating seeds. The space under the north bench may be used for cool plants like geraniums, cabbage, parsley, etc., as the sun strikes the floor under this bench clear to the wall. Under the other benches rhubarb may be forced from the first of the year till the outdoor crop is ready.

The writer has this greenhouse electric lighted and an extension phone from the house is installed. The stove is of the hot blast type, 14 inches in diameter. I now consider this too small, as there is sufficient radiating surface. With the present stove it is necessary to attend to it once during nights where the outside temperature is 25 or below. White ash nut soft coal is used in combination with nut hard coal, not mixed, but placed in the stove in alternate layers.

At the point marked V is kept an accurate thermometer about eight inches above the bed. A night temperature of 50 to 55 is maintained as closely as possible, with five degrees higher on cloudy days and 15 on clear days. This proves suitable for most bedding plants. Plants requiring higher temperature can be placed on the center shelves or closer to the stove. Peppers and tomato plants would be among these. Such a house as this, with a stove for heat, cannot help but be dusty. A good hand spray pump is used and plants sprayed twice or more weekly on clear mornings and the floor sprayed daily. Thick-leaved plants are sometimes washed by hand.

The ventilators are one at each end and on opposite sides. One or both are open on all clear days. The opening device is a two-foot stick with spikes driven in at intervals. This allows the ventilator to be held open at any desired distance by resting the spike on the roof while the end of the stick supports the ventilator. The fuel costs this Winter is averaging very close to one cent an hour, but it is worth it. P. L. W.

Michigan.

Fodder Crops for One Acre.

Can you suggest a crop that will yield enough hay to last two cows and one horse for one year on one acre of ground in the same year? W. G. R.

Long Island.

It is doubtful whether you can do this on light Long Island soil. We should make a trial of the following: Plow your ground early and give it thorough preparation. Use either a heavy dressing of stable manure, or a large quantity of chemical fertilizer. On half the acre sow as early as the weather will permit, fodder corn in drills 2½ feet apart. Sow this corn thickly, at least one bushel of seed to the half acre. Use a large-stalked corn, and give thorough culture. At the last cultivation in August sow on this half acre one pound of Cow-horn turnip seed, and one-half bushel each of rye and barley. Put this seed right in the corn, and work in with your cultivator. On the other half acre sow as early as possible Canada peas and oats, as we have so frequently advised. When this crop is ripe, probably in early July, cut it for hay, break up the soil at once, and seed to Japanese millet. Cut this for hay in early September, break up the ground again, and seed to one bushel each of barley and rye. On a narrow strip at one side of the field run a few rows of mangels or cattle beets, the rows 18 inches apart. You can, if you like, sow the seed on a small separate patch, and transplant the mangel plants after the oats and peas come off, or cut a strip of this crop while green for the purpose. You can cut the barley for a light crop in early November. The Cow-horn turnips if properly fed will provide much feed for the cows.

Garden Peas.

What is an average crop per acre of garden peas? What size crate is used, and what price is the pickers supposed to get? About what do they bring on the market? I intend to grow the Prosperity pea. J. A. G.

Pangburn, Ark.

The growing of peas for market is dependent upon so many conditions, mostly of purely a local nature, it is impossible to forecast anywhere near accurately the size of the crop or the price per bushel they will bring in the market at any given place or time. Under normal weather conditions, with proper fertilizing and cultivation, the yield may run anywhere from 100 bushels and up per acre. The price here in New Jersey has ranged from $2 per 28-quart basket for this first picking or two, down to as low as $1, and in some instances even less, when there was a plentiful supply in the market. When they are sold by the bushel, in the city market, they may be shipped in the ordinary bushel basket or crate. The 16-quart peach basket will answer very well, for delivery to the local market. The prices usually paid for picking is about 25 cents per bushel. The Prosperity pea is without doubt one of the finest early peas grown, and always commands a good price in the market. If you intend growing peas for market in considerable quantity, I would advise you also to plant the late Gradus or Prosperity and Telephone. The late Gradus comes in between the last of the early Gradus and the Telephone, thus lengthening the season to a considerable extent, and without any break in the pickings.

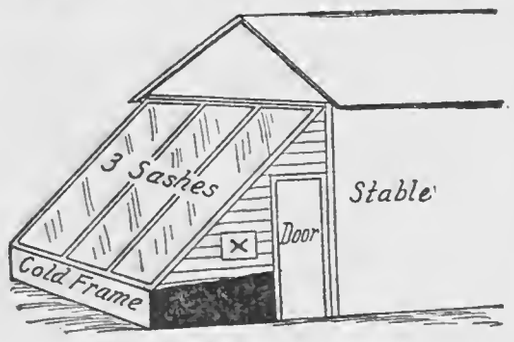
Ventilating a Greenhouse.

Is the ventilation afforded by two windows, as sketched, satisfactory, one at each end? I have a cold frame, leans against south end of horse stable, as shown. W. W. T.

Litchfield, Conn.

The method of ventilation suggested will not prove satisfactory, as it will be impossible to regulate the temperature by such an arrangement. The ventilators should be so arranged that the cold air cannot come in direct contact with the young and tender plants, for it is no more desirable for young plants to be exposed to sudden draughts of chilling air than it would be for young chickens or any other young live stock, and should be avoided as much as possible. This undesirable feature cannot be avoided with such a system of ventilating. Bottom ventilators are a fine arrangement for use in the warm days of late Spring and Summer, when operated in conjunction with top ventilators, as they greatly assist in keeping the house cool, but cannot be brought into use in the cool days of Spring without danger of doing more or less injury to the young and tender plants.

The ventilating shuold be done at the highest point in the house, as the heated air always rises to the top. The top ventilators when opened will not only permit it to escape, but will at the same time admit cool air to enter, which will,



VENTILATING FRAME.

on account of its being heavier, find its way to the lower parts of the house, but before coming in contact with the plants, it has been tempered so that it will reach them in a condition to be of the greatest possible benefit. If sashes are used for overhead, they should rest on rafters with seven-eighths guide between them and fitted loose enough to admit of the sliding up and down the rafters without bindings; a hook and eye on each side will hold them in position when closed, and if a few eyes are screwed into the rafters at intervals of two or three inches the sash may easily be lowered and held in position by the hooks, at any point that will admit of the desired amount of cool air necessary to regulate the temperature. If stationary sash bars are used, then provision should be made for hinged ventilators at the top, that may be easily raised and lowered. These can be held in position at any desired height, by the use of a piece of two-inch lath in which notches have been cut at intervals of three or four inches. Newspapers spread lightly over the plants will give much better protection against frost than muslin, are much handier to apply and remove, and are also less expensive. No covering of light material is an absolute protection when the outside temperature goes much below the freezing point. At such times some inside heat will be needed, and for a structure the size of yours, a small oak heating stove set in the center of the house will eliminate all danger from frost. K.

Building an Apple House.

I built an apple house, in 1911, two stories 24x36, 20 feet high to eaves. The lower story is a concrete wall 20 inches wide, 10 feet high; on this is framework. Sills 8x8; posts 8x8; plate 4x6; trimmer 10x14, 36 feet long, to take the upper floor timbers, floor timbers 3x8, 18 inches from center to center; floor one inch spruce, used 3x4 studding. The outside was sheathed, papered and sided, the inside papered, sheathed with matched pine, an inch wall strip put on, and ceiled again making two air spaces. Ceiled over head with matched pine; between the ceiling timber over head, which are 2x8, it is filled in with buckwheat shucks. The roof is slate. There is but one door for each floor; that should be a double door, each door made of two thicknesses matched lumber; one good-sized glass window for sorting that should have closed fitting shutters both inside and out. We have two trap-doors in upper floor for ventilation and hoisting barrels. Our building is set in a hillside, front facing north. I do not think you will want steam pipes in an apple house if it is properly built. You need a thermometer, below 32 set a little oil stove in for six or eight hours. If I were going to build again I would put a chimney in so as to use a wood stove if it was required. They freeze in the upper story so we get them out of there by Christmas. Our building holds 1,400 barrels. J. A. V.

Ravena, N. Y.

Cabbage Maggots.

I have a small bit of land upon which I grow vegetables, etc., for my own use. The land is sandy; a small quantity of manure has been applied every year for the past five years, and I consider it in good condition physically. There has not been a year in that time but what the roots of my young cabbage and cauliflower plants, turnips and parsnips have been attacked by maggots, and in some instances the roots eaten entirely. All other vegetables are not affected by these pests, and thrived abundantly. Can you explain why this occurs with the few mentioned? A. T. N.

Oakville, Ont.

The fly or mature insect of the cabbage maggot is said to have been imported from Europe about 1855 or 1856. Since then it has spread to almost every part of the North American continent where the cabbage or any of its related species are extensively grown. It is not only one of the most destructive insect enemies of the cabbage family, but the most difficult of control, on account of its attacking the roots of the plants. Its presence is never known, nor even suspected, until the plant begins to wilt, when in most cases it is beyond saving. Soils that are manured with stable manure or composted organic matter are very susceptible to infestation, as decaying organic matter of every description seems to be a favorite breeding ground for the insect, or a favorite place for the perfecting of the mature fly, and in the fertilizing of cabbage soils, it is well to use only commercial fertilizers as they are more or less of a deterrent, and crops fertilized with them alone are not so apt to be attacked by the maggot. For many years there was no known remedy for this insect, but the following methods of control are now being employed with some measure of success, but are not altogether practical to use on large plantations, on account of the great expense for labor in the application of them.

When this wilting of the plant is first noticed, a half teaspoonful of bisulphide of carbon, poured into a hole made near the root of the plant with a sharp stick, and immediately covered with damp soil, will, it is claimed, kill the maggots, and if the root is not entirely destroyed, the plant will recover and mature a good head. If the plant is beyond recovery, substitute another, which is not likely to be attacked. Carbolic acid emulsion is also recommended, which may be prepared in the following manner: Add to one pound of soap boiled in one gallon of water, one-half gallon of crude carbolic acid, dilute the whole with 40-50 parts of water. Apply to stalks of affected plants. In sections where the maggot is known to exist it is better to use the emulsion two or three days after setting the plants out, and repeat every two days until the plants outgrow danger of attack. K.

Worm Killers.

Where earthworms are very plentiful in lawns or gardens they often become a nuisance, their casts being disfiguring to closely clipped grass. The following liquids are recommended by the Florists' Exchange:

"Lime water can be made by mixing one pound of quicklime to a gallon of water. Allow it to stand two or three days until clear, then strain off the clear liquid and water well with the same. Corrosive sublimate at the rate of one ounce to 20 gallons of water will destroy the worms, but as some may be embedded in the tissue of diseased plants all may not be destroyed. The worm-killer made under Prof. A. D. Hall's advice is composed of the following: Mercuric perchloride, 10 pounds; hydrochloric acid four pounds; water, six pounds. To dilute for use add one-half ounce fluid to three gallons of water. The solution of corrosive sublimate or the worm-killer should be used when the soil is moist.

DIBBLE'S SEED OATS

Northern Grown :: :: Thoroughly Recleaned

DIBBLE'S NEW HEAVYWEIGHT

Early, with stiff straw and enormously productive Heavy grain with thin hulls. A Connecticut customer says: "Grain weighs 44 to 46 lbs." One from Vermont: "Over 117 bushels per acre." Ohio reports "Heavyweight yielded just twice the amount of other kinds." Only 2000 bushels left.

There's a SECRET at the Arrow Point

Thousands of Up-To-Date Fruit Growers are saying, "FRIEND NOZZLES ARE SUPERIOR." Why is this?

SIMPLY because they GET THERE. An IMITATION indicates that somewhere there is an ORIGINAL. Look on the NOZZLE you use and see if you can find the MAKER'S NAME and the word "PATENTED". The "FRIEND" is the ORIGINAL large Nozzle doing away with the cluster. "FRIEND" Nozzles have no HORNS, no HOOKS, nothing to catch, drip or clog. They make the finest MIST-LIKE Spray, driving it farther into the trees than the cluster.

The "ANGLE" sprays up under the leaves and down into the CALYX. The "REGULAR" is for ordinary work. State which is wanted. Satisfaction guaranteed or money refunded. Price, $1.00 each, postpaid

Farm Management.

Conducting a Pea Cannery.

What does it cost to equip and conduct a good-sized modern pea cannery?

It reqnires a capital of from $100,000 to $150,000 to equip and conduct a modern pea cannery, as the enterprise must compete with well-organized and favorably located plants, long established and having a recognized good will. A favorable location will be understood to cover questions of proper soil, climate, altitude, drainage, water supply and transportation, both rail and highway. In addition there must be easily accessible a supply of labor that can be relied on for a period of six weeks in mid-Summer. It will be apparent that the above considerations limit pea canning operations to relatively few localities, and nobody should undertake the business without reliable expert advice.

Will peas put into silage make as good cow feed as corn silage?

Pea silage is much better cow feed than corn silage. This has been the experience of many farmers located near Cazenovia. They are beginning to learn of its value and the demand for it is increasing each year.

How many tons per acre of peas for silage would be a fair yield?

Four tons of peas and vines per acre would be a good yield. H. B.

Believes in Manure Spreaders.

On page 225 H. H. asks for a discussion of implements necessary for a small farm of 40 to 60 acres. Just what tool or implement one should use depends on the team to be used and the character of the soil to be tilled. For a two or three-horse farm I would suggest that H. H. does not need a gang plow at all, which he seems to favor. But he should have a medium-sized sulky plow or a good-sized two-horse plow and a one-horse plow. I do not advise the use of a small plow for breaking purposes, for I practice deep and thorough tillage, and so on my Maryland farm a one-horse plow does but a very small part of the farm work, but there are some jobs from time to time in the doing of which no other tool can take its place. There are several styles of harrows on the market, but if I were restricted to its use of but one kind, I would choose a big section spike-tooth drag or smoothing harrow. Before the introduction of the disk harrow farms were tilled and crops were raised, it is true, but I wonder now how it was done. And so in progressive agriculture a disk harrow is now necessary on every well equipped farm. Then there is the plank drag, the roller, and the weeder. Of course a mower and rake are indispensable on every farm where hay is made. If corn and small grain are to be grown, as they should be wherever it is possible on every well regulated farm, a two-row corn planter, a riding cultivator, and a grain drill with grass seeder attachment will have to be added to the list. Experience is the farmer's best teacher, and a beginner should be governed somewhat in the selection of his implements by what is generally used by successful farmers in his particular locality. In conclusion I beg to differ with H. H. in his estimation of the value of the manure spreader. Good makes of spreaders are on the market now for half the amount he mentions, and my experience in the use of the spreader warrants the assertion that, in my judgment, the manure spreader is the king of labor-saving implements, and if properly used, will pay a big dividend on the capital invested. JORDAN B. WELLS.

Maryland.

"DON'T you want to dance the tango?" he asked. "Indeed I do," said the sweet young thing. "I want to dance it the worst way." "Oh, well, you'll have to excuse me. There are laws against that, you know."—Yonkers Statesman.

GOOD SEED AND A FANNING MILL.

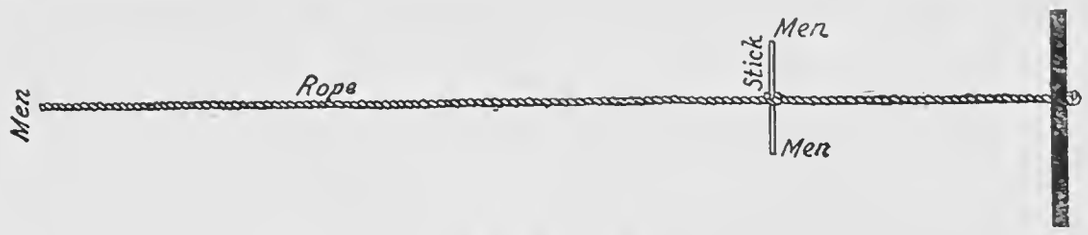
Unless a tool is taken care of, it's a waste of money to purchase; on the other hand if farm tools and implements are given the proper care they are a very valuable asset indeed, and no farmer can get along without some tools to carry on farm work. I don't like the idea of borrowing tools, and again if we can rent some implement to cut our crops, etc., we cannot always get it when most needed. The main thing to consider on any farm where grain is to be grown for chickens, sheep, hogs, etc., whether the farm be large or small, is the selection and planting of good seed. Every well-informed farmer knows the value of good seed grain. Without good seed the fertility of the soil and careful preparation are wasted. This naturally raises the question, what is good seed? The first requisite of good seed is a strong grain which starts quickly into growth when the seed is sown in a warm, moist soil.

In growing grain, and where you expect to get your seed for another year, it should be harvested at maturity without exposure to the sun and rain. The more nearly perfect condition it is in when thrashed and put in storage, the more likely it is to germinate and grow well when used for seed purposes. The use of a fanning mill will eliminate to quite an extent the reproduction of inferior plants, and consequently raises the quality of grain grown on farms where one is found in use. Although the number of days the fanning mill is used is very small indeed, it has been my experience that no grain grower can farm properly unless preparing his seed for the seed bed, and no implement on the farm, large or small, can be used to greater advantage and fill a more important place than this one piece of machinery. Of course it is best to buy one if you can, but you can always find two or three in every community in the hands of some farmer who will only be too glad to let you run your seed grain through. A fanning mill will pay for itself the first year. This fact has been demonstrated to me twice on my own farm. I would advise the use of the latest improved machines, put out by a reliable firm. H. W. SWOPE.

Pennsylvania.

Taking Kinks Out of Rope.

C. M. W., Winterton, N. Y., wants to know how to treat a new hay rope so it will not kink. This is how it is fixed on Ferncliff Farm. I take the rope, tie one end to a post and let a man hold the other end; pull the rope out tight, take fork handle, put rope once around handle, let two men walk from post to end of rope three or four times and the trouble is all over, but the man on the end of rope must let it twist in his hands. The diagram gives the idea. A. B. P.



METHOD OF TAKING KINKS OUT OF ROPE.

Tribes Hill, N. Y.

Four years ago last Summer we bought 175 feet of ⅞-inch rope. When the ground was dry we hitched a horse on one end and dragged it around for about an hour, drawing it around telephone poles, hitching posts and anything of the kind. This rope never bothered once. Perhaps it is not necessary to say it, but in unloading hay, always keep the horse on the same side of the rope. T. E. R.

Clinton, N. Y.

I notice that C. M. W. wants to know how to take and keep the kinks out of a hay rope. If he will put that rope in a barrel of water and let it stay there a week, or until it gets thoroughly wet, he will find it has developed all the kinks there are in it. Then take it out of the barrel and drag it on the ground until all the kinks have run out of it, and his trouble is out. As a fisherman for 28 years, I learned this in breaking in lines to hang in new nets, and also in taking the kinks out of the sheets and halyards of vessels. V. R.

Maryland.

C. M. W., page 300, asks how to take kinks out of new hay rope. If he will fasten a round ball to one end, tie other end to his wagon and drag it up and down the road for a mile or two, it will remove all kinks. Or pass one end around a post (round) and pull back and forth with one end loose; it will do the trick. W. K. K.

Dover, Del.

DO YOU NEED PAINT?

THE INGERSOLL WAY OF DOING BUSINESS

LET ME SEND YOU MY PAINT BOOK. It will tell you all you want to know about paint and painting—**WHY SOME PAINTS** chalk and fade or scale off in a short time and **HOW TO OVERCOME** these difficulties and secure the **BEST RESULTS** at the **LOWEST POSSIBLE COST.**

Cutaway (Clark) Disk Harrows

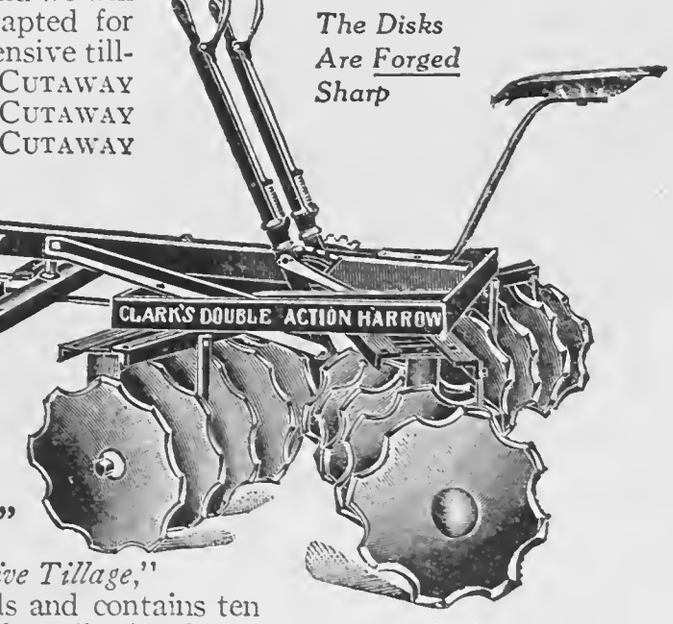
Work Up The Soil Finer Than Other Harrows And Are Lighter Draft

For more than a quarter century we have been making CUTAWAY (CLARK) disk harrows for men who want to till their land more thoroughly, more intensively, than is generally practised. Today CUTAWAY (CLARK) implements are the standard of real worth. They are constructed with utter disregard of the designs followed by makers of other disk harrows. They are built to pulverize the soil finer than other harrows will do, and to do it without increasing the draft. We make

OVER 100 STYLES AND SIZES

of CUTAWAY (CLARK) disk harrows and plows. We have one for every farmer whether he has but one small horse or a large tractor engine with which to pull it. Tell us what your needs are and we will tell you about the tool best adapted for them. If you believe in more intensive tillage of the soil, then you believe in CUTAWAY (CLARK) implements. Ask the CUTAWAY dealer in your town to show you a CUTAWAY (CLARK) disk harrow or plow. If we have no dealer there, write to us for catalog. We ship direct where we are not represented by an agent. Don't accept a substitute.

The Disks Are Forged Sharp



Write today for free book "The Soil and Intensive Tillage"

Our booklet, "*The Soil and Intensive Tillage*," illustrates CUTAWAY (CLARK) tools and contains ten pages of valuable information on the soil—its chemical and physical properties—the feeding of plants, and intensive tillage. There is also an article by Professor G. B. Upton of Cornell University on the CUTAWAY (CLARK) Forged-edge Disk.

THE CUTAWAY HARROW CO., 839 Main St., HIGGANUM, CONN.

Maker of the original CLARK disk harrows and plows

Pure Rain Water

is generally valued by the housewife in a way that cannot be expressed in Dollars and Cents—it means the lightening of household labors particularly if the regular water supply is "hard." Water from a tar roof cannot be used—one of the many virtues of

"Rain-Tight"
Rubber Roofing

is that the water is as pure and sweet as it fell from the heavens. It is made of Trinidad Lake Asphalt—the standard asphalt of the world. It is the same material that is used to make city pavements, which withstands the constant pounding of horses' hoofs and heavy-laden wagons.

Our brand of "PERFECT ROOFING" is the same as "RAIN-TIGHT" with Mica Flakes added to the surface, which make it fire-resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof.

PERFECT ROSIN SIZED SHEATHING AND PERFECT TARRED FELT ARE BEST FOR SHEATHING PURPOSES

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us to-day.

Maurice O'Meara Co.

PALMER BROS., Coscob, Conn.

Rossney Pear; Blowers Blackberry

1. Is the Rossney pear a good commercial variety? Is it of good quality for family use? 2. What do you know of the Blowers blackberry? I have had it growing three years, and it has never fruited; sometimes has a lot of fruit clusters with only two or three seeds to the berry. It blooms profusely and I have the Ward planted near by. H. G.

Rhinebeck, N. Y.

1. The Rossney pear is of very fair quality, but not as good as the Bartlett and some others. It would probably sell very well in market as it is of good appearance.

2. The Blowers blackberry is considered a good variety, but I have never grown it myself and do not know from experience of its habit of unproductiveness. However this has been reported from several sources and is probably defective in its female organs. It would be well to grow other varieties instead, that bear well. H. E. VAN DEMAN.

Care of Raspberries.

I have a patch of raspberries set out in 1912. August, 1913, the old canes were removed, and the new canes cut back. In September and October they made an abnormal growth, some of the canes being four and five feet. They were heavily manured with hen manure. I wish to know how to prune and care for them this Spring for best results.

Maryland. J. H.

Owing to the manner in which it bears its fruit, the blackcap should have considerable care in its yearly pruning. This should be done at two seasons of the year to get the best results. The young canes should be pinched back when they reach a height of 20 to 24 inches. In order to have the canes all about the same height, it will be necessary to go over the patch several times during the growing season and stop them as soon as they are high enough. This early pinching back will induce the development of more numerous side branches, and as the side branches form the fruit bearing wood for the following season, the more of them that can be developed the heavier the crop will be. This Summer pruning or pinching back of the new canes, is the most important factor in the culture of the crop, and must be carefully attended to, if the maximum results are to be obtained. The following Spring the side branches should be shortened back to 10 to 15 inches according to the size and and strength of the cane. The old fruiting canes should be cut out, removed and burned as soon as the crop is off; by so doing, many injurious insects will be destroyed, and perhaps disease be prevented.

Red raspberries should also have attention during the Summer, to regulate the height of canes, and induce the formation of fruiting wood for the succeeding season. The young canes should be pinched back when not over 24 inches high. This will cause the development of many side branches and also the production of a greater number of sprouts from the root. Both these types of growth are desirable and should be encouraged to a greater or lesser extent, according to the variety and the character of the soil, and the fertilizer used. The removal of the old fruiting canes may be deferred until Winter, when at the same time all the unhealthy-looking young canes should be removed. Good clean cultivation is necessary with both types of raspberries. The space between the rows should be plowed with a one-horse turning plow at least once a year, preferably in the Spring. The cultivation therefore should be sufficiently thorough to keep all weeds subdued, but should not be carried on late enough to interfere with the harvesting of the crop.

K.

HARDY PEACH BUDS.—The varieties that seem to stand the most freezing are those in most instances that develop small, tight, compact buds. The one variety of the large loose buds that seem to be hardier than others is the Belle of Georgia, and why this happens I do not know. In fact, I do not know anything about any of it, except long experience seems to show that the tight little buds, such as on Hill's Chili, Carman, Waddell, Champion and the like are the ones that come through the extreme freezing weather all right, when those of the Crawford type, Oldmixon and Elberta get killed entirely. THE RURAL NEW-YORKER
333 W. 30th St., New York City

Ownership of Timber Along Roadside.

A owns a farm; he sells the wood and timber on the farm to B. Later on he sells the land or farm to C. When he sold the wood and timber to B it was understood that B should have three years to cut and remove the same. C understands that his purchase of the farm is subject to the above deal. Who owns the wood and timber on the roadside? B claims it. What right has he to it, or had the owner any right to give him any right to cut it or embody it in the wood and timber deal? It is generally claimed that the wood and timber on the roadside belongs to the man who owns the farm, inasmuch as B had not cut the wood and timber before C bought it why does not the wood and timber belong to C? M. T. R.

Rhode Island.

It is generally understood that the ownership of trees along the roadside is in the adjoining owner. In this case it belonged to A, and when he sold the wood and timber on the farm to B it passed to B, and he did not lose that right by merely failing to cut to the present time. If he abandoned the cutting and showed that he did not intend to avail himself of the wood along the road, the ownership might pass to the present owner of the farm. Inasmuch as C has recognized B's right to the timber he must also recognize B's right to the timber along the road.

Title to Property on Seashore.

Will you give us the law as relates to control of shore privilege by owner of land bounded by the sea? Can said owner forbid and prosecute parties for taking seaweed which floats in at high water, also for taking seaweed from rocks at low water. W. F.

Maine.

As a general proposition, the title of an owner adjoining the seashore extends only to high water, but in Massachusetts and Maine this rule has been changed so as to give the soil of the shore to the land owners to low water mark provided the tide does not ebb more than 100 rods and to that extent if the tide ebbs to a greater distance, so that you own the property to low water mark and can keep trespassers off.

In regard to the seaweed which floats in at high water, if the same is obtained by people in boats before it affixes itself to your property, it probably would belong to the person that collects it, but they cannot go on your property to collect it. If they do they are trespassers. To make this seaweed your property, it must combine itself with the particles of soil in the adjacent land in such a manner that it can fairly be said to have combined with it so that it really becomes part of the soil. It then belongs to you.

"More or Less" in Deeds."

C came to me (S) to buy my land with buildings. S (myself) shows C together with a different relation of C's on two separate occasions, the dividing fences and all boundary lines, etc. (which C now acknowledges). S from slip of memory believed and at both times told C that there is about but not quite five acres of land. Lawyer draws agreement from description of both parties (deed not at hand), S to deliver April 1 to C the land with buildings now owned and occupied by S, bounded by lands of D., E., F., and G. No measurements given except five acres more or less. C pays $40 balance on acceptance of deed. Deed tendered C, drawn exactly as original deed to S shows three and one-fifth acres only. C refuses deed while acknowledging that S in transferring all the land S owned at any time, and the identical piece of land he examined as to boundary lines, etc., but that S must deliver five acres as per agreement or pay C (excessive) damages. C and relatives claim willingness to swear S stated S had measured land, which is false, and S not capable of doing so. Is this the law of Pennsylvania? S.

Pennsylvania.

The law in Pennsylvania and elsewhere seems to be that "more or less," as used in the description in a deed, indicates an intention that any small variation either above or below the number of acres mentioned shall be no cause for complaint by either party. For any small deficiency the purchaser will be held to have assumed the risk, and for any small excess the vendor will have no relief. In order to maintain an action on the ground of variances between the number of acres actually contained in the tract and that stated in the description, there must be some evidence of fraud or mistake. In this case, where S states that his land contains five acres more or less, and there is found to be three and one-fifth acres, there is considerable of a discrepancy, and notwithstanding the fact that C knew the boundaries, it may be held that there is too great a difference. It would, however, all depend on questions of fact; that is, whether C was sufficiently acquainted with land to know by viewing the parcel whether there were three or five acres in it, and whether S knew that there were only three and one-fifth acres when he told C there were about five acres. If C will take a reasonable view of the matter and accept a reasonable amount of settlement, that would appear to be the best way out of the difficulty.

Owner's Right in Adjoining Stream.

We are two women who own a farm, our home. There is a stream running across a part of it; then running across a yard, where our stock (horses, cattle and poultry) have to get their drinking water. In Spring (in March) when spraying of orchards is going on, a neighbor above, either rinses his barrels of spraying mixtures, or somehow gets the mixture into the creek, so that it comes down the creek (the current is not strong enough to carry it farther) and settles in the stream where my stock have to get their drinking water. It poisons my fowls, and I am afraid for my stock, as they do not like to drink it. He also has a concrete dam in the creek, also puts his rubbish in the side of stream, which washes down on us, (tin cans, etc). What can we do? P. L. W.

New York.

It is your right, as owner of land through which a stream runs, to have the stream continue to flow through your premises in its natural condition of purity and free from any contamination or pollution, such as would render it unfit for domestic or farming purposes, but this right, of course, is subject to the right of each proprietor to use the stream to a reasonable extent, and each owner is entitled to make such use of the stream as does not inflict substantial injury upon other owners. It would seem from your letter that the neighbor is making such unlawful use of the stream as to injure your property and damage your rights in the stream. Before writing to the State Board of Health, it might be well to send a letter to the owner who is doing the damage. If he does not stop polluting the stream, you can sue him for damages and also complain to the State Board of Health. Neither does the owner higher up the stream have the right to obstruct or detain the water of the stream to your detriment. You have a right to the unobstructed natural flow of the stream, and another owner cannot detain or consume so much of the water as may interfere with your rights. Of course, each owner along the stream has a right to as much water as may be reasonable and necessary for his proper domestic and farming uses, but he has not right to dam the water and keep it from you entirely, unless he has acquired it by prescription, that is, used it in that way to you or your predecessors' detriment for 20 years or more.

Getting Rid of Gray Squirrels.

Can you tell me how to get rid of grey squirrel? I have a couple of acres in a small suburban place, and am overrun with them. They not only destroy buildings, but I have seen them eat birds' eggs, destroy their nests, and they clean out my strawberries and cut off my fruit, dig up my bulbs and flowers and do great damage to my young trees. I don't want to shoot them, but all other methods have failed. I have tried arsenic and strychnine mixed up with nut food and placed it where the birds could not have access to it, and though the foraging must be hard work in this deep snow, they won't touch the poison offered. S. S. W.

West Newton, Mass.

R. N.-Y.—We turn this over to our readers who seem to have had experience with all sorts of things, from blessings to pests.

What Ruins Your Tires?

Note How We Combat It in No-Rim-Cut Tires

Is it rim-cutting? That does ruin almost one in three of the old-type tires. It is the chief cause of tire expense.

But we make that impossible in No-Rim-Cut tires by a method which we control.

Is it blow-outs? No-Rim-Cut tires are final-cured on air bags, under actual road conditions. Thus we save the countless blow-outs due to wrinkled fabric.

This extra process—used by no other maker—costs us $450,000 yearly. But it saves our tire users millions of dollars in blow-outs.

Is it loose treads? We paid $50,000 for control of a process which lessens this danger by 60 per cent.

Is it tread wear? Then use Goodyear All-Weather treads. Double-thick treads made of very tough rubber. Made flat, so they run like smooth treads on dry roads, yet they offer wet roads a resistless grip. These treads are immensely enduring.

Needless Waste

Any tire cost you suffer for lack of these features is a needless waste. No-Rim-Cut tires offer all these protections. No other tire in the world offers one of them.

That's why these tires rule Tiredom. Last year our sales were $33,000,000. We sold 11 times as many tires as in 1909. And this year's sales show the largest increase in our history.

Men have bought, in the past two years alone, more than two million Goodyear tires. They bought them because countless mileage comparisons have proved them the greatest tires.

Lower Prices

Prices on No-Rim-Cut tires, in the past year alone, have dropped 28 per cent. Now they far undersell some others. But that is due to our mammoth output, to our efficiency, and to our modest profits. Last year our profit averaged 6½ per cent.

At Goodyear prices you can get the best tires men can build. And you get four costly, tire-saving features found in no other tire.

Give these tires a chance to prove themselves this summer.

Goodyear dealers are everywhere.

THE FARM SALE.

The picture given below will show how many of our northern farmers may be found during the next two or three weeks. This picture was taken in Western New York. The season of farm sales has come, and when they are well advertised, they generally call out a crowd. With this late Winter, there is not much to do around the farm, except the ordinary chores, and this leaves farmers free to attend such sales. Sometimes there are real bargains to be found in stock or tools, and at any rate, the farmers like to get together and visit and talk over matters which are of general interest, and so when the auctioneer begins his talk, there is usnally a crowd around

WHERE THE FARMERS MAY BE FOUND NOW.

him, very much like the one shown in this picture. In fact, the country auction sale is a recognized feature of rural life, and will continue to be such for a good many years to come.

Beets, Carrots and Parsnips.

I have a piece of land of about five acres that has been used for a cow pasture, or more of a cow yard; 12 cows have been kept in same, and green stuff hauled in to them so the land has been well manured. I plowed it last Fall and had a good dressing of cow manure on the sod after it was turned over. I am thinking of planting beets, carrots and parsnips on this land, and would like to have your advice as to whether these roots would be smooth. Some of my neighbors tell me that in their opinion they would be prongy and rough.

Danvers, Mass. G. W. D.

As a rule it is only when fresh stable manure is used in the growing of these root crops that they grow prongy or otherwise deformed. The beet requires a somewhat richer soil for good results than either the carrot or parsnip. In some of the large market gardens of the country as much as 60 tons or more of well-rotted manure to the acre is used for beet ground when it is intended to follow them with celery or other late crop, but if beets alone and but a single crop is grown on the land the quantity of manure is reduced to 35 or 40 tons to the acre. For the production of good marketable carrots or parsnips, 20 to 25 tons of well-rotted manure to the acre is sufficient. Cow manure is much less liable to cause deformity in root crops than any other kind produced on the farm, and the fact that your land was manured and plowed last Fall should in a great measure remove the danger of any great amount of the crop being deformed, as you have practically the same manurial conditions as would have resulted by composting the manure and applying after it had become well rotted. The best soil for carrots and parsnips is a deep sandy loam that has been heavily manured and cropped to corn or similar crop the year previous. Very little deformity will result to the roots grown in soil handled in this way. K.

Scientific Cultivation of Corn.

Which is the approved scientific method of cultivation of corn, to use a cultivator and leave the ground in small lumps, or to use a weeder and leave a "dust mulch?" I have heard arguments on both sides. Will you give me the correct method? E. S. R.

Pottstown, Pa.

There are a dozen approved scientific methods of cultivating corn. Science must adapt itself to conditions, and these vary with soil, climate and weather. With the average season, for corn culture, the best plan is to do a good share of the cultivating before the seed is planted. This means plowing properly, and harrowing many times before planting. This fitting immediately after plowing holds moisture in the ground and kills multitudes of weeds which would otherwise grow in the crop. Generally speaking, level culture with some shallow working tool is best for the corn crop. This would mean working the ground with a weeder, from the time the seed is put in until the stalks are about 18 inches high. After that a cultivator with small shallow teeth is used to keep what is known as a dust mulch on the surface of the ground. The plan of cultivating so as to leave lumps is not a scientific method in our average saeson of rainfall.

There are conditions, however, when this shallow dust mulch would not make the best cultivation. Occasionally we have a very wet season. The rain falls constantly through the earlier part of Summer, or when the corn is beginning to form its ears. We then have too much moisture in the soil, unless the ground has been perfectly drained. The object in a wet season is not to hold moisture in the ground, for the crop will usually be better if this surplus moisture is taken out. In such cases a rougher and deeper cultivation will pay better, or even a plowing between the rows will help, as this would hasten evaporation of the moisture and stop the corn from making an excessive growth of leaf and stalk. Thus it will be seen that no definite rules can be given for cultivating corn, as all the conditions must be considered, and the cultivation adapted to them. During the past few years still another scientific method has been suggested. This means no cultivation at all, but simply keeping down the weeds by hand pulling or scraping or slicing off with a hoe. Killing out these weeds prevents loss of moisture which the weeds would naturally take, and it has been found that in a heavy corn crop there is less evaporation of moisture from the soil than with most other crops. At least many careful experiments have shown that corn handled in this way without any cultivation whatever, but with the weeds destroyed, gave as heavy a crop as where the corn was thoroughly cultivated in a scientific manner.

WILLIE was struggling through the story in his reading lesson. "'No,' said the captain," he read, "'it was not a sloop. It was a larger vessel. By the rig I judged her to be a-a-a-a-a——'" The word was new to him. "Barque," supplied the teacher. Still Willie hesitated. "Barque!" repeated the teacher, this time sharply. Willie looked as though he had not heard aright. Then, with an apprehensive glance around the class, he shouted: "Bow-wow!"—Detroit Free Press.

ROOFING

Sample Free

THERE is a community up in Vermont that has found out all about Amatite. It began with a single farmer who wanted to roof a shed on his farm. He had heard that a new roofing had been invented which needed no painting. He found that its name was Amatite and he bought some and laid it. He found that it was just as easy to lay as the old-fashioned painted roofing, and it was sold in rolls with nails and cement supplies free as usual. And he found also that Amatite Roofing instead of costing more as might have been expected, actually cost less than other roofings of much less weight.

After the first winter, he noticed that the Amatite was exactly as good as ever, and after the second winter he was still unable to detect any change in it.

He has other roofings on his farm and he was accustomed to giving them a good heavy coat of paint every two years just as the manufacturers of those roofings urged him to do. He was glad that it was not necessary for him to paint the Amatite roof after the second year. It saved him money and trouble.

He began to tell his neighbors about Amatite, and the local dealer laid in a stock of it. Other farmers began buying it and had the same experience—the roofing gave faultless service year after year with no trouble whatever to the owners.

It is five years since the first Amatite Roofing was laid in that town. Now, Amatite is the principal roofing sold there. It has won its way on its merits.

If you would like to have a sample of Amatite Roofing just to see what the mineral surface is like, we will send it to you free of charge.

Soaking Seed Potatoes for Scab.

I am advised to soak my seed in a solution of one pint formalin to 30 gallons of water for two hours. Will not this break off or injure the sprouts?

Soaking will break off many of these sprouts and the solution will injure their vitality a little; planting either by hand or in the planter will also break off more or less of the buds, but they usually sprout again and give a fair plant. Seed potatoes should not be permitted to make long thin sprouts, which are produced usually in warm and dark cellars. The seed potatoes ought to be spread out in some dry sunny place at least two weeks before planting. This place should be where the potatoes can be protected from frost. Thus exposed the tubers will make short heavy sprouts containing far more vitality than the long thin sprouts formed in the dark. These heavy sprouts will not be injured by the soaking, but this soaking may well be done a week or more before planting.

A farm paper states that this work may be hastened by piling the potatoes on the barn floor, sprinkling the solution over them and covering with a blanket.

We have not tried this plan of piling potatoes on the barn floor. This is the method followed after treating oats for smut. The oats are put in a pile and well soaked down. Then cover with blankets or sacks for two hours and spread out to dry. The oats absorb a large quantity of moisture and enough of the gas formed with them to cover the work and go through the pile and kill the germs of disease. The potatoes being very much larger when thus piled up would not, of course, absorb as much of the liquid, and we should doubt if enough of the gas would be formed under these conditions to destroy the scab germ. We should prefer the old plan of soaking, although it takes more time.

What about using sulphur? Is it fully equal to the formalin solution?

In our experience powdered sulphur in a dried form is not equal to the formula solution for destroying the scab germ. It does unquestionably kill some of these germs. Its chief value seems to be for preserving the cut pieces in the ground. It also makes something of an acid condition in the soil around the seed pieces, and this helps to prevent the work of the germ. We think it wise to use the powdered sulphur even when the seed has been properly soaked. We put such seed into peach baskets, scattering about two handfuls of powdered sulphur over the seed as it is put into the basket. The basket is well shaken down two or three times. A quantity of the sulphur is dropped out at this shaking upon a paper placed under the basket, so that it may be saved for further use. We think this sulphuring in combination with the soaking of the seed will pay.

Potato Blight in Winter.

The New York (Geneva) Experiment Station has tested the theory that the fungus causing potato blight does not winter over in the soil.

To test the liability to such transmission, the Station Botanist has carried on careful tests in two seasons; and finds no evidence that the fungus can survive the Winter in the field, in central New York, at least. In each of the tests, soil from a field of diseased potato plants was thoroughly mixed, in boxes, with broken, rotten tubers and pieces of blighted stems; and the boxes were exposed to the weather during early Winter. Later the boxes were brought into the forcing house, a sound potato tuber was planted in each and conditions made as favorable as possible for growth of plants and development of the disease. In spite of warmth, abundant moisture, both in the soil and in the air and luxuriant, succulent growth of the plants, not a sign of blighting appeared, even when the plants were grown in a special glass chamber and thoroughly wetted daily with water drained from some of the soil mixed with diseased material, or were painted with a thin mud made from such soil. The results, being negative, do not prove that the late-blight fungus cannot remain alive over Winter in the soil, but they make such persistence appear highly improbable.

It would seem unnecessary, then, to change the location of the potato crop to avoid this disease; especially as we know that thorough spraying will control both blight and rot and will increase the crop enough, taking one year with another, to make this a highly profitable regular practice in potato growing. The spraying of late potatoes should never be neglected.

Sulphur and Iron Pyrites as a Fertilizer.

Some recent experiments in France throw some light on this subject. Based upon the fact that sulphur is known to aid nitrification by entering into the chemical reactions that take place when organic and ammoniacal fertilizers are applied to the soil, these experimenters planned two series of tests. In one series nitrate of soda was used as the source of nitrogen, and in the other series dried blood was applied in such quantity as to furnish an equal amount of nitrogen as the nitrate carried. Two methods of application of the sulphur and pyrites were employed in each series. One method was to apply the sulphur to the surface of the soil at the rate of 50 and 100 pounds per acre, and the other was to mix it thoroughly with the soil at the same rates per acre. The results all along the line of the nitrate of soda series with wheat and beans showed only a variation of from two to four per cent. increase or decrease in yield. But quite different were the yields in the dried blood series. Both wheat and beans yielded better when the sulphur was thoroughly mixed with the soil than when applied on the surface only. The larger application of 100 pounds per acre showed much higher yields than the 50 pounds application all through the experiment.

In the dried blood series with 100 pounds of sulphur applied on the surface, the yield of wheat increased 21 per cent. and when that amount was mixed with the soil the increase was 30 per cent. With beans the increases were 30 and 60 per cent. respectively. Twice as much of the pyrites was applied as in the case of the pure sulphur. With an application of 200 pounds of pyrites per acre in the dried blood the wheat yield increased 20 per cent. in case of surface application, and 41 per cent. in case of a thorough mixture, while the yield of beans increased 25 and 52 per cent. respectively. These results indicate that sulphur and iron pyrites (a compound of sulphur and iron) may be used as fertilizer ingredients under certain conditions. G. M. T.

Postage Package for Boiled Cider.

Where can I buy packages in which to ship boiled cider by parcel post? The boiled cider is thick (soft jelly) but will require a tight package. Common jugs might do by packing them in a wooden box, but it makes the package pretty heavy. I do not think it safe to put it into tin cans; the acid would eat the cans and spoil the cider. Probably aluminum would cost too much. Glass of course is all right; cans, jars or bottles, and I am told that they are shipped by parcel post, but I don't know how they are packed. Perhaps there may be wooden kegs that are all right for the purpose? I wish to ship from one quart to three gallons. (Anything less than 50 pounds, package and all). Can you give me information that will help me out in this matter? D. J. C.

Randolph, Vt.

This was forwarded to the scientific assistant who has charge of the work of investigating suitable packages for farm products at Washington. He says:

I am without experience in that line. Wooden kegs properly made would perhaps serve the purpose quite well for the larger quantities within the weight limit of 50 pounds. For smaller quantities a metal container, something like those used for maple syrup, might answer the purpose. These would need to be enclosed within a wooden box or a corrugated-pasteboard container of at least two thicknesses. A metal container would have to be sanitary-enameled or lacquered on the inside to prevent the action of the acid in the cider on the metal. A person desiring to work up a business of this kind should consult his local postmaster to ascertain what kind of container he would admit to the mails and how it should be packed. The danger of leakage from puncture or other cause is considerable, and I do not know whether the postal authorities will sanction any kind of container for liquids other than those specified in the parcel-post regulations, with which the inquirer can familiarize himself by inquiry of his local postmaster. LEWIS B. FLOHR.

EVENTS OF THE WEEK.

DOMESTIC.—The factory of the Eclair Moving Picture Company at Fort Lee, N. J., was destroyed by fire, March 19. The damage is estimated by the company officers at $650,000. In the basement vaults were completed negatives valued at thousands of dollars. These were destroyed. Films colored by a recently discovered process and which had been imported from France recently at a cost of $50,000 also were ruined. Only one piece of machinery, a lathe, valued at $1,500, was saved. Credit for saving $60,000 worth of films is given to the girls employed in the joining room.

The Windsor Hotel, at Milwaukee, Wis., was burned March 19, causing a loss of $300,000. Eight of the hotel's guests had narrow escapes from death; many others fled in their night clothes and took refuge in the lobby of a theatre across the way.

One man is dead as the result of a riot between strikers and deputies at the Gould Coupler Plant at Depew, near Buffalo, N. Y., March 23, and eight others were wounded, several dangerously. The town was placed under martial law March 24.

The largest business block in Durham, N. C., was destroyed by fire, March 23. The Duke Building, occupied by 5 and 10 cent stores and 200 offices was destroyed. The water main burst, and the fire continued to spread. The damage was estimated at nearly $1,000,000.

The 10-hour woman's labor law of Massachusetts was upheld as constitutional, March 23, by the Supreme Court. Massachusetts passed in 1909 a law limiting the employment of minors and women in manufacturing and mechanical establishments to 56 hours a week and 10 hours a day, with certain qualifications. The State reduced the hours from 56 to 54 in 1911, but the latter law was not in question in the case now decided. The case was carried to the Supreme Court on the appeal of Richard G. Riley, a superintendent in the Davol mill, in Fall River, who was convicted of requiring a woman to work five minutes over ten hours.

Over $10,000 profit in one year from the local saloon, which is owned by the municipality, is the report of the citizens' committee in charge of the grog shop, at Sisseton, S. D. Sisseton was dry for two years. Then the citizens voted it wet, and the city decided to hold the one license to be issued. A manager was hired and the saloon opened. The earnings will be divided between the municipality and a special road fund.

According to Frank W. Schumaker, on trial with other officers of the Sterling Debenture Corporation in the federal District Court for using the mails to defraud investors in the Oxford Linen Mills Company, more than 8,800,000 letters were mailed to prospective investors in the two years of its existence. It was shown that the circulars cost $753,000, of which, at the average cost of 3 cents for postage, the Postoffice Department received about $260,000 before its inspectors began to get evidence against the concern.

At a special meeting of the East Side Horse Owners' Protective Association in the University Settlement, March 24, a committee was appointed to wait on District Attorney Whitman and District Attorney Cropsey to inform them of a sudden recurrence of horse poisoning and horse stealing. Morse M. Frankel, director of the association, said that horse poisoners whose cases had been unaccountably postponed in the criminal courts were boasting on the East Side that the District Attorney was behind them. Within two weeks seven horses have been poisoned and 68 stolen.

FARM AND GARDEN.—Frederic W. Taylor, director of agriculture in the Philippine Islands, has resigned his position and will return to the United States.

C. L. Marlatt, chairman of the Federal Horticultural Board, is authority for the statement that, during the month of February, 44 nests of Browntail moth were detected on nursery fruit stocks imported from France. Attention is also called to the finding of an undescribed canker disease on chestnut from Hongo Tokyo, Japan, by California State inspectors at San Francisco. According to Dr. Haven Metcalf, the disease appears to be of the same type as the chestnut-bark disease, and there is every indication of its being equally as destructive if established in this country.

Dr. J. W. Robertson of Ottawa was re-elected to the presidency of the Canadian Seed Growers' Association at its concluding session. Mr. L. H. Newman of Ottawa was reappointed secretary.

A special feature arranged by Prof. A. H. Nehrling, of the Massachusetts Agricultural College, was a floricultural day which was held March 18. The program was very comprehensive, and the addresses were interesting and instructive.

All sorts of expositions are being held but here is a new one, the "Vermont Juvenile Agricultural Industrial Exposition," will be held at Windsor, Vt., on October 26. This is a new one, in the fact that it is the first time, probably, that an exposition has been held in New England for the purpose of showing the work of children. The exposition will include all sorts of farm products and all manual training products, such as, sewing, cooking, cement work, etc. It is an admirable scheme and has been planned by the Windsor County, Vt., Y. M. C. A. This association has held its children's corn show very successfully for three years, and we hope this exposition will be equally successful.

The Senate passed a bill, March 23, which authorizes the carrying in the mails of bulbs, seeds, plants and bushes at fourth class rates instead of second class as at present.

Plans for a nation-wide coöperation of farmers, backed up and financed by national and local banks, were discussed, March 23, at a luncheon given by the executive committee of the National Civic Federation at the Hotel Astor, New York. Chief among the speakers were Lieutenant Governor Sheffield Ingalls of Kansas, Andrew Carnegie and Dr. Albert Shaw. Agricultural educators from all sections of the country were present, and Dr. Seth Low, president of the federation, presided. The high cost of food products as one of the direct results of the lack of "industrialized agriculture" was one of the chief points Lieutenant Governor Ingalls made in his address. While the United States, he said, had been developing the theory of farming to its utmost point European countries had been making practical use of this knowledge, to the discomfiture of their teachers.

The New York Board of Water Supply wants 1,250,000 little evergreen trees to plant along the 40 miles of shore on the Ashokan and Kensico reservoirs in the new Catskill water system. It has asked contractors to bid on supplying the trees and setting them out within three years. They will be expected to replace trees that die. The trees are to protect the water along the thousand foot strip that the city owns on the shores of the reservoirs. The Board of Water Supply wants evergreens because leaves from deciduous trees are apt to turn the water brown in the Fall. The board grew 1,000,000 little evergreens in its own nurseries and set them out last year, and 500,000 more, which it bought from the State Conservation Commission.

The New York Milk Committee, through Paul E. Taylor secretary, has sent a protest to Governor Glynn and the State Legislature against the Webb bill in the Assembly and the Wheeler bill in the Senate, which were designed by their authors to strengthen the pure milk law and to hasten the elimination of bovine tuberculosis. The complaint against the bills is that they provide for a physical examination of cattle rather than the recognized tuberculin tests, and that they would not reach the necessity found for stamping out the disease in the dairy herds. It is pointed out that the tuberculin tests discovers 98.8 of tuberculous cattle, the physical examination from 3 to 5 per cent. The bills are attacked as uneconomic. The Milk Committee says 500,000 of the 1,500,000 dairy cows in the State are tuberculous and that the present State appropriation of $200,000 to pay for them is inadequate.

Recently Mrs. C. W. Morse brought a box of "meadow ants" from Europe, which she kept as pets. They were held by inspectors at New York, and the Department of Agriculture finds them "injurious insects, damaging meadows, lawns, and in some instances field crops," and decrees that they be shipped to Washington for destruction. According to the act of Congress, March 3, 1905, chapter 501, any insect injurious to vegetation is prohibited from importation.

By George! Wife, They're Right!

Fuller & Johnson Says

"In the Spring, the farmer is about the busiest man going. It takes all his time for plowing and planting. Right now, *before* the busy time sets in, is the time to find out all about the

FULLER & JOHNSON Farm Pump Engine

It means a whole lot to be sure of plenty of cool, fresh water all the year around. The F & J Farm Pump Engine does this and more.

Get the new catalogue with a full complete description. Convince yourself that this engine is one of the biggest labor savers for the farm. Fits any pump, no belts, no anchor posts, no special platform needed, no extras to buy. Comes complete. Sets right up to the pump ready to run. Don't wait until you are too busy. Get Catalog No. 17 NOW."

SWEET POTATO QUESTIONS.

In regard to space required for growing 1,250,000 plants, we have two furnace-heated beds. One of these is 50x12 feet (600 square feet). We have run it several years, and it produces on an average 50,000 or 60,000 plants at one pnlling. It is customary here to make but one pulling, because all are working for early potatoes. It might be advisable to make two pullings, but we could not count on as many plants from the second pnlling as from the first. By firing onr bed very hard at the start and keeping it quite moist we could get more than 60,000 plants from 600 feet of bed space, bnt the plants wonld be too spindling for best resnlts. Then too, even if we did force them we could not depend on getting the potatoes to sprout heavily every year. Therefore when making only one pulling I would allow about 12,000 sqnare feet of space for producing 1,250,000 plants.

We have used furnace-heated beds and manure-heated beds. Both work well under favorable conditions, but the furnace-heated beds have the preference when it comes to growing any qnantity of plants. For less than 20,000 I would use a manure-heated bed. Above that quantity I would use either a furnace-heated bed or one heated with hot water. I believe this will be the future heating system for sweet potato beds, because it avoids all risks from fire and gives a uniform heat that is impossible to secnre in any other way.

I lately met a grower who made a hot-water heated potato bed last Spring. This grower has been very successful in the past with the furnace-heated bed, bnt his new bed gave him much better results than he ever secured with the furnace-heated beds. His bed was about 50x12 feet; there was no deep pit under the bed, no sleepers or boards to fall down on the flue and catch fire. He was very careful to get a good grade; then he dug a pit at the lower end of the bed for his heater, which was a small second-hand one formerly used in a brooder house, costing $27 when new. From this were run regular two-inch hot-water pipes; first a flow, then a return, alternating across the bed. As I recall it there were about 10 lines of pipe laid about 14 inches apart, and they must have been eight or 10 inches below the line of the potatoes. The pipes were in the sand, but a layer of old well-rotted manure had been placed below a layer of soil before the potatoes were put in. An expansion tank was located at the high end of the bed. A farmer-plumber did the work, and the cost to the grower was approximately $50 for the pipe and piping. This together with the heater made a total cost of $77. It took one-half ton of coal to heat the bed this season. If making another bed he would make bnt one change, and that in the heater. He would have one a little larger, and then he could heat two beds with the one stove, and at the time feel that he had a little extra heat in reserve if needed. The larger stove or heater would cost him $40, which with the piping would make a total cost of $90 for the outfit.

A furnace-heated bed requires an arched brick furnace four feet long, 1½ feet wide and 2½ or three feet high, and one or more flues of brick or tile to run two-thirds the length of the bed, besides heavy sleepers to go aeross the bed every five feet and enough boards to make a floor upon which the bed proper is made. The cost of this will depend on local conditions, cost of lumber, etc., and can best be figured out by the builder. The hot-water heated bed requires only enough lumber for the sides and ends. If a farmer wants to grow potatoes for only two years, I believe the furnace-heated bed will be the cheapest for him, provided he takes every precaution to avoid risks from fire. But for a permanent investment I feel sure the hot water would give best results. A furnace-heated bed can be built on level land, provided the land is far enough above the water level so the furnace will not be flooded during the Spring rains. Enough soil can be scooped off to make a good grade of one to two feet, which is sufficient to get a good draft. I have never seen a steam-heated bed, and cannot say how it would be best to run the pipes.

If the manure is intended for the field it will be entirely practical to gather it and hold it until March. Before commercial fertilizers came into existence, manure was used altogether, in this section, for sweets. It was hanled in the Fall, composted, and then turned once or twice before distributing it in the row in the Spring. Now manure is used broadcast, preferably for the crop preceding sweets, and fertilizer nsed in the row for sweets. Wood ashes are costly here and we have never used them, but we are convinced that sweet potatoes need a large amount of potash, and they want a sweet soil. Wood ashes contain both lime and potash and should be beneficial. The amount of fertilizer nsed here depends on the soil, but abont 700 ponnds to the acre of a 1.65-9-10 mixture distributed in the row is an average application. The fertilizer is distributed with a drill having a tooth behind to mix it with the soil. Most growers use the one-horse drill. Some, however, use a larger one, which takes four rows at a time. We secure far better results by distributing the fertilizer before ridging and have one or two good rains on it so as to wash out the injurious salts that will otherwise burn the plants. The burning from fertilizer is worse on very light sandy soil than on a sandy clay loam.

Sweet potatoes do not give best yields on acid soils and I would, by all means, use lime and I would buy the kind that gave me the most actual lime for the dollar. When figuring this I would include the labor for hauling, which will vary greatly with local conditions. We have nsed both ground limestone and burnt lime. Both give good results. We use 2,000 pounds of ground limestone and from 800 pounds to 1,000 ponnds of burnt lime per acre on our sandiest soils for sweets. Last year we could get ground limestone at $3.20 a ton f. o. b. our station and burnt lime at $5 a ton. We used the limestone. This year we can get burnt lime at $5 a ton and ground limestone at $4 a ton f. o. b. our station, and we have ordered the burnt lime.

We shall have to go to Missouri in order to be shown how to grow sweet potatoes without cultivation. We begin to cultivate when plants are well rooted, and continue once a week, if possible, until vines cover the gronnd. When planted in hills they are cultivated both ways, which reduces hand hoeing to a minimum. We have regular sweet potato harrows with vine turners attached, and set so as to scrape the sides of the ridges. When planted in drills the harrow can be used one way only and more hand work is necessary. Ordinary garden hoes are used by some growers to break the crust close to the plant, but a more satisfactory tool is the scalper, which is merely a small iron rod bent in the form of a triangle with the base flattened so as to have one sharp edge. This is put in a hoe-handle at a slight angle and used much the same as a hoe. It is light, more effective and an inexperienced hand is far less likely to cut off the small newly set potatoes than with a hoe. The scalper can be made for about 25 cents. When planted in hills the usual distance is 2½ feet each way, although some set plants 2½ feet one way and 24 to 28 inches the other way. In drills the rows are 2½ feet apart and plants 18 inches apart in the row.

There seems to be a great deal of confusion concerning the varieties of sweet potatoes, and quite frequently the same variety is called by two or three names and I have not, as yet, been able to get them satisfactorily straightened out. In regard to Yellow Jersey and Big Stem Jersey, I have always considered the Big Stem to be a form of Yellow Jersey, slightly larger in size, both in potato and leaf, a heavier yielder of longer spindle-shaped potatoes, later in maturing and a trifle more susceptible to attacks of stem rot.

TRUCKER, JR.

LITTLE Willie's mother had made him a fine new pair of knickers, but the little boy complained that they were uncomfortably tight. "They're tighter than my skin, mummie!" he declared. "Don't be silly, dear," remonstrated his mother. "They can't possibly be tighter than your skin." "But they are, mummie! Because I can sit down in my skin; but I can't sit down in these trousers!"—Melbourne Leader.

Studebaker

WAGONS BUGGIES HARNESS

Bought his Studebaker when he came home from the civil war—using it yet

WHEN David Hire, of Syracuse, Ind., got home from the Civil War he bought a Studebaker Farm Wagon. That was 48 years ago, and the same wagon is still hauling fifty bushels of wheat at a load to market.

Here is what Mr. Hire has to say about his Studebaker wagon.

"It may interest you to know that I have in my possession a Studebaker Farm Wagon bought just after I returned from the war, about 1866, I think. It carried a guarantee to haul 50 bushels of wheat and though it has been in constant use since it was bought, it is still good to haul that amount to market. I hope to use it for many years yet, as it is in good condition."

A REAL VETERAN

That is the way with Studebaker wagons. Built of air dried timber, with inspections at every step of manufacture, they outlast the ordinary wagon from twenty to thirty years.

You may be offered a wagon at less cost than a Studebaker, but consider that the cheaper wagon may last five or ten years, while a Studebaker will last a lifetime. That makes the Studebaker the better investment, doesn't it? *"Build not the cheapest, but the best"* has been the policy of Studebaker for over half a century.

You can't make a mistake if you buy a Studebaker Farm Wagon, Buggy or Harness.

Studebakers last a lifetime

"Can't-Sag" Gates Cost Less Last 5 Times as Long

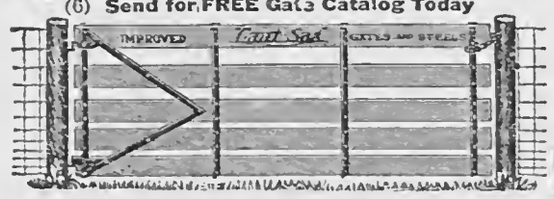
A. V Rowe Pres

I'll save you big money on your farm gates. My new catalog quotes such astonishingly low prices on CAN'T-SAG GATES AND GATE STEELS that you simply can't afford to build another clumsy, all wood gate. My FREIGHT PAID PRICES are half what others charge for short-lived steel, wire and gas pipe gates.

30 Days' Free Trial—5 Year Guarantee

I give 30 days free trial and a signed 5-year guarantee. Send for my big free Gate Catalog at once—see why Can't-Sag Gates outsell and outlast all others. Read what other farmers and stockmen say about them. When you get this book you can either select complete CAN'T-SAG GATES, Ready to hang, any height, any length—painted or unpainted or if you prefer you can order just the GATE STEELS (which includes everything but the boards). With these you can build your own Gates in 30 minutes and SAVE BIG MONEY.

(6) Send for FREE Gate Catalog Today

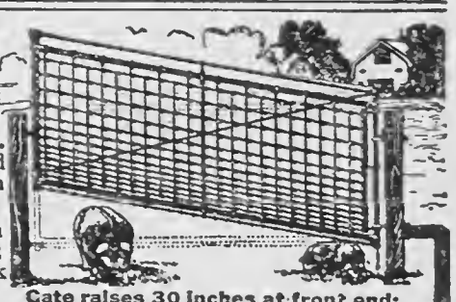


Note These Special Features

Each board double bolted between 4 pairs of ANGLE STEEL uprights and 6 TRIANGULAR TRUSS BRACES. Patent reenforced SELF-LOCKING HINGE. Gate swings easily both ways—always hangs square and plumb. Elevating Attachment (furnished at slight additional cost) permits gates to be raised over deep snow or allows small stock to pass under. Write for FreeCatalog and FREIGHT PREPAID OFFER TODAY. Address

A. V Rowe, Pres. Rowe Mfg. Co., 706 Adams St., Galesburg, Ill.

Republic Hercules Gates



Cate raises 30 inches at front end; 12 inches at hinge ends.

You have to handle your big farm gate a dozen times a day. Why bother with a heavy, saggy, back-straining, rickety old wooden gate that gets snow bound in winter, mud bound in spring and summer, and soon falls to pieces?

For less money you can install a Republic Hercules Gate, which you can adjust to any position you like with little effort; always swings clear; locks automatically; resists all stock—lasts a lifetime.

You can tell a Republic Hercules Gate from any other Gate made, by its simple, strong construction; its solid tubular steel frame; its heavy, firm-standing, durable fabric; its easy raising device; its malleable iron fittings; its freedom from troublesome attachments.

We back it with a strong guarantee. Illustrated Catalog FREE.

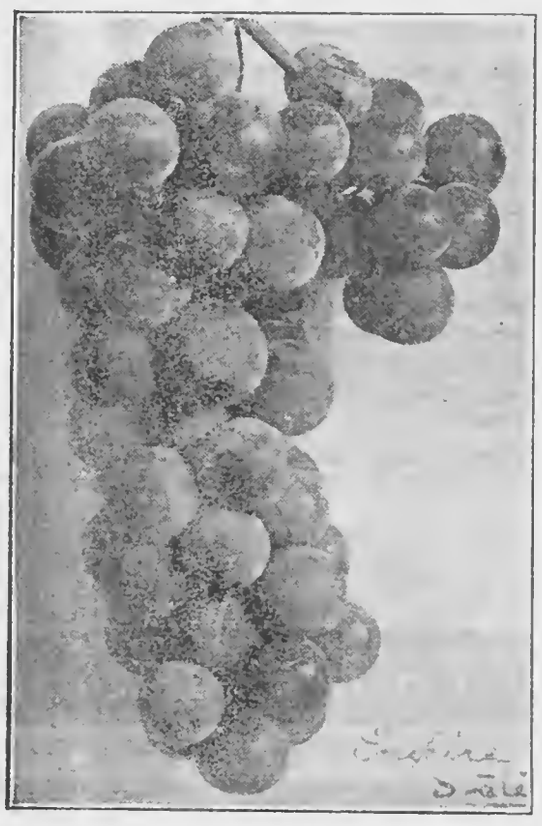
PROFIT IN GRAPES.

Of all the fruits I find the grape one of the most satisfactory. It demands no heavy work, its culture is simple and its fruit is most agreeable to handle. Little extra labor is required for its harvest, there is a pleasing variety in color, size and flavor, a long season of ripening that permits ample time for marketing, and the fruit is not perishable as are most of the other small fruits. It is also profitable where there is a good local market, but in shipping I have had little experience. The local market can generally be depended on to pay considerably higher prices than the city markets, even without deducting the expenses of packing, transportation and commission. In this section three and even four cents per pound have long been the prevailing prices, while large shippers have often to be satisfied with one cent.

In planting for the local market there should be a good collection of varieties, running from earliest to latest, while, for shipping, only a very few kinds are wanted. This collection should consist mostly of grapes of the best quality, suitable for the table and dessert, and not only must they have quality but a great variety in flavor, color and size so as to



GRAPE, EMPIRE STATE.

appeal to every taste and avoid the satiety that a lack of variety might occasion. The demand for grapes as a regular article of diet may be greatly extended by such a judicious selection of varieties of the very best quality, and presented in packages convenient to handle as well as in small quantities. Usually the buyer prefers a small quantity because it calls for little money, is easy to carry home and is eaten up before the grapes have a chance to lose flavor and stale the appetite. One of the best forms for presenting grapes to the grocery trade I have found to be the small open tomato basket without handles, such as tomatoes are shipped in, four to the crate. These baskets hold about 3½ pounds of grapes, attractively heaped up, and are easily carried away by the customer or delivered by the grocer. They retail at 15 cents and the grower nets from three to 3½ cents per pound. Some grocers prefer to buy in half-bushel baskets and retail out by the pound, but I have known grocers to be unable to dispose of them in bulk while they sold readily in the small baskets.

I do not find the shipping basket of eight pounds to be suitable for this local trade. The quantity is too much for the average family, especially in the hot weather of August, when grapes are harvested here, but there is a large trade in half bushel baskets holding 17 pounds heaped, for putting up by the housewife, and selling for 50 cents. This is a very satisfactory form of marketing which I keep in my own hands without the intervention of a middleman. Orders for this trade comes in over the telephone in response to advertisements in the local paper. Such advertising is indispensable, and is not expensive. Usually I keep a regular standing advertisement and in addition, two or three others among the locals which are always read. "To keep well, eat plenty of grapes this hot weather"; "Try our delicious grapes, red, white and blue, for dessert and lunch," are some of the forms we choose to go with local items. I find also that there is an increasing demand for grapes to be made into bottled grape juice, and this usually goes in the form of half-bushel baskets. Sometimes an order for 100 or 200 pounds comes in, and on such a reduction is made.

Next we come to varieties, and I will enumerate those I have found most satisfactory. The earliest good grape to ripen is the Eclipse, coming a few days ahead of Moore's and Campbells. These latter are both very large showy black grapes of good quality, and are very popular sellers at a price generally a full cent above the main crop. Campbell's is the finer grape but is not a success with many growers according to reports. Here it is the best of all my collection, and in the greatest demand as long as it lasts, as it is a splendid keeper it can be made to cover all the season up to the Concord. I note here that black grapes always outsell the whites and reds, while the reds rank next. Other early kinds that must have a place to give variety are the Green Mountain and Brighton. The Green Mountain is a great bearer of a very sweet white grape that always pleases the taste, while the Brighton is a high quality red of great beauty. Then comes the well-known Delaware and the Concord, the latter in great demand, but the former not profitable here. Niagara and Moore's Diamond are magnificent white grapes, exceedingly showy, but their color is against them and their quality is not high enough to overcome the prejudice. There are some whites, however, whose quality will sell them, and of such are the Empire State, Duchess and Wapanuka.

Of reds there is a great list of fine grapes, among which some of the best are the Massasoit, Vergennes, Gaertner, Salem and Jefferson. For a late reddish yellow grape of fine quality and great vigor we have the Goethe. There is a dearth of black grapes later than the Concord, but a fine one larger than Concord is the Wilder, that is later here, and should be included. I find among the varieties originated by the late T. V. Munson some kinds that fill this gap and enable me to sell fine table grapes right on up to frost. These are the Carman, Muench and Fern Munson. For grape juice I find the Concord a good seller, but a better wine grape that will grow anywhere and bear great crops is the Ives, but it is not high quality. The Muench and Fern are fine for grape juice and there are several Munson sorts particularly recommended for this purpose, such as the Wine King and Ben Hur. With the above list any enterprising grower ought to be able to build up a profitable local trade against such competition as is ordinarily found in such markets. It is quality that counts.

L. R. JOHNSON.

Cape Girardeau Co., Mo.

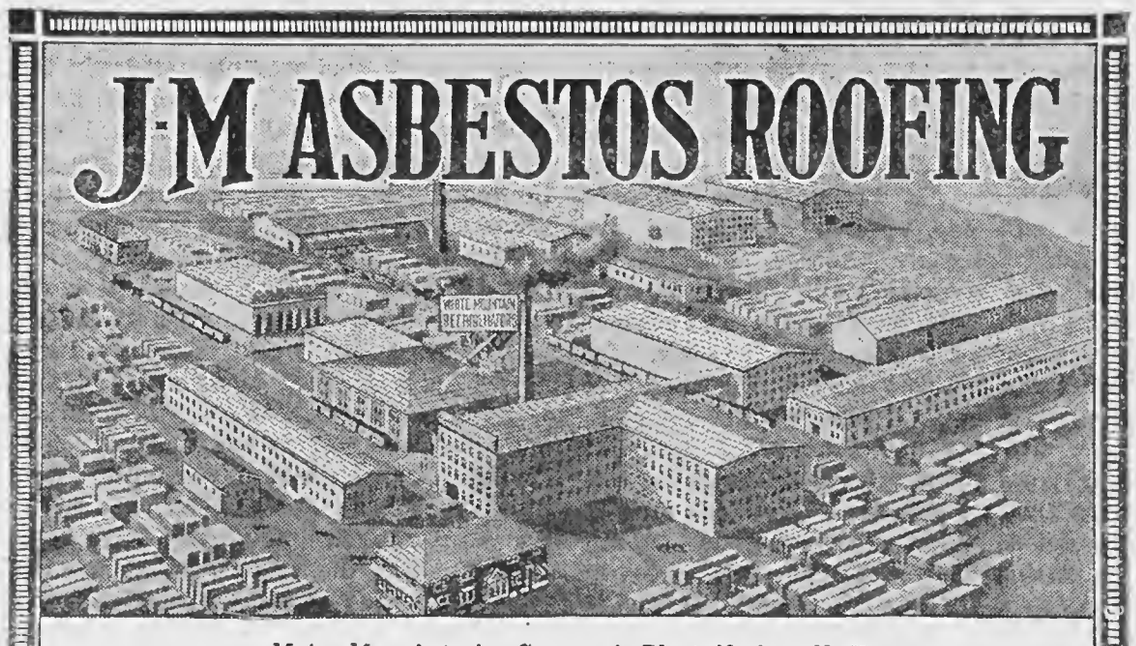
Care of Neglected Orchard.

We have an old Bartlett pear orchard (about 35 years old) that has been neglected until new growth, such as suckers, have thickly grown, some 1½ inches in diameter. In pruning this we cut out all the dead wood and as little of the new growth as was possible (some has borne fruit). The old wood was thickly covered with scale, which was killing the trees. We are now thoroughly spraying with lime-sulphur, one to 11, saturated solution. Was this the proper procedure?

Hightown, N. J. C. M. S.

It would seem that the pruning was done properly, for all dead wood is not only worthless but a positive injury. As the trees have been neglected for a long time there would be little need of heading back the growth, but there would be some useless branches that should be taken out to let in the sunlight. The spraying with lime-sulphur is the best thing known for killing scale insects, and it is also good for killing the germs of some of the fungus diseases. The Summer spraying for Codling moth larva, scab, etc., would come next and must not be neglected. H. E. VAN DEMAN.

"My dear one," said the young man, "I should like to ask you to marry me, but I cannot for a long, long time, I fear. Two people would starve on my salary." "O, George!" said the beautiful young girl, throwing her arms around his neck, "don't let that worry you for a minute. I'm a militant suffragette, and have been on four hunger strikes." Woman's Journal.



Maine Manufacturing Company's Plant, Nashua, N. H.
One of the Largest Refrigerator Factories in the World. Covered with J-M Asbestos Roofing.

Not a Cent For Paint or Repairs In Twenty Years

The great plant illustrated above was covered with J-M Asbestos Roofing twenty years ago and in all that time it *has not cost a cent for maintenance.*

A remarkable record. But not exceptional for J-M Asbestos Roofing. This roofing has given similar service for fifteen to thirty years on hundreds of factories, barns, and buildings of all types.

J-M Asbestos Roofing never requires coating, gravel, or any other form of protection—because it contains nothing to deteriorate. Made of Asbestos (rock) fibres and Trinidad Lake Asphalt—both minerals.

Literally a roofing of pliable *stone*, with all the qualities of stone. Gives perfect fire protection. And is not affected by heat, cold, salt air or chemical fumes. Lower in first cost than tin, slate or shingles. *The cheapest of all roofings on the cost-per-year basis.*

J-M Roofing Cleats, packed in each roll, make joints absolutely water-tight. And as they eliminate the smearing of seams with black cement, they give the roof an unbroken, handsome white surface.

Furnished in ready-to-lay and built-up form. Sold direct if your dealer can't supply you.

Where Men of Ambition Prosper

NOWHERE is ambition rewarded more generously than in the Southeast. Small capital and energy will accomplish wonderful results for you in this favored land.

Dairying, trucking, fruit growing, poultry raising and general farming are making Southern farmers independent.

Land from $15 an Acre Up

Plenty of rain and ample sunshine every month, irrigation unnecessary. Growing season from 7 to 10 months duration. Two and three crops raised annually. Local markets plentiful and profitable. Early vegetables and fruit bring high prices in Northern cities.

Modern schools and highways, good churches, rural telephones, healthful climate and delightful summers and winters make the South the most desirable location in America for Homeseekers.

Learn How to Make Money

Send for the "Southern Field" magazine, booklets and farm lists which give the whole facts.

1913 RECORD *Magnificent Crops in all Western Canada*

All parts of the Provinces of **Manitoba, Saskatchewan and Alberta**, have produced wonderful yields of **Wheat, Oats, Barley** and **Flax.** Wheat graded from Contract to No. 1 Hard, weighed heavy and **yielded from 20 to 45 bushels** per acre; 22 bushels was about the total average. **Mixed Farming** may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, **Western Canada carried off the Championship for beef steer.** Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

THE USE OF COMMERCIAL "HUMUS."

Utilize Your Own Supply.

PART I.

BAGGING DIRT.—Some 25 years ago an Eastern man went to a Western State to talk on Eastern farming. He saw what to him were wasteful methods of handling that rich and fertile black soil. He told his hearers, among other things, that their soil was rich enough to be used as a fertilizer; that they might scoop it up and put it in bags, and sell it to Eastern farmers. This made a great uproar among his hearers. Then he went on to say that within 20 years this black soil would actually be scooped up, mixed with soluble chemicals, sent to the East, and used to produce more profitable crops of corn than the Western farmers could grow. Of course the audience laughed at him, and greatly enjoyed the joke. Then he went on to tell them that a Connecticut Yankee would buy a bushel of Illinois corn, feed that to hens in an apple orchard, save half of the manure in the henhouse, mix that manure with chemicals, and with the mixture raise another bushel of corn, which would be worth twice as much as the Western corn, while the other half of the manure would grow a bushel of apples, worth from two to three times as much as the original corn. Of course, those Western farmers put this man down as a blow-hard from Cape Cod, yet the time has come already when most of these things are being done. The Connecticut Yankee and the hen are certainly going through this corn performance to a finish, and producing the corn and the apples as stated, with the eggs and then the fat hen thrown in for good measure.

SELLING BLACK SOIL.—For the past half dozen years or more, black soil from the Western swamps has been scooped up and dried and used as a filler in the mixing of chemical fertilizers. More than this, within the last few years there has come upon the market in the East a number of forms of so-called "humus," which are offered for sale as a substitute for manure, as a fertilizer or as absorbents to be used in stables. All these developments show how scientists and farmers alike, in the Eastern part of this country, are scouring every nook and corner for plant food, in their effort to provide suitable manure or fertilizers for farm and garden use. The introduction of these forms of humus complicates the fertilizer situation considerably. It is possible for the dealers in this class of matter to tell very large stories, or at least make large suggestions about the value of their stuff. Our farmers have come to the point of buying their plant food on the basis of a chemical analysis, and most of them are familiar with the words nitrogen, potash, and phosphoric acid.

MISLEADING CLAIMS.—When therefore a form of humus is offered them, showing an analysis of three or four per cent. of nitrogen many of these farmers think at first that they are offered a great prize. When they are told that because a humus contains 3% of nitrogen it is four or five times as valuable as stable manure, they think they have a very plausible excuse for buying the new material. As a matter of fact, there are 10,000 and more farmers in New England who have pond holes or muck swamps containing five acres or more. The black stuff to be found in these low places is in many cases richer in nitrogen than the humus which is offered for sale at a big price per ton. We do not hesitate to say that farmers who own these pond holes and swamps can haul this muck up to a dry place, mix it thoroughly with slaked lime, work it over once through the Winter, and at the end of six months have as high a quality of humus as is offered for sale by most of the leading companies. In Vermont, several samples of muck were found which contained over 4% of nitrogen, and such muck limed and sweetened as we have mentioned, would be worth more to a farmer ton for ton, than the black soil which is offered him in bags at a good price per ton. Yet any farmer who has used fertilizers freely would know that the 80 pounds of nitrogen found in a 4% ton of this swamp muck, would not give him anything like the result to be obtained in 80 pounds of nitrogen, in nitrate of soda, or dried blood; 100 pounds of nitrate of soda, for example, will contain 16 pounds of nitrogen.

PLANT FOOD VALUE.—What farmer would be so foolish as to imagine that a ton of the dried muck soil, or humus, would give the returns on his crop which 500 pounds of nitrate of soda will surely give? Yet in offering these brands of humus to the public, the manufacturers seek to have it understood that a pound of their nitrogen is worth as much as a pound in manure or chemicals. They will deny making any such claim, yet if we read their literature we will see that the average buyer gets the impression that their material is three or four times as strong as manure, which is the standard that most farmers have for the purchase of plant food. During the past few years our experiment stations have recognized the weakness of confining the analysis of a fertilizer to only one form of nitrogen. There was a time when the experiment stations in their reports simply stated that a fertilizer carried two or four per cent. of nitrogen as the case might be, making no distinction whatever with regard to the quality or solubility of that nitrogen. Now, however, by common consent, and by law, they give not only the total nitrogen, but they state the different forms in which this nitrogen appears. Thus they state the amount present as nitrates; also the amount as ammonia, and they divide the organic nitrogen into two or three different classes, and they carefully tell farmers that whenever the so-called inactive organic nitrogen represents one-half of the total, it is not good economy to buy the material. This we consider sound advice, and it should be taken in the purchase of the black soil or humus now offered for sale.

An Old Man's Tree Planting.

On page 355 I have read with much pleasure the remarks of I. K. under the head of "Fruit Planting at Three-Score." It moves me to give some of my experience. I always had a love for fruit growing since I was old enough to love fruit to eat, but was not so conditioned that I could indulge my desires that way, except in a very small way, until I had reached the age of 65 years. Then I planted a peach orchard of several hundred trees. These trees grew up, did their duty and died of disease, old age and the ax; the ground they occupied has now another orchard on it of apples and peach set in 1906. The peaches are fillers and are in their prime. The apples are Baldwins, and many trees—they are standards—began bearing in 1912—a few fruits. Last year quite a number of barrels of very fine Baldwin apples were gathered in the orchard. These apple trees were set when I was 78 years old. I had set some apple trees when I was 73 years old—or young—and was told, and I thought most likely true, that I could not expect to eat of their fruit. But these trees have borne—some of them—three full crops of fruit, two to four barrels per tree. I said when told that I should never eat of their fruit, that I ate apples when a boy, from trees that some other man had set, and I wanted to set trees for some other boys to eat the apples. I have been fully repaid for my labor in the pleasure and recreation of caring for and seeing the trees grow, and I have been paid again in the hountiful harvests some of them yielded. Two years ago—I was then 84—I set a four-acre orchard of apple and peach. It is doing finely and I think someone—some boy perhaps—will have the pleasure of eating fruit from it. Yes, I will say to those of three score or more, do not hesitate to set fruit trees, peach, apple or other kinds, from fear that you may not eat of the fruit. And do not confine your settings to dwarfs; standards are better. Somebody set trees to bear apples for you to eat when a boy, and it is only fair that you provide for pleasure of other boys after you. If you love trees you will get full pay for your work in the pleasure of the work and imagining some boy smacking lips when biting into the luscious fruits.

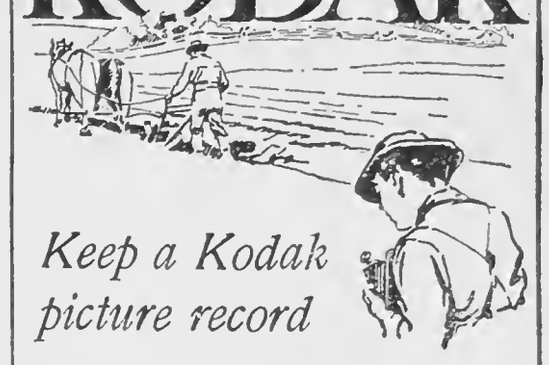
Massachusetts. MONROE MORSE.

The Maple Sugar Season.

Look over the maple sugar making outfit now. See the pails are all right, see the pans are in good condition, and the bricks are all in place in the arch, and the evaporator is ready for business. Some sugar makers will wait until the last minute, then hurry to the hardware man or the tinner for new equipment or for repairing. A hardware man told me that if he could have the possible business in repairing a month earlier than the maple sugar season, he could do more efficient work, and the producers would save dollars by not having to wait their turn.

If you must secure new equipment this year, secure good. Good tin is best for buckets, I am told, and also for pans, but be sure it is good, and it costs. The best is none too good however. I am told that there is a certain chemical action in a galvanized pail which is exerted between the galvanizing and the sap, which might be injurious particularly to the life of the pail. That is why some declare a tin pail is better. Anyhow be ready for the run which will come in a week or two in some localities and in others perhaps a month yet. W. J.

KODAK



Keep a Kodak picture record

of your methods of drainage and tillage and of your growing crops—with and without fertilizers. Such a record will enable you to study and improve the conditions governing their growth and will help you to better profits next year.

Let the Kodak at $6.00 and up, or the Brownie from $1.00 to $12.00 keep the record.

Planet Jr.

No. 28 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator, Rake and Plow

The newest and most accurate Planet Jr seeder. Sows all garden seeds in hills or drills, opens the furrow, covers, rolls down, and marks next row all at once. Has steel frame and handles, and complete set of attachments. Light enough for woman's use.

No. 25 Planet Jr Combined Hill and Drill Seeder, Double Wheel Hoe, Cultivator and Plow

A capital implement for large-scale gardening especially. It has a steel frame, and complete seeding and cultivating attachments. The hoes run close to row without danger to leaves or roots. Two acres a day can be worked with this tool.

Planet Jr 12-tooth Harrow, Cultivator and Pulverizer

An invaluable tool in the market-garden, truck and strawberry patches. Has new steel wheel which prevents clogging. Its 12 chisel-shaped teeth cut out all weeds, stir and mellow the soil and leave the ground in the finest condition without throwing dirt on plants.

No. 30 Planet Jr Single Wheel Hoe, Cultivator, Plow, Rake and Marker

A new Planet Jr Single Wheel Hoe that is light, strong and practically indestructible—the frame and handles are steel. It is completely equipped for plowing, hoeing, cultivating, and raking. The marking attachment insures rapid, economical wheel-hoeing.

No. 10 Planet Jr Horse Hoe, Cultivator, and Hiller

Does more and better work than any other horse-hoe ever invented. It is light and easily handled, yet unusually strong. Has new steel wheel which prevents clogging with trash. Quickly adjusted to rows up to 3½ feet apart. Vine-turner attachment is great for many crops at last workings.

The Home Acre.

Fertilizing a Garden.

I have a small lot containing 8,000 square feet, which I use for a garden. In the last six years I have spread stable manure, covering the surface two inches deep, three times; have turned under Scarlet clover twice, and cow peas once. Besides, I spread hen manure three times, ashes, 30 bushels to acre, last Fall and another light spread of stable manure; used two sacks kainit last year on potatoes and other garden truck. Will you advise the best manure or fertilizer for potatoes and other garden truck this year? The land is in good shape. Soil is stiff and not clay. I was thinking of putting lime at the rate of 40 bushels per acre after the land is plowed this Spring. Last year's tomatoes rotted before maturing, and other vegetables seem to burn. J. M. W.

From what you say it seems that you have got your garden into a one-sided condition. You have an excess of nitrogen as compared with the mineral matters, which are mainly engaged in the maturity of seed and tubers. Now I cover my garden with manure every year, but I try to balance the ration by supplementing the nitrogenous manures with an abundance of phosphorus and potassium. After manuring the garden I make a mixture of four parts acid phosphate and one part sulphate of potash, and apply this at rate of 1,000 pounds an acre after turning under the manure. This is well worked into the surface soil. I would not use lime on the garden, as some vegetables are injured by it, and soil that has had so much manure is hardly acid enough to need lime. Lime will make green peas hard to cook, while it might possibly help the plants. Lime will cause the conditions in the soil to become favorable to the growth of the scab fungus on Irish potatoes. Keep on manuring, but also keep on with the acid phosphate and potash and you will be surprised at the increase in the crops.

Maryland. W. F. MASSEY.

Waterproofing Muslin for Frames.

Will you give formula for waterproofing muslin? I wish to make a test between glass and muslin sash for raising plants. I have 50 yards of 81-inch muslin. Give full information how to proceed and the quantities for this amount of material. G. M.

Fairton, N. J.

The following formula is used for waterproofing muslin as covering for frames. Old pale linseed oil, three pints; sugar of lead (acetate of lead) one ounce; white resin, four ounces. Grind the acetate with a little of the oil, then add the rest, and the resin. Heat carefully in an iron kettle, over a gentle fire. Apply with a brush, while hot, stretching the muslin over the frame or sash. It is not possible to give amount of paint required with any accuracy, as it not only soaks in more freely on the muslin than ordinary paint on wood, but there is also likely to be some wastage in applying. In ordinary painting the common rule is to divide the number of square feet of surface by 200, the result being the number of gallons of liquid paint required for two coats.

Planting Time for Vegetables.

Will you inform me the dates when to plant the following in New Jersey, five miles from Philadelphia: Sugar corn, corn, peas, beans, potatoes, tomatoes, cabbage, oats, watermelons and muskmelons, sweet potatoes, carrots, cucumbers, kale, spinach, turnips, green pepper, yellow onions and eggplant. M. J.

Merchantville, N. J.

In the normal seasons, the first early sweet corn is usually planted in latter part of April, and must be of some small growing sort, such as Early Adams, Cory or Minnesota. About the first of May, a second planting should be made, and at the same time a planting of Crosby or similar variety, and Country Gentleman or Stowell's Evergreen should be made. Successive plantings of some good sort should be made at intervals of 10 days or two weeks, until July 10 to 15 for late kinds, and may be prolonged until August 5 to 10 if early sorts are planted. Field corn may be planted May 15 to June 1.

Peas.—The round sorts may be planted as soon as the ground can be worked; at the first planting two or three varieties that will immediately succeed each other should be planted, or a succession may be had by planting the same variety at intervals of one week. Plant the wrinkled sorts about May 1; successive plantings of these sorts should be made up to the middle of June. Bush beans—The first planting of these may be made April 25 to May 1.

Pole beans should not be planted until the ground becomes thoroughly warmer, or until a night temperature of about 60 degrees is reached, this rule applies to all kinds of pole beans.

Potatoes.—The first planting for very early use, may be made as early as the ground can be prepared. For main crop, plant middle of April to May first. These should be ready to harvest by middle of August, when the ground may be used for late turnips, peas, beans or any other crop that will come in before frost.

Tomatoes.—Sow the seed in the hotbed about the 15th of March, set them out as soon as a night temperature of about 50 degrees is reached, which will be May 15 to 20. For late tomatoes sow the seed May 1 and plant in the field soon as ready.

Cabbage.—Early sorts, should be sown in the hotbed first to tenth of February, when plants make their second pair of true leaves; give plenty of air to harden them. Plant to field soon as ground can be worked. Sow late cabbage in a well prepared seed bed in the open, tenth to fifteenth of May, plant to field soon as large enough, which will be June 20 to July 1.

Watermelon and Muskmelon.—Plant as soon as a night temperature of 60 degrees is reached, which will be about the last of May.

Cucumbers.—Plant seed in well prepared hills May 10 to 15. For late pickles, plant August 1.

Kale.—For Fall use, sow the seed about May 15; for use the following Spring, sow the seed September 1.

Sweet Potatoes.—Bed the potatoes in a warm bed about April 1, plant sprouts to field, when the trees are well advanced in leaf.

Carrots.—First sowing may be made middle of April, which may be followed by successive sowings, at intervals of a month to July 15.

Spinach.—Sow soon as ground can be prepared. To be followed by later sowings at intervals of 12 to 14 days, up to May 25.

Turnip.—For early use, sow in April. For Fall and Winter use, sow August 1 to 15.

Peppers.—Sow seed middle of March in a well-prepared hotbed. As soon as the night temperature reaches 60-65 degrees they should be planted out.

Eggplant.—Sow seed in warm hotbed, about the last week of March. Plant out about June 1.

Onions.—Seed and sets may be planted as soon as the ground is in good working condition. K.

Planting City Lots.

The firm of Ellwanger & Barry has, during the last few years, built a large number of small houses on city lots in Rochester. These houses have been made suitable for small families, and the yards are left so as to provide some space for embellishment. Some of these backyard gardens have been fitted up in a very artistic manner, providing good models for similar work in other places. Mr. Wm. C. Barry has sent us the following notes, showing what is done with these lots, and suggestions for an outfit of fruit trees suitable for this work. We hope later to have pictures of some of the lots to show our readers.

"These lots average about 40x100 feet, the houses are about 26x28 feet, so that there is not great space for planting, but yards both front and rear have been made attractive by judicious planting. The purchasers of the property are allowed to make their own selection up to a certain amount, and there has been great rivalry as to who would have the best looking place. I enclose a list of trees and shrubs suitable for planting a place like those described, the cost of which would be about $15 to $20: One dwarf apple; one dwarf pear; one peach; one cherry; six currants; 12 raspberries; one dwarf evergreen; one maple or other ornamental tree; 12 shrubs; six roses; three paeonies; 100 California privet or Berberis Thunbergii for hedge."

Insure Your CORN CROP

against the lack of available plant food in the soil by the use of

Hubbard's Bone-Base Soluble Corn and General Crops Manure

Don't be content with the average yield of 40 or 50 bushels of corn per acre, when by co-operating with Nature you can obtain 90 or 100 bushels.

Nature alone cannot meet the enormous demand for the food which a big crop requires. You must co-operate, by furnishing the growing plants with a *high-grade, well-balanced, available* fertilizer like Hubbard's "Bone-Base" Soluble Corn and General Crops Manure. This fertilizer has put many other farmers into the "100-bushel-per-acre" class, and it can do the same for you.

Broadcast your fertilizer for the Corn Crop. It is the only common sense way.

Write today for our booklets, **"Insure Your Corn Crop," "Soil Fertility," "The Grass Crop," "The Apple,"** and **Hubbard's Bone Base 1914 Almanac,** which contains much valuable information about soil, fertilizers and other farm subjects. Sent free to any address.

SEEDING ALFALFA.

I have about four acres of sandy loam, which has been mown for years and the meadow run out. It is in fair state of cultivation. Will you give me instructions for plowing the field and sowing Alfalfa this year? I desire also 8½ acres which was sown to oats two or three years by renters without seeding. I raised a fair crop of potatoes last year on the piece, but harvested too late to sow to wheat and seed. Could this be seeded to Red clover in the Spring with any degree of success? If not tell me the next best step. V. M. H.

Cuyahoga Falls, Ohio.

Cover the worn-out meadow with good barnyard manure and apply two tons per acre of ground limestone rock, the latter preferably, being put on just after the ground was plowed and not plowed under. We would wish the rock to be mixed with the top four inches of the soil in order to correct acidity, which would probably be present, and thus benefit the little Alfalfa plants when they were just gettng started rather than to have it plowed clear under, in which case the plants might suffer from acidity for some time before the lime could benefit them. In addition to these, 200 pounds per acre of steamed bone meal or of basic slag should be used. A larger application even than this would be an advantage, and would not require to be renewed as often as the lighter application. We would prepare a good seed bed and during the first half of April would seed the Alfalfa, using 20 pounds per acre of good seed, with one bushel of beardless barley. After removing the barley the field might require clipping once, but this should be done not later than September 1. The other field could be handled in just the same way, excepting to substitute the clover seed for Alfalfa.

CHAS. B. WING.

THE CULTURE OF HORSERADISH.

Will you tell me about the culture of horseradish? My soil is a clay loam with yellow clay sub-soil, in a good state of cultivation. I plowed a nine-inch furrow, then followed with a one-horse plow and turned four inches in the bottom of the first furrow. The ground had been in corn the year before, and I plowed under a good coat of manure. I furrowed as for potatoes, dropped six or eight-inch pieces of roots the size of a lead pencil, and 18 inches apart. The roots I gathered in old gardens, and were never cultivated but rather fought. I covered the roots three or four inches deep, and cared for them the same as I did for my corn. The tops were immense, they stood above my waist, dark and thrifty, but when I come to dig it all I had a mass of lateral roots. I weighed some single roots that went over eight pounds and had a spread of four feet, but there would not be over a pound of salable root. Was it a fault of soil, fertilization, roots or culture? D. R. B.

Pittsfield, Pa.

This crop requires a deep rich soil such as is found in the best market gardens of the country, and being naturally a swamp plant, if the land is inclined to considerable moisture all the better. Horseradish cannot be grown into first-class marketable roots on ordinary farm land the first year, no matter how well it may be manured. I think your land, however, was rich enough, but the manure was too raw, which supplied an excess of nitrogen. I judge this to be the case from the rank growth of top and root, but your manner of planting was greatly at fault, which at least accounts in part for the great spread of lateral roots.

In the vicinity of New York and Philadelphia the market gardens usually grow horseradish as a second crop, either with early cabbage, cauliflower or beets, and the planting is performed in the following manner: If planted with cabbage, the ground is lined off in rows 12 to 15 inches apart and the cabbage is planted in every alternate row. The planting of the cabbage is accompanied first, when the rows left vacant are planted to horseradish about 16 inches apart in the row, done in the following manner: With a sharpened stick about the thickness of a rake handle or a small iron bar, a hole eight to 10 inches deep is made, into which is dropped a small root six to eight inches long. This will bring the top end of the root two inches or more below the surface of the ground. With the foot, draw fine soil in over the root and press it down as in setting any other plant. As it is not desirable to have the roots make any top growth until the crop of cabbage is cleared off, the deep covering of the root will be an advantage in delaying the pushing up of tops, and if any should push above ground they are to be chopped off with the hoe and treated same as if they were weeds. This chopping off the top growth will in no way interfere with the making of the crop, as it is in the latter part of Summer the plants make their principle growth. After the cabbage has been cleared off in July the horseradish should be allowed to grow at will. About one good cultivation will be all that is necessary, as the leaves will cover the ground and, smother out practically all weeds. The horseradish being very hardy, it need not be dug until very late, and may be left in the ground until December, if the Winter is open enough to admit of digging the roots. The planting of the roots should not be done earlier than May first. If the land is in good tilth and the season favorable the plants will produce salable roots weighing from three-fourths of a pound to one pound each.

In the preparation of the finished product for market it should be grated fine and be entirely free from discoloration and woody substances. To accomplish this each root must be thoroughly washed and scraped clean of the outer skin or bark. This will leave the root nice and white and when grated and bottled presents a very attractive appearance, which helps very much in the ready sale of it at a good price. All that is necessary to prevent it from spoiling is to cover it with pure cider vinegar (never use malt vinegar) and tightly cork the bottles. K.

OHIO HORTICULTURAL NOTES.

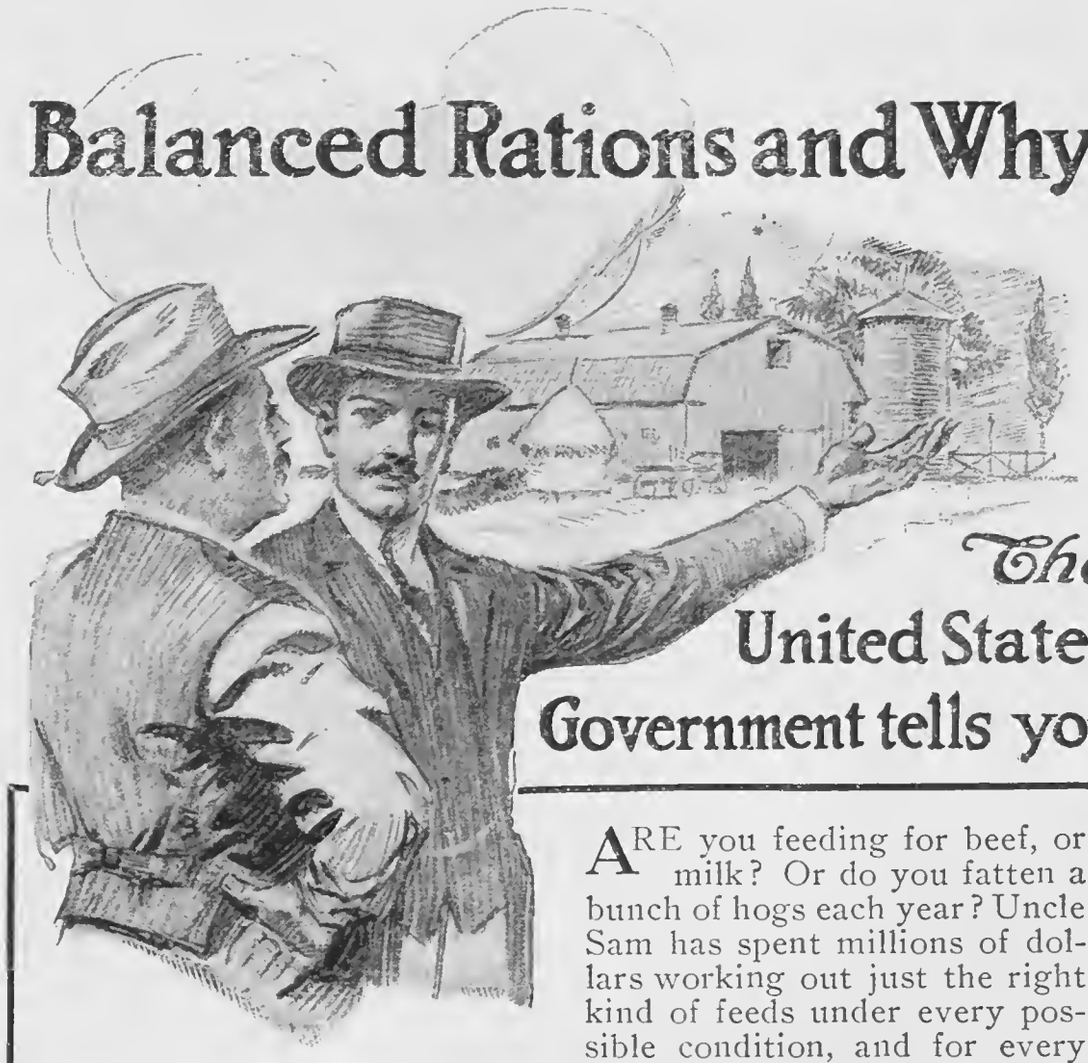
"Get a good sprayer, get one that will not go down on your hands. A day or two in spraying time will cut from a grower's bank balance, the price of the best outfit on the market," is the opinion of W. W. Farnsworth of Ohio. "No grower can afford to take a chance on a poor outfit, there are quite a number of good outfits on the market, the engine must be reliable, the pump must be efficient, and when it comes time to use it, the work must go along without a hitch. It will pay a man to go over his outfit, test it, have everything in readiness, and when spraying time comes, the work may go along without hitch or bother. It pays to be ready."

The practice of the Farnsworth Bros. of Ohio is interesting. They raise potatoes each alternate year in their orchard. After the potatoes are removed they level the field, seed to rye, and in the Spring seed the rye down with clover. They cut the rye before maturity, use a side delivery rake and turn the rye up under the trees. They aim to cut clover that year and handle in the same manner. This provides mulch and a supplementary crop is secured each alternate year.

The question of utilizing the soil while an orchard is developing is one that faces many horticulturists. W. N. Scarff of Ohio, describes this method which has been used by them: "Nine years ago we had an orchard of Montmorency cherries. We established this orchard in the Fall, and at the same time planted currants in the cherry tree rows, and three rows of currants between each row of cherry trees. The cherry trees were set 18x24 feet. In the Spring we set out strawberry plants between the rows of currants. These three crops came along very nicely, and in the Fall we had a good growth of strawberries, and the next year and the following year secured good crop. After two years we cut the currants down for cuttings to supply our nursery trade. Our returns came quickly, we found that we received about $100 the acre income from the system. We have received good rental for the ground, pay for our labor, interest on investment, and were out our money and labor only one year. This year we established five acres of blackberries, and between these we planted sweet potatoes. Had we established an apple orchard on this ground, the three plantings would have come along nicely."

Ohio apples must be advertised. This is the opinion of horticulturists in the Buckeye State, and for that reason the Ohio Apple Growers' Association has been organized. The Farnsworth Bros. of Lucas county were among the first to see the need of the association, and at the State Horticultural meeting in the Summer of 1913 held at Toledo and at their farms, the matter was discussed and preliminary arrangements made. The horticultural meeting held in connection with the Ohio Apple Show at Cleveland witnessed the final completion of the organization. The policy of the association is to establish sentiment in favor of better pack, create interest among Ohio consumers for Ohio fruit, secure orchard inspection and packing demonstrations, and to secure the assured aid from the State. In Cleveland less than 10 per cent. of the apples consumed were from Ohio trees, and the State of Ohio was producing but one-third the apples that were consumed. W. J.

Balanced Rations and Why



The United States Government tells you

ARE you feeding for beef, or milk? Or do you fatten a bunch of hogs each year? Uncle Sam has spent millions of dollars working out just the right kind of feeds under every possible condition, and for every desired result, and all he found out is at your service in the

Farmer's Cyclopedia

Abridged Agricultural Records

SEND the coupon without money for the whole set on approval, and if it's worth many times its low price to you, pay for it in little monthly payments.

All the books in the world may not be able to teach a man how to plow a straight furrow, but a feed formula from a Government Bulletin can make a difference of $2 a head in the profit on hogs. That's how Ned Hicks worked it out. Ned had rather scoffed at "book farming." Fed his hogs on cornmeal and ear corn, like everybody else in the neighborhood. Cost him about six cents a pound to put on a hundred pounds during the fattening season.

One day Ned read up on protein. And that year he fed his porkers cornmeal and ear corn PLUS bloodmeal. It didn't cost him any more, because he cut down on the corn, and it resulted in a gain of 150 pounds per porker, instead of 100 pounds, as formerly. When Ned finally figured it out, he found that he had made a profit of $2.65 per pig with the new way of feeding, as against fifty to seventy cents a head profit in the old days.

Nowadays Ned ALWAYS reads up on such things as feeding, or fertilizing, or seed selection. IT PAYS.

They Would Cost You $4,000 a Set

EACH year the Department of Agriculture spends millions of dollars in experimenting and collecting information. Valuable as it is, no human being could read it all. It would take 20,000 volumes—a whole house full of books to hold it all. And it would cost $4,000 to bind and put them into shape. At that it would be full of technical matter and things you wouldn't care about.

The Department of Agriculture Helps

A YEAR or two ago a group of agricultural experts came to realize this situation and resolved to select the most authoritative and up-to-date matter on all topics of interest and importance to the farmer and country dweller—and nothing else. The Department of Agriculture and the State Experiment Stations did all in their power to forward the enterprise. The result you have here.

Each Minute You Spend With It Worth $5 to YOU
7 Big Thick Volumes

EACH volume 6x9 inches and 1⅝ inches thick. Bound in strong imported buckram with gold backs, title pages in 2 colors—more than 5,000 pages—thousands of illustrations—photographs—diagrams, line drawings, sketches, plans, 3,000,000 words—a special cross index so you can find what you want at a glance,—and every word worth money to you. Every word of the 3,000,000 will come back in bigger crops, more product per acre—more money—and less work.

Some of the Subjects Covered:

Breeds of Horses
Mules
Breeds of Dairy Cattle
Milk
Breeds of Beef Cattle
Sheep
Breeds of Swine
Poultry Keeping
Other Animals
Diseases of Horses
Diseases of Swine
Health and Disease of Poultry
Grass and Hay
The Vegetable Garden
Field Crops
Various Farm Products
Miscellaneous Crops
Horticulture
Pome Fruits
Stone Fruits
Forestry and Conservation
Floriculture
Other Farm Crops
Entomology
Diseases of Cultivated Plants
Farm Management
Special Farm Topics
Soils and Fertilizers
Home Economics and Education
Agricultural Education
How to Run the Farm Like a Business
How Much it Costs per Acre to Grow Various Crops
How Soils are Made and How They Can be Modified and Improved
How to Design Attractive, Convenient, Economical Farm Buildings
What Most People Do Not Know About Feeding the Human Animals
What the Farmer's Wife Should Know About Pure Food, Drugs, Sanitation, Etc.

SEND NO MONEY

Whole Set on Approval—Send the coupon. It will bring you the complete set—the whole seven volumes—all charges prepaid on approval. Look them over at your leisure. If you don't find in them ideas for more money and less work, if you don't find you'll get your investment back many times from its pages—send the books back *at our expense*. Otherwise send $2 a month for 11 months. But act quickly or you may have to wait six months for your set. Send the coupon to-day.

With Country Life in America for One Year

As a monthly addition to the Farmer's Cyclopedia to keep you informed right up to the minute on the latest knowledge about farming, a year's subscription to Country Life in America is included in this offer. Country Life will contain each month articles on THE BIG BUSINESS OF FARMING—BETTER STOCK—POULTRY—A TRUE STORY OF A TRUE FARM BY A TRUE FARMER — Regular price $4—a year's subscription—included in this offer.

Hope Farm Notes

THE HOPE FARM SCRUBS.

As Eaters.—There has been some controversy about the food which a hen will consume and the cost of feeding her. The Hope Farm plan for gathering statistics is to go right to your own property or companion when you want information.

"He is of age—ask him!"

I shall keep on repeating that text through the year, for it is the foundation of investigation and thought development. Thus we will ask the 10 scrub or "cull" hens in the laying contest at Storrs. I confess that we do not weigh and measure the food given to our hens at Hope Farm, but at this contest the grain and mash are weighed down to the fraction of an ounce. Prof. Kirkpatrick sends me the following statement of what the Hope Farm scrubs were guilty of during the first four months of the trial.

Statement of food consumed by pen No. 78:

Week Beginning	MASH LBS.		GRAIN LBS.	
November 1	5.0		6.6	
November 8	5.2		5.0	
November 15	5.1		5.0	
November 22	3.4		9.6	
November 29	4.4		7.2	
		23.1		33.4
December 6	4.5		4.0	
December 13	1.7		6.0	
December 20	6.0		6.1	
December 27	4.6		6.9	
		16.8		23.0
January 3	4.0		7.1	
January 10	1.3		14.0	
January 17	2.5		9.4	
January 24	4.0		9.6	
January 31	12.0		7.3	
		23.8		47.4
February 7	4.4		12.0	
February 14	4.0		14.0	
February 21	4.0		16.2	
February 28	4.0		12.0	
		16.4		54.2
Total	80.1		158.0	

Figuring It.—This makes a total of 238.1 pounds of mash and grain. In addition to this these birds consumed charcoal, grit, shells and green food, which could not well be accurately measured. In carload lots the mash cost $31.75 per ton—the mixed grain $35. I think $1.75 per 100 pounds for the mash and $2 for the grain would be a fair price. Thus those scrubs consumed $1.12 worth of mash and $3.16 worth of grain, or $4.28 in all during 119 days. That means 3.6 cents per day for 10 hens, or a little over one-third of a cent per day for one hen. Figured in another way each hen averaged a little over one ounce of mash and 2.12 ounces of grain per day, with a total yearly cost of $1.30 per year for grain and mash. I will assume that these hungry scrubs consumed more than the well-bred, blooded birds—though I have no other figures now. As it stands, my scrubs were guilty of larceny during these first four months.

Robber Hens.—Look right at their record. They consumed $4.28 cents worth of feed and laid 61 eggs during these 119 days. That means a food cost of seven cents per egg. I figure that 16 of these eggs would have sold at four cents each, and 45 at three cents, or $1.99 in all. Thus these scrubs owed $2.29 on their feed bill on March 1. I can go through the 790 purebreds in this contest and find about 200 that make a worse showing than this, but the laugh is now on my scrubs. Now gentlemen, have a fine hearty laugh at the scrubs, and then listen to this. We are told that the thing to do when you find a robber hen or cow is to kill her at once. Make pie of her! Instead of doing that I will, even now, back these scrubs to pay a profit on their feed before the contest is over! If some of you laughers think you are "sports" here is your opportunity.

What It Means.—The odds may seem to be against these scrubs. They are for the most part inferior in breeding, and have made a bad start. The season for high-priced eggs is about over, while the feed will continue to be expensive. The instinct and breeding of the scrub will prompt her to lay a few eggs and then quit. Several of them may die with a large feed bill unpaid. Yet I will take these odds and back them to pay a profit over the cost of feed before the contest ends on November 1. I will also back two of them to give at least one dollar profit over the cost of their food. I never bet on a horse race or a prize fight or an election or any other "chance game," but I do not consider this as a bet. Frankly, I would like to help a very worthy school for young colored people at the South. It seems to me that a chicken contest would be a very appropriate thing for collecting funds for educating colored boys and girls. If anyone wants to help the cause of education and the poultry business together over this question of the ability of my scrubs to pay their board bill, I think they can be accommodated.

More Snow.—The weather is no topic for consideration in Northern New Jersey. There was another snowstorm on March 22, not enough to cover the bare spots on the road, but quite enough to make outdoor work a nuisance. A year ago at this time we could plow and dig strawberry plants. This year there will be little chance for doing either for several weeks. The manure can be hauled out, trees trimmed and spraying started. The Summer's fuel has been cut and piled in the shed, and now we wait for the snow to get off the berry fields. There is a trade in Marshall plants, and some customers to the south of us cannot understand why we do not dig and ship. Could they come and see the snowdrifts over these plants they would believe us. We are planning to set out over an acre of our own this year, and they should go in early. This planting will be on land which had mangels last year. It was a tough old sod, full of white grubs two years ago. Young hogs worked it over. It was plowed in the Spring and seeded to oats and peas. When these were cut, cabbage followed with rye seeded in September. This rye was plowed under last Spring and mangels were planted. With all this thorough working the white grubs seem to be killed out. We shall give it a good coat of cornstalk manure, plow deeply and set Marshall plants two feet each way in hills. This will give us a crop of potted plants and a crop of fruit next year.

Humus.—This question of cover crops and chemicals seem to me to get down to the foundation of our Eastern farming. The greatest need of much of our oldest land is humus or vegetable matter. I will not quarrel with the statement that manure makes the best humus, but when you can sell hay and straw at $25 or more per ton such humus comes very high. Then again, consider the cost of hauling manure up such steep hills as we have. I gave up hauling manure away from the lower farm levels long ago. Cover crops plowed in and limed do the business. Yet there are many who seem to dislike the thought that soil can be maintained in fertility without manure. I do not know why they should think so, but that seems to be their feeling. The little boys and I intend to start an experiment this year at making a fair soil out of coal ashes, if we can. We intend to take sifted coal ashes for a start and use enough lime or chemicals to get the first crop going. This will be turnips or radishes. They will be spaded under when fully grown and buckwheat and rape seeded. This will be spaded under in September and rye and vetch seeded. We shall use enough chemicals to start these crops well and spade them under as they grow large enough. We expect, with this treatment, to see the ashes slowly change to "soil," taking on color and character, ability to hold moisture and productive power. The great problem with many of our Eastern soils is how to stuff them with vegetable matter at a cost within reach of the average purse. Can we do it with coal ashes and not use manure?

Roots.—We have learned that one of the most profitable side crops we can grow is mangels. Our cows had no roughage all Winter except cornstalks and mangels, and they kept up their flow of milk until the roots were all eaten up. Then the cows fell away. These roots are fine for hogs and for hens or horses—in fact on a farm like ours, where the roughage is nearly all a waste product, roots of some sort are nearly indispensable. Of course yellow turnips can be grown as a second crop following peas or even grass, but they are not equal to the mangels for feeding value.

H. W. C.

THE MOST ECONOMICAL STUMP REMOVER IS

DU PONT

RED CROSS DYNAMITE

WHY?

BECAUSE

1. Any stump can be gotten out with it, no matter how large.
2. It leaves the soil behind. No long, hard work cleaning roots of dirt.
3. It delivers stump and roots split into pieces small enough to handle.
4. It clears an acre of stumps much quicker than by any other method.
5. If help is scarce you can do it alone.
6. The blasts mellow the subsoil, making plowing easy, and crops extra large.
7. No machinery or horses needed.

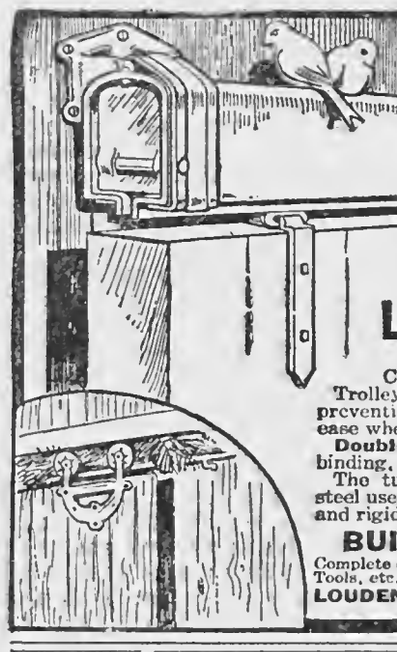
APOLLO

BEST BLOOM

GALVANIZED SHEETS

Highest quality and best known Galvanized Sheets manufactured. You should use no other for Culverts, Tanks, Silos, Roofing and Siding. APOLLO Roofing Products are sold by weight by leading dealers.

AMERICAN SHEET AND TIN PLATE COMPANY, Pittsburgh.



Always a Clear Track

In spring, summer, fall or winter—against ice, snow or rain; nesting birds or trash—you can always depend upon the

Louden Bird-Proof Barn Door Hanger

Roller bearing trolleys are completely enclosed in heavy steel tube. Cannot be clogged or derailed.

Trolleys operate on level tread, reducing friction to the minimum and preventing wedging or binding. Light and heavy doors roll with equal ease when fitted with the Bird Proof.

Double flexibility permits the door to fit snugly without sticking or binding, and lessens the probability of its being broken by crowding stock.

The tubular form of the Bird Proof Track, and the special grade of steel used in its manufacture, combine to give it wonderful strength and rigidity. Will not sag with heavy doors.

BUILT FOR DURABILITY AND SERVICE

Complete catalog of Louden Stalls and Stanchions, Feed and Litter Carriers, Hay Tools, etc., mailed on request. See Your Dealer or Write Us Direct.

LOUDEN MACHINERY CO., 2601 Broadway, Fairfield, Iowa.

LITTLE GIANT SPRAYERS

LIGHT

RIGS WITH LOTS OF POWER

No matter what kind of a sprayer you need we can supply you. Every Little Giant, from the Orchard power Sprayers to the Hand type, is so simply constructed and so mechanically right, that it gives the maximum of service with the least waste of effort and spray materials.

LITTLE GIANT

TANK POTATO SPRAYERS

The one man Outfits—are a triumph—Power is derived from either wheel thru chain drive from axle—The double action pump has a constant stroke—The clutch makes it possible to run the Pump only when needed for spraying. 65 gallon Cypress tank, brass piping, 4 or 6 row boom, pressure gauge, relief valve, are a few of the features. This sprayer can be used for

Field Crops, Weed Killing, Vineyard Work

with equally good results. It s the most economical sprayer for general farm use, and will pay for itself in a season. WRITE TODAY FOR CATALOGUE AND VALUABLE SPRAY CALENDAR.

Strawberries in Florida.

I am told that we can take strawberry plants of this season's growth in August or a little later to Florida, set them out and obtain a good crop by Christmas. These would be plants that would naturally produce fruit next June. Is this true and would the plan pay?
Michigan. J. M.

It will be all right to grow strawberry plants in Michigan and ship them to Florida for fruiting purposes, provided the right varieties are selected. The Klondike is the most popular berry in Florida at present, and Missionary probably holds second place—in some localities running first. The Brandywine was at one time the most popular berry, but now probably holds third place. The time these berries should be set out in Florida depends upon the region in which they are planted. If in the northern portion of the strawberry section they should be planted in the field about the first of October, or preferably during the latter part of September. Weather conditions, however, will dictate to a considerable extent. It is an advantage to have the field under irrigation, but there are only a small percentage of the fields now completely under irrigation. If the plants are ready it would probably pay to set them out during the latter part of August or early in September for producing the early berries, that is those that would ripen around Christmas time. The largest quantity of strawberries are produced well to the southward—around Plant City, Lakeland and Arcadia. I have fruited strawberries from plants grown in Illinois and North Carolina, also from Florida grown plants, and find very little difference; they all fruit abundantly, and very soon after being set out.

P. H. ROLFS.
Director Florida Experiment Station.

A Business in Flower Culture.

I wish to raise flowers for the market, but know nothing about the business. I live three miles from a railroad station; have about four acres of land suitable for flowers and water to irrigate. What kinds sell best, and would it be profitable to hire a man who understands the business? L. R.
Watkins, N. Y.

A person who wishes to grow flowers for market, yet admits no special knowledge of the business, has much to learn, and many possibilities for disappointment. Flower-growing is a highly specialized business. Not only cultivation, but handling for market requires skill; knowledge of desirable varieties must be secured, and high-grade strains of seed selected in classes depending on seed propagation. Such intensive culture as is practised in high-class truck farming is called for. A person three miles from the railway must also give thought to shipping facilities, and to the market he intends to reach; trains must be convenient to get his stock to market early in the day.

Before making any large venture into flower growing, the aspirant should either take a course in floriculture at the State Agricultural College, or else supplement his experiments on his own place by conscientious reading and study. We doubt whether hiring a competent man would work out advantageously where the employer was entirely untrained—it would be a difficult position both for employer and employed.

If L. R. has already had a fair amount of experience in intensive truck growing many of the difficulties suggested would be absent, since he would understand efficient tillage, fertilization, succession crops, etc. As no reference is made to glass structures, we infer he intends to grow outdoor flowers only. As annual crops Asters, Gladioli and Dahlias are standards for cut flowers, and they bear transit well. For permanents pæonies are excellent, also Achillea Ptarmica "The Pearl," and a few other herbaceous plants, but the latter give modest returns, as they are in when the market is low. Probably pæonies, Asters and Dahlias are the most promising. With the limited data given it is impossible to advise very effectively; we can only suggest an outline. The possibilities for irrigation which L. R. mentions give him one great advantage, as drought is a serious hindrance to field flower culture.

NEW YORK FLOWER SHOW.

The New York flower show, held in the Grand Central Palace March 21-28, was marked both by profusion of display and high quality of the exhibits. It was said that there were 1,250,000 flowers on view, which does not convey a great deal of information, though the fact that one Azalea plant carried 2,000 blooms gives an idea of its quality. The plant display included much of the class known to florists as Easter stock. The forced Spring shrubs were charming; they included lilacs of all classes, laburnum or golden chain, which suggests a yellow Wistaria; Japanese cherries, Forsythia, Spiræas, standard Wistarias, Genistas, etc. There were many of the new French forcing Hydrangeas, white, all shades of pink, from pale flesh to deep rose, and blue. These Hydrangeas make enormous trusses of bloom, and possess unusual value as pot plants; they are the work of European hybridizers. Among them Mme. Emile Mouillere, white with carmine eye, General de Vibraye, bright rose, and La Lorraine, pale pink, are especially noticeable.

The glorious displays of heaths and Acacias showed the renewed interest in what European gardeners call New Holland plants—hard-wooded plants, chiefly from Australia. One enormous bush of Erica melanthera was eight feet high and four feet thick, completely covered with its tiny flesh-colored bells. This is a heath from the Cape of Good Hope. Erica Cavendishiana, a hybrid heath with very showy yellow flowers, seems the only yellow form satisfactory to the American trade.

A very odd exhibit was of the Gloriosa, a lily with flowers resembling Lilium speciosum of our gardens, but growing like a vine, trained around a balloon-like support. The variety shown was a new one, G. Roehrsiana, with brilliant crimson flowers.

A quantity of fine Amaryllis (Hippeastrums) were shown, and a great variety of Dutch bulbs. But the roses always attract the general public and notable among these were the Ramblers shown as standards and other pot plants; Lady Gay and Hiawatha were especially good. A new American rose that attracted much attention was Hadley, deep velvety crimson, which has size, finish and fragrance, as well as a marvelous color. Killarney Brilliant, a great advance on the original Killarney, and White Killarney showed the value of bud sports. There was a vase of the Cherokee rose of the South, which attracted much attention. Irish Fireflame, vivid orange, and Mlle. Cecile Brunner, flesh pink, were two of the little roses that have become so fashionable for corsage wear.

Carnations included a remarkable new yellow from Indiana, Yellow Prince, and many other novelties. There was a fine display of sweet peas. The snapdragons, Cyclamens and primroses made a profuse showing, and the orchids deserve more description than we can give them. From the public interest shown in the exhibition it would appear that New York has really awakened at last to a genuine interest in flowers, after many years of patient missionary work on the part of commercial florists and private gardeners—another endorsement of the great principle of coöperation. E. T. R.

TO DESTROY APHIS, THRIPS, ETC.
WITHOUT INJURY TO FOLIAGE
SPRAY WITH
"BLACK LEAF 40"
(SULPHATE OF NICOTINE)
"Black Leaf 40" is highly recommended by experiment stations and spraying experts throughout the entire United States. Owing to the large dilution, neither foliage nor fruit is stained. Also, "Black Leaf 40" is perfectly soluble in water; no clogging of nozzles.
PRICES:
10-Pound Can $12.50
Makes about 1,500 to 2,000 gallons for Pear Thrips, with addition of 3 per cent. distillate of oil emulsion; or about 1,000 gallons for Green Aphis, Pear Psylla, Melon Aphis, etc., or about 800 gallons for Black Aphis and Woolly Aphis—with addition of 3 or 4 pounds of any good laundry soap to each 100 gallons of water.
2-Pound Can, $3.00 ½-Pound Can, $0.85
Write us for free leaflet giving spraying formulae
If you cannot obtain "Black Leaf 40" from a local dealer, send us P. O. Money Order and we will ship you by express at the above prices (for the United States), prepaying the expressage to your nearest railroad town in the United States. There is a duty charged on all shipments made into Canada.

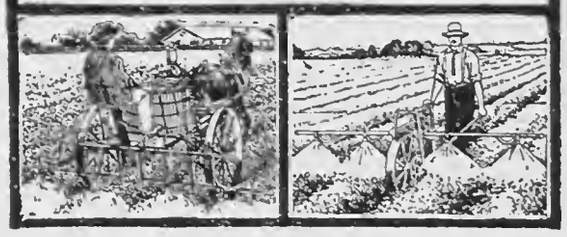
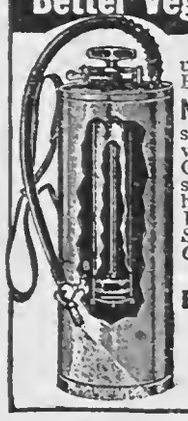
$57 EXTRA PROFIT From One Acre
HURST
The Vermont Experiment Station reports, "The average increase in yield of sprayed potatoes over unsprayed during a period of 12 years was 115 bushels per acre." At only 50c a bushel that's an extra profit of $57.50 per acre. It certainly pays to spray, but to do it quickly, cheaply and effectively you need a
HURST HORSE OR MAN-POWER SPRAYER
Made in 28 different styles and sizes to meet any condition in field or orchard. Sold on 10 days' free trial with 5-year guarantee. No freight to pay—no money down—no bank deposit—your own time to pay.
VALUABLE BOOK FREE
This book, "Why, How and When to Spray," contains 74 illustrations of insect pests and plant diseases with remedies for each and spraying calendar. Also shows our full line of sprayers and explains our liberal terms of sale. Tell us what size sprayer you need or what you have to spray and get the book and our big MONEY SAVING OFFER. Write today—a postal card will do—they are FREE.
THE H. L. HURST MFG. CO., 288 North St., Canton, O.

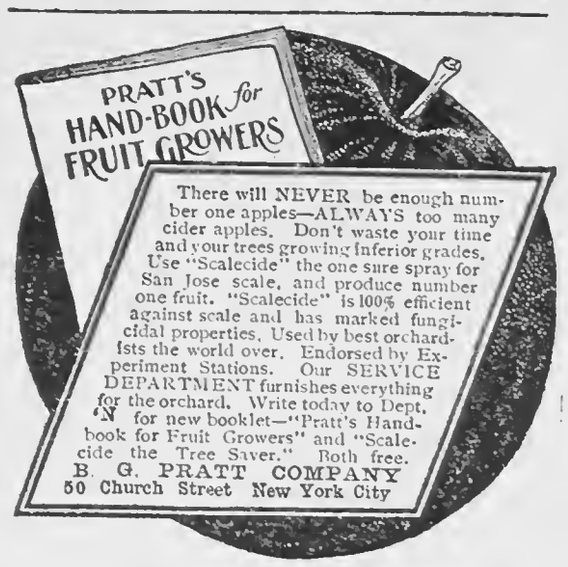


More-Finer Fruit
USE the quickest, surest, most economical method of spraying; preventing disease, blight; killing bugs; assuring bumper crops of finest fruit. 300,000 farmers, gardeners have found
Brown's Auto Spray
most efficient—Style No. 1 shown here. Capacity 4 gallons. Easily carried over shoulder. Does more work than 3 ordinary sprayers. Patented Auto Pop Nozzle—throws any kind of spray—does not clog.
Better Vegetables, Bigger Crops


Just the size for small trees, fields up to 5 acres, poultry houses, etc. For large sprayers—Brown's
NON-CLOG ATOMIC NOZZLE
sprays *any* solution without clogging. Guaranteed. 40 styles, sizes—hand—power. *Write for Free Spraying Guide.*
The E. C. Brown Co. 28 Jay St. Rochester, N. Y.

SPRAY Four Rows of Potatoes at Once
Rows can be any width. Spraying pressure is always strong in the Watson Ospraymo Sprayer. Both wheels are drive wheels. Mixture is thoroughly agitated. No trouble about keeping strainers clean. We make Sprayers for all Purposes—Bucket, Barrel, Power Orchard Rigs, etc. Send for free formulas and spraying directions with catalog. Do it today.
Let us help you

FIELD FORCE PUMP CO. 211 th Street Elmira, N. Y.



There will NEVER be enough number one apples—ALWAYS too many cider apples. Don't waste your time and your trees growing inferior grades. Use "Scalecide" the one sure spray for San Jose scale, and produce number one fruit. "Scalecide" is 100% efficient against scale and has marked fungicidal properties. Used by best orchardists the world over. Endorsed by Experiment Stations. Our SERVICE DEPARTMENT furnishes everything for the orchard. Write today to Dept. N for new booklet—"Pratt's Handbook for Fruit Growers" and "Scalecide the Tree Saver." Both free.
B. G. PRATT COMPANY
50 Church Street New York City

When you write advertisers mention The R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10¼ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

THE LAND BANK of the State of New York may now be organized under law. The bill passed both branches of the Legislature before adjournment last week. The Governor has not signed it yet; but he will. It is one of his personal measures. Now, we must make it useful. The bank will probably be organized by the coöperative saving and loan associations now existing, if no more are promptly organized; but we ought to have two or three local organizations of farmers to go into the organization from the start, and get representation in the board. This is not absolutely necessary, but it is highly desirable. Who will be first? Talk it up in your Grange and clubs and homes. Instructions, literature and forms will be furnished. It will be a distinction to be the first. That privilege may go to your town, if you take it up at once.

*

ON March 17th new postage rates covering the shipment of plants and seeds went into effect. Hereafter the regular parcel post rates, weights, zones, rules and regulations will apply on seeds, bulbs, trees, plants, cuttings, etc., the same as on merchandise. Heretofore, such products have been in a class by themselves. A good many of our readers have been astonished to find that they could send potatoes by parcel post at a low figure provided they were to be used as food. When the potatoes were used for seed purposes, however, a very much higher rate was imposed. Hereafter, such rates will be uniform.

*

NOT long ago we printed an article which discussed a leading question in an unpopular way. The author signed his name and advanced some arguments and facts on what might be called the unpopular side. Now comes another man who writes:

"Why did you ever permit such an article to be printed! What he says may be true, but I know his conclusions are wrong!

Let us ask what is the reason for discussing a farm question? To give a one-sided argument from the popular standpoint alone? We do not think so. A theory or a statement which fears argument and cannot stand upon reason is unsound, and cannot endure. We assume that our readers are intelligent, reasoning people, open to fair argument, and with their conviction strengthened by thinking out the answer to an argument which goes against their own experience. We try to give all sides a fair hearing. For example, we might let a man argue that there is no such thing as a 35-cent dollar, or that farmers ought not to coöperate. That would not prove that we agreed with him, or that his argument could not be answered. We must all learn to take a broad view of life—not trying to stifle opposition, but learning how to answer it through fact and reason.

*

THAT is a noble sentiment by Mr. Monroe Morse on page 527. At 78 he planted a new apple orchard. When told that he would not live to eat of the fruit, he answered:

"I ate apples when a boy from trees that some other man planted years before. I want to plant trees that some other coming boy may eat the fruit."

That is a fine spirit. When a man loves a tree he can do no better thing for himself and for those who are to follow him than to keep on planting and caring for trees as long as he lives. The joy which comes to the true tree lover in watching the little stick which he puts into the ground grow into a shapely and a fruitful tree cannot be measured or counted in terms of money. And what more beautiful legacy can a man leave to posterity than a good orchard? The live stock which he develops with such pride and care may be scattered and handled so carelessly that its identity is lost. The beautiful fields of grass or grain or garden may go back to weeds or forest but the orchard will be respected and cared for. On our own farm six generations unknown to us have lived and worked. Now we can remember them only by the great, beautiful trees which they planted years ago, and which have brought down through the years to us the best that was in their lives.

*

Now comes the Postoffice Department trying to increase the size of the 35-cent dollar. The splendid machinery of parcel post is to be used in doing it. The Postmaster General has selected the following cities for an experiment: Washington, Boston, Atlanta, St. Louis, San Francisco, Baltimore, Detroit, La Crosse, Wis.: Lynn, Mass., and Rock Island, Ill. Rural carriers in the territory supplying these cities are instructed to collect the names of farmers on their routes who are willing to supply farm products by parcel post. Their names are to be printed and distributed among city people—the latter being urged to buy direct from these farmers—shipments being made by parcel post. The system is to be extended all over the country in time. The rapidity of this extension will depend on the business done in these trial places. Here comes the real parcel post—the thing we have wanted for years—the chance for direct dealing with consumers. Like every other experiment with parcel post it will move no faster than the people will push it. It is in the power of the farmer in these selected territories to spread this privilege all over the country. THE R. N.-Y. has fought for parcel post all through the last 20 years. Now its readers who live near these cities have a wonderful chance to be useful. Let them be the first of all to put their names on record and get into this direct trade!

*

WE have reported many cases where strange and outrageous "law" was handed out to farmers or gardeners who attempted to defend their property. Rhode Island has now provided the limit. The reported facts are as follows: Mr. L. C. Bartlett, of Providence, has a yard or garden in which he grows grapes and other fruit. For years he has been annoyed by boys who enter the premises and steal grapes. One day last Fall Mr. Bartlett caught one of these young thieves in the act of stealing. He took the young scamp by the collar and trousers, lifted him over a 34-inch fence and dropped him on the other side. During the struggle this boy scratched his leg. Mr. Bartlett was arrested for assault. The boy sued him for $5,000 damages, and a Rhode Island jury actually gave a verdict against Bartlett for $1,500! This seems to be his penalty for protecting his own property. A more preposterous thing in its line has never come to our notice. Mr. Bartlett should have taken such a boy over his knee and applied a rough pine shingle with a knothole in it in a manner familiar to many of us who were taught to respect property rights in the old-fashioned way. If he had done so he might have been hung for all we know, under the local laws. What is the matter with Rhode Island and her laws, that such an exhibition of donkey justice should be given to the world? We are gathering the facts about this case, and some of them will astonish the country. Suppose we find out right now whether a man owns his own fruit or not!

*

Lest we forget! We were told that the removal of the tariff on food products would surely decrease the cost of living by inducing heavy imports of food from other countries. THE R. N.-Y. has exposed the fallacy of this theory, for prices of food are not regulated by supply and demand, but by arbitrary rules of dealers and carriers. Take beef for example. When the tariff was cut or wiped out we were told that Argentina and Australia would send so much meat here that prices must fall. Secretary of Agriculture Houston now states that imports of beef from all sources amounts to only two per cent. of domestic production. The imports from Argentina are controlled by the beef trust—the same monopoly which has destroyed beef production and slaughtering in the East. There is therefore no hope that South American beef will bring down the price of meat. In both Argentina and Paraguay the number of cattle is declining. In 1832 Charles Darwin found the South American pampas covered with "countless" cattle and horses. There were so many cattle that they were considered common property—killed and eaten about as freely as roadside apples in New England. Horses were so plentiful that no one ever thought of riding a mare. Soldiers in their campaigns against the Indians drove great herds of mares which provided all their food. Now the world's population has increased so rapidly that there is a scarcity of meat. This scarcity will continue in this country until our Eastern farmers can find it profitable to produce beef. Under the conditions which prevailed 25 years ago it would still pay to raise and fatten steers on many a 100-acre farm. Free imports of meat will not help, for the trust will control these imports. The first step should be public slaughter-houses under Federal control—where cattle may be slaughtered and sold.

*

SOME months ago we gave the facts about the celebrated New Jersey cow case, which hung over a line fence between two farms. Briefly stated, a cow belonging to James Van Nest of Somerset County, went through or over the line fence into a corn field owned by Frederick Dealaman. This cow filled herself with green corn, and as is usual in such cases, suffered from bloat, lay down and died. Van Nest sued Dealaman for $50, which represented the value of the cow, on the ground that Dealaman failed to keep his line fence secured against the neighbors' cattle. Strange as it may seem, the court gave a verdict for this $50 to Van Nest. Dealaman was left in the peculiar position of suffering damage to his corn crop, and then being obliged to pay the value of the cow which destroyed the corn. This case was carried up to the Supreme Court, which sustained the verdict, ridiculous as it may seem. Dealaman was not satisfied, and to his credit be is said that he carried the case still further to the Court of Errors. This highest Court in New Jersey has now over-ruled the Supreme Court, set aside the verdict, and Dealaman is not obliged to pay for this cow. Judge Parker in his decision says:

> The provisions of the fence act requiring adjoining owners to make and maintain their respective proportions of partition fences impose no liability on an owner who is in default for accidental injury to animals of the adjoining owner which stray upon his land by reason of the defect in the fence he failed to repair.

Thus Jersey justice asserts itself at last, and the farmers of New Jersey owe a debt of gratitude to Mr. Dealaman for fighting his case through to the end. It certainly would be a most remarkable thing if every Jersey farmer were made liable in this way not only to suffer loss from wandering cattle, but also to pay for them when they killed themselves at the expense of his crop.

*

If any work will make this a better country to live in I think the growth of coöperation among the farmers will bring it about.—Lucius C. Tuckerman.

THAT is the Lord's truth in 25 words. Think for a moment and you will realize it. True coöperation will not only mean material benefits for farmers, but it will mean a broader view of life, a clearer insight into the future and a more unselfish idea of brotherhood and human duty as man to man. We are not speaking of what we call false coöperation, but the true spirit of taking and giving in return. There are so-called "coöperative" schemes now in which a large number of farmers do the work and provide the business. They may receive a small increase over individual work, but the great bulk of the profits go to a few shrewd men who take much but give little. True coöperation is the most hopeful thing in business life to-day, for it involves giving as well as taking.

BREVITIES.

UNDER ordinary conditions the chemicals to use with stable manure are acid phosphate and muriate of potash. We advise three parts of phosphate to one part of muriate.

WE know men who "win their spurs" and then never use them on anything that needs spurring up. The world is full of lazy drones which should feel the educated man's spurs.

FOR the first 24 hours or more of its age the little chick should *sleep*. It will do it no harm to spend the first 48 hours in the incubator—drying off and hardening for the battle of life. Let him *sleep*.

AT the recent New York flower show the gold medal for the best new rose was awarded to Hadley, bright crimson. Two other new American roses exhibited were Killarney Brilliant, pink, and Willowmere, golden yellow.

A SHORTAGE in the cocoanut crop may not trouble you, but it has helped the "producers" in the Philippines. Prices have gone to $25 per thousand. One nut where two grew before means better times for the planters.

PEACH curl. This disease can be controlled by a thorough spraying with lime sulphur or Bordeaux mixture *before* the buds open. If you wait until the buds open the disease germs may be inside, where the spray cannot reach them.

WE have received many letters from poultry men who ask if the X-ray could not be successfully used to determine the sex of very young chicks. It would surely be an advantage if the poultryman were able to guarantee that his baby chicks were pullets. We understand that the use of those powerful rays would sterilize or destroy such little birds. They could probably be used to tell whether a mature hen were laying but would not answer for the babies.

THE FOOD AND MARKET BILL.

The coöperative bill creating a Department of Foods and Markets passed the Legislature just before adjournment last week. The bill was sponsored from the first by Governor Glynn. It was introduced just two weeks before adjournment; and went before the Legislature with a special message in its favor. From the start it proved one of the most popular measures that has been proposed in years. Farmers saw its merits at once, and indorsed it at sight. The city papers gave columns to the Governor's plea for it and editorial approval besides. City consumers saw the possibilities in it for them, and approved. The commission men and food speculators did not see the possibilities of good in it for producers and consumers until the last two days. Then they got very busy, but the work was done. They tried the only available trick of preventing a vote in the Assembly. They delayed, but they could not entirely defeat the bill. The men they relied on to do the work stood loyally behind the bill, and it went through the Assembly just before adjournment 88 to 30.

We gave an outline of this bill two weeks ago. The principles of it have been much discussed in these columns. We have space for only a short reference this week. Briefly the bill provides the machinery of a free and open channel for the sale of farm food products direct from the farm to the city consumer without obstruction of any kind except the necessary licensed and bonded auctioneer through whom the goods must pass. It is the first intelligent and systematic effort to increase the value of the producer's dollar above 35 cents.

Governor Glynn worked hard, intelligently and effectively for this measure. We congratulate him. Senator Wheeler, who introduced it in the Senate, did a valuable service, and credit is due the Senate for putting it through promptly.

And here is something for farmers to remember. This bill was introduced in the Assembly by minority leader A. E. Smith, a Tammany Hall representative from New York. He stood by the bill loyally. It could not have become a law in the situation of the last few days without his services. Let farmers score just one point for Tammany. But Governor Glynn, Mr. Smith and Tammany, all combined, could not have got it through the Republican Assembly this year without the aid of Speaker Sweet. The bill went into the rules committee three days after its introduction. Speaker Sweet had its fate in his hands, and the result testifies to his approval and influence.

Credit is due others that we have no space at this late moment to record. Some of the Progressives deserve a big bunch of praise. One other factor we cannot neglect—farmers themselves, and especially the State Standing Committee on Coöperation fought valiantly for the bill. They responded promptly to every call and they created the sentiment which made the measure possible. Now for a better dollar. J. J. D.

Financing Southern Cotton Planters.

PART I.

If any man doubts the necessity of a system of cooperative farm credits, let him go South and study the economic conditions of the cotton planters. The principles that govern credits in the South are the same old principles we find in all countries and all places at all times when individual producers are dependent on money-lenders for capital to use in productive operations. These principles yet govern in the North and in the West, and in Europe as well as in America. They are emphasized in the South at the present time, because education there is not general, and because the system and the climate has developed there a peculiarly improvident class of producers. The conditions are such that a class of money-lenders operating as a unit furnish capital and credit to a class of producers acting as individuals. The principles governing a condition of this kind are always the same no matter when or where they operate. The men, no matter how few, who control the capital, control the producers, no matter how many. The producer gets enough to sustain life and to keep him in operation. The money-lender gets the surplus of every other man's productions and the accumulation of these individual surpluses makes him rich, while the producers necessarily remain poor. Of course an individual producer of special ability, perseverance and prudence occasionally rises above the conditions that fetter his neighbors, but the exceptions are no more than enough to prove the rule. The lender always exacts the highest possible rate for the use of money, and the borrower when helpless will always concede whatever demand is made. The lender finds his best opportunity for extortion where security is insufficient to guarantee the payment of the loan, yet where economic conditions make the risk practically safe.

English money is loaned to farmers in Ireland to the full appraised value of the farm at 3¼ per cent. interest to be amortized in 67½ years on an annual payment of one-quarter of one per cent. The Irish farmer pays 3½ per cent for 67½ years; and the farm is then free of mortgage. English money is invested in farm land debentures up to 66% of the land values of Denmark, France, Germany and other European countries at from three to four per cent. interest per annum, but English money is loaned in the State of Georgia on farm mortgages at eight per cent. per annum, and loans are made there up to only 40 per cent. of the value of the property. In addition to the interest the Georgia farmer must pay the cost of appraisal, the attorney's fees and disbursement for searching records and guaranteeing title; and the expense of drawing papers and recording titles. The mortgages, payable in bulk, run from one to five years. One English company loans for 10 years in special cases, but in such cases a substantial annual payment on the principal is demanded.

It is, however, in the matter of personal credits that the southern planter finds his greatest embarrassment. The conditions in Augusta, Georgia, are somewhat typical, but the system there is conducted with more moderation than in some other sections of the South. Some of the individual planters own their land; others rent it. In many cases the "Cotton Factor" owns large tracts of land and rents it to the planters. The "Cotton Factor" has an office and a warehouse in the city. He furnishes the capital during the season; and handles the cotton when it is ready for delivery.

March first is the time of making contracts with the factors in Augusta. The "factor's" offices line the streets in the cotton section. During the first week of March the main street in this section is crowded with planters of both white and black, and their wives and children, with their horses, mules and wagons, all waiting their turn to make arrangements with one "factor" or another for the necessary amount of credit to grow the next year's crop. Every planter is treated as a unit. Every contract is an individual contract. Some planters are worthy of more credit than others, and they get it; but the "factor" makes sure as far as human foresight can go. He takes a mortgage on everything in sight, including the mule, the plow, the harness and any other chattel the planter may own. He cannot mortgage the prospective cotton crop, because that is not grown; but he contracts for the purchase of it when ready for delivery, and later on makes payment on the purchase. The planter is rated by the number of plows he operates, but his loan is not made to him in bulk at the time the contract is made. He simply gets an advance from time to time as his needs demand and his condition warrants. In this way the "factor" is in a position to keep an eye on the planter during the growing season, and if necessary suggest or even dictate what the planter is to do. The usual rate for these loans is one per cent. a month or 12 per cent. a year. In Augusta I was told that some loans were made as low as eight per cent.; and that interest was paid only up to the time the cotton was delivered; but it is not an uncommon custom to charge interest at the rate of 12 per cent. for the full year. In cases where the "factor" is not himself financially able to handle the operation with his own money, he assigns his contracts with the planter to the bank, and gets a loan in order to keep up payments to the planters from time to time during the year, and in some cases when this not sufficient, he negotiates credit with the tradesmen, millers and fertilizer concerns, to help out until after the picking season.

J. J. D.

Those New York City Workers.

Farmers have sent us a number of reports about that carload of working men sent from New York to Fonda as an experiment. They seem to have been above the ordinary class of workmen, and were well received as a rule by the farmers who saw them. Some of these men were capable of doing good work from the start, while others knew little about farming, but appeared to be strong and willing. The trouble with most of them was that they expected too much for their services. Many of them demanded $35 a month and their board. It takes an expert hired man to earn that amount of money for farm or ordinary work, and frankly, a great many of these men were not worth that price. Most of them held out for it, however, and thus they were not all employed at Fonda, although they could have obtained jobs had they been willing to work for less money. Some of these men made a mistake in demanding such high figures. They did not have the farm experience to justify them in demanding high-class wages. They could have found work for less money, and with experience might have been worth the price they demanded. These city workmen will make a mistake if they expect too much from farmers in the way of wages. The experiment shows that there are workmen in the city who could be made very useful to our farmers after they learn more about country living and farm work, but these men cannot expect that New York farmers could ever afford to pay $35 a month and board for labor which is not of high class.

New York State News.

GLYNN ON GOOD ROADS.—There is no doubt that Governor Glynn has the knack of summoning facts and figures in convincing array, to his command. He was lately an editor. He writes in concise and convincing terms. About the matter of expenditures for our highway system, he begins his message to the Legislature, March 23, in these words: "New York is engaged in building 12,000 miles of road, which will wear out 40 years before they are paid for. Unless the State makes a radical change in the type of roads it builds it will cost from $20,000,000 to $30,000,000 yearly to maintain and rebuild New York's highways when the present system is completed." He continues by saying that the cost of building macadam roads is $12,000 per mile and that these roads will not last more than 10 years. At the end of these 10 years it will cost at least $6,000 per mile to rebuild them, and the State will have little to show for its expenditure of $250,000,000. "In the 20 years thereafter," he continues, "the tax for highways will be at least $20,000,000 each year, if our roads are to be kept in proper condition." The Governor's proposition is to use vitrified brick instead of macadam. A brick road costs from $20,000 to $25,000 per mile to build but it will last for 25 years, as it has been proven by the hardest kind of traffic over them in the cities, and the annual cost of maintaining them does not exceed $50 per mile. He also recommends that the State go into the business of manufacturing vitrified brick on its own account and thereby greatly reducing the cost of the same. He recommends that prison labor be used and it is his belief that these roads can be built for $15,000 per mile, and on this basis the total cost of a mile of brick road for 20 years would be $16,000 as against $36,000 for macadam roads. "An idea of the importance of the economy I propose," says the Governor, "may be gained from the fact that the total saving in the 7,300 miles of road yet to be constructed would amount to $146,000,000 in the 20 years after their completion, or more than the total cost of constructing our entire system of highways."

COMMISSIONER HUSON REAPPOINTED.—On March 25 Gov. Glynn sent the nomination of Calvin J. Huson to the Senate, to be State Commissioner of Agriculture, and it was immediately confirmed. This reappointment of Commissioner Huson will give general satisfaction to the farmers of the State. The Governor also nominated John F. Farrell, of New York, to be State Superintendent of Weights and Measures, to succeed Fritz Reichmann who resigned. This nomination was referred to the finance committee but will be confirmed later. Geo. W. Driscoll, of Syracuse, was renominated to the position of State Fair Commissioner. His nomination was immediately confirmed. The salary of the Commissioner of Agriculture was increased from $6,000 to $8,000 by a bill passed at the close of the session.

SOME NEW LAWS.—The Governor has signed the following bills: Chap. 60—Authorizing the construction of State and county highways by counties and towns as contractors, with convict labor, and providing for the purchase of machinery and tools. Chap. 61—Authorizing the supervision of any county to provide for the improvement of the highways in one or more towns at joint expense of county and town, and to prepare a definite system of county roads, and to employ convict labor. Chap. 64—Prohibiting the use of gasoline traction engines on public highways unless a person is sent ahead to give warning. Chap. 66—Providing that if farm or lot is divided by a line of tax districts and it consists of two or more parcels, with separate dwelling houses or other principal buildings, a portion of such farm lying in each district shall be separately assessed therein. As there have been 1,300 bills introduced in the Senate and about 1,500 in the Assembly, it is fair to presume that a very small minority of them will become laws.

NEW FORESTRY BUILDING.—The construction of the new building for the College of Forestry at Syracuse University will be begun in April. It is intended to be the most complete and best equipped building of its kind in the United States. The lowest bids for its construction call for an expenditure of $224,000 while the Legislature's appropriation was $250,000. The amount available for actual building operations is $240,000 the difference of $10,000 goes into the fund for administration expenses, etc.

BOYS TO THE FARMS.—New York City has purchased a tract of about 600 acres of land at Denton, N. Y., near Middletown, for its new reform work. The plan is to erect necessary buildings and conduct modern farming under the direction of experts. Much attention will be given to poultry and gardening for the New York markets. The first company of boys from the reformatory on Hart's Island, New York, arrived at the farm some days ago and it is expected that within a few weeks there will be 300 boys there.

COW TEST ASSOCIATIONS.—A campaign for arousing the interest of farmers of Jefferson County to the need of weeding out their unprofitable cows, has been begun by County Agent Robertson, of the Farm Bureau. He proposes to educate the farmers to the necessity of doing this by holding a series of meetings at eight different places in the county, and it is worthy of mention that all these meetings but one are held in Grange halls showing that the Farm Bureau has the cooperation of the Granges in this matter.

RURAL DEATH RATE COMPARISONS.—Some of the county Granges of the State have taken issue with the statement, which caused considerable comment at the State Grange meeting, and which appeared in the report of the tuberculosis committee to the State Grange, that the rural death rate is larger than the city death rate. It has been held that towns of several thousand population should not be classed as in rural districts and, further, that deaths of inmates in State hospitals located in the country should not be classified with the deaths of rural communities. In order to get an authoritative statement on this phase of the subject we interrogated Dr. Herman M. Biggs, State Commissioner of Health, who in a personal letter said, among other things: "Instead of decreasing the death rate in the rural districts you would find that if the deaths of non-residents occurring in the cities, where so many persons are taken for hospital treatment, were charged to the district in which they have legal residence the death rate in the rural districts would be increased. I realize the fact of course that deaths occurring in institutions located in the rural districts would materially increase the death rate of such places, but if we eliminated from consideration all deaths of persons occurring in State institutions the rural rate would exceed that of the cities by at least one point."

According to the January Bulletin, issued by the department, cities and villages of over 6,000 population are included in the urban territory, or in other words, all towns and villages up to 6,000 population are classified in the rural districts. The commissioner has had the statistics classified, confining to the rural districts all towns and villages under 2,500 population, and finds that the death rate for such rural districts is 15.3. The death rate of Greater New York is 13.7. It is a most striking contrast. Dr. Biggs says: "By excluding all places above 2,500 and including such statistics with those of our cities, the rural death rate is decreased only one-tenth of a point and exceeds that of the rest of the State by nearly one point." Of course, it is understood that under the present method of classification of mortality records all deaths are credited to the locality in which they occur.

Woman and the Home

From Day to Day

MOTHER OF FIVE.

She mothered five!
Night after night she watched a little bed.
Night after night she cooled a fevered head,
Day after day she guarded little feet.
Taught little minds the dangers of the street;
Taught little lips to utter simple prayers,
Whispered of strength that some day would be theirs
And trained them all to use it as they should.
She gave her babies to the nation's good.

She mothered five!
She gave her beauty; from her cheeks let fade
The rose's blushes; to her mother trade.
She saw the wrinkles furrowing her brow,
Yet smiling said, "My boy grows stronger now."
When pleasures called she turned away and said:
"I dare not leave my babies to be fed
By strangers' hands; besides they are so small
I must be near to answer when they call."

She mothered five!
Night after night they sat about her knee
And heard her tell of what some day would be.
From her they learned that in the world outside
Are cruelty and vice and selfishness and pride;
From her they learned the wrongs they ought to shun,
What things to love, what work must still be done.
She led them through the labyrinth of youth
And brought five men and women up to Truth.

She mothered five!
Her name may be unknown save to the few.
Of her the outside world but little knew.
But somewhere five are treading Virtue's ways,
Serving the world and brightening its days.
Somewhere are five, who, tempted, stand upright
Clinging to honor, keeping her memory bright.
Somewhere this mother toils and is alive
No more as one, but in the breasts of five,

Edgar A. Guest, in Detroit Free Press.

*

IN reading the excellent bulletin on "Bread" issued by the Ohio Agricultural College last December, we note that the utensils given as necessary for bread-making do not include a bread-mixer, and the recipes call for the old-fashioned hand kneading. We do not agree with this; the bread-mixer is, we think, an absolute necessity whenever bread is made at home, and if the directions given with it are accurately followed the bread is always good. And what a relief it is to hard-working arms! We also find it excellent for mixing stiff fruit cake.

*

HERE is a Californian recipe for grapefruit pie which, while not very useful in the North, may be appreciated by Florida readers: First bake a shell as for lemon pie; then make a filling as follows: Mix one tablespoonful of cornstarch in a little cold water, and over this pour one cupful of boiling water. To this add the juice of two grapefruit, the grated rind and juice of one orange, the beaten yolks of two eggs and the white of one and a small piece of butter. Put all in the double boiler and cook until thick, stirring all the time. When done, put in the shell. Then beat up the white of second egg with one-half cupful of sugar, until thick, and spread with a knife over the pie. Put in the oven and let brown lightly. Serve cold. This makes an excellent pie.

*

IN planning to improve home surroundings, do not forget that every rural family is entitled to some comfortable shady place that may form an outdoor sitting-room in Summer. We naturally expect to find such shade on every place, but trees are not always so arranged as to provide it, and in such cases quick-growing vines will be a help. Furthermore, this shady resting place should be provided with appropriate outdoor furniture; a table firm enough to stand without tipping and large enough to hold books or the dishes for an open-air meal; chairs or settles that will afford comfortable seats, and a little sewing stand that will not upset and scatter thread and thimbles broadcast. None of these requirements calls for a heavy expenditure, and yet they add greatly to the comfort of country living at a season when there is much hard work and little leisure.

*

THE State Superintendent of Schools of West Virginia has issued a bulletin on "Community Studies for Rural High Schools," prepared by the State Supervisor. This bulletin may be called an examination paper on local resources, as it asks the pupils for a complete account of the people, places and resources of their own immediate environment. The State Superintendent says:

The high schools are turning out many boys and girls who know something of Latin and German, something of the civilization of Greece and Rome, and something of geometry, but who know little or nothing about the community in which they live; they know nothing of its history, nothing of its traditions, nothing of its industries, nothing of its institutions, and nothing of its possibilities for the future. The life that goes on about them, with its needs, its failures, and its suggestions, makes no appeal to them, because they do not understand its significance. Our rural communities in West Virginia have greatly suffered in the past because the majority of their young people who have gone to high school and to college, have not returned to them to give them the benefit of their training and their increased ability. They have gone into the towns and cities of the State and into the towns and cities of other States, to seek opportunities there and to use the ability that they have developed. Many of them have gone to seek opportunities in distant places because the lessons they learned in school dealt largely with distant places and distant activities. They have yielded to the lure of things they have read about, and thought about. They have discovered no opportunities at home because they have not been taught how to look for them. Partly because of this desertion by many of their best young people, some of our rural communities are yet undeveloped, and many of those that have been developed owe their development to those who have come in from the outside.

We think these words are true of many localities besides West Virginia. If the school and the home inculcate local pride by pointing out the advantages of a locality, and at the same time direct thought toward improvement of disadvantages, they are likely to induce a solidarity of interest that will produce a high type of citizenship, and that is something we need more than some of the ornamental accomplishments now urged in modern education.

The Unknown Teacher.

In the "good old days" the school teacher in the little red schoolhouse was an important personage in the community, and each family of any social standing at all entertained the schoolmaster or ma'am at least once each term. Housekeepers in those days spoke of "having the teacher" much as they spoke of attending to every other duty in life, and if sickness or disaster put this important event off the calendar the mistress of the farmhouse declared herself "mortified to death," an expression much used in those times. But now it is a common thing to discover parents, good, intelligent folks, too, who cannot even name the man or woman who instructs the boys and girls day by day. Last Fall I met an intelligent, progressive farmer who had to appeal to his children to tell him who was their teacher during the fourth month of the term. "I never pay any attention to the school," he said apologetically.

It is hard on the children when the parents take this attitude toward the school, but it is also hard on the teacher. Many a lonely young person goes from house to house seeking board in the Fall only to be turned away. In many cases is is really impossible for the mistress of the farmhouse to add to her burdens, but in other instances women do not want to bother with a teacher.

Often a young girl or a young man capable of doing good work becomes disheartened because of the loneliness, and gets through the school in haphazard fashion. There is no incentive to do the best work, because no one ever commends, and the year is hurried past as quickly and easily as possible. Of course every young worker should do the best without thinking of outside conditions, but when a human being is practically alone in a commmnity it is hard to do the best. No one doubts that the farm housekeepers have their hands full, and that entertaining in the good old fashion is probably gone forever, but it doesn't take long to make friends with the unknown teacher and give her a hearty word of praise early in the term. Perhaps inviting her for a meal is out of the question, but the busiest woman can smile and say a good word to and for a lonely fellow mortal. If you want to make the school efficient "brag up" the teacher. Set so high a standard for her that she will have to try to live up to it. Make yourself a member of the publicity bureau to speak of the good work done in the schoolroom, and teacher and pupils will feel the encouragement.

HILDA RICHMOND.

Boys in House Cleaning.

From time immemorial the Spring housecleaning has been an all-absorbing subject, and one that cannot be set aside. It is only to be compared with the grand upheaval of nature which has to be endured annually when Jack Frost loses his hold, and the whole surface of the world is made over by floods and mud, sun and rain, until order is brought out of chaos, and the earth is finally solid under our feet again, made clean and fresh and sweet by the mighty forces brought to bear, and perfumed by the breath of violets.

While nature furnishes the forces and decides the manner in which outdoors shall be cleaned, man, or rather woman, must decide the question for indoors. House-cleaning is a fact; the question is, how and when is the best time to begin? To guide the housewife, various methods have been tried and written up, but many are still in doubt as to which is the best. Some say, clean one room at a time, while others advocate cleaning all the house at once and making a time of it; doubtless drawing inspiration from the fact that a week of deep mud is preferable to a more protracted season of less depth. In deciding this question considerable depends on the force the housewife has to work with. Some must do the greater part by themselves, with a little help from the men folks, while others hire a woman by the day, and often are obliged to call on the men then, which plainly proves that while women may seem to be crowding into the field of men's work, she is leaving an open field behind her which no one can fill so well as a man or a boy. The boy as a house-cleaner is superior to a man or two women and can make good wages at it. A boy will laugh at the idea of its being hard work to take up tacks, and shoulder the carpet as easily as a bag of meal, while as for moving the furniture out of doors, that is fun.

He may possibly need a little encouragement while dusting the carpet in order to dust it thoroughly, but he isn't all tired out when it is done; and while you are cleaning the windows he will have ample time to dust the furniture, pictures, etc., which he does not consider work, though it is a great help to have it all ready to set back into the room as soon as the carpet is down. Many boys can clean paint as well as a woman and as quickly. When all is ready he brings in the carpet and helps tack, or stretches it so that it is quite easy for you to tack. After that is done he is not too tired to begin another room, and if you feel equal to ordering and helping a little, will often do two rooms in a day, and be fresh enough for a game of ball afterward, and start fresh again the next morning.

Nearly every woman is familiar with the type of women who make a business of going out housecleaning, and who usually appear in the morning with a worn-out expression on their faces and tell how tired they are to begin with, and keep it up all through the day, until towards night they are so much more tired than you are, that you give them their money and send them home while you finish up yourself. You do not blame them, knowing that the work is too hard to be continued day after day by women; it is only fit for men or boys who are well and strong; and boys as professional housecleaners will find a wide field open for them to work in wherever they may be.

ALICE E. PINNEY.

Mrs. Skeptic—"Oh, go 'long, Anty Drudge! Telling me I don't need to boil nor hardrub my clothes. Everybody I know *always* has washed clothes this way."

Anty Drudge—"No, they haven't. Some heathen places they beat them with stones to get them clean. Why don't you do that if you *like* the hardest way? But if you want the *easy* way, just use Fels-Naptha Soap."

What does washday mean to you? Standing all day, drudging over the washboard, rubbing the dirt out of your clothes, and boiling them to pieces; filling your house with steam and smell, and making yourself tired out? Or

Thirty minutes for the clothes to soak in cool or lukewarm water with Fels-Naptha Soap; a light rub with the hands, rinsing and hanging on the line in half the time, with less than half the trouble than ever before?

Fels-Naptha works for you in cool or lukewarm water.

Buy it by the carton or box. Full directions are on the Red and Green Wrapper.

Fels & Co., Philadelphia.

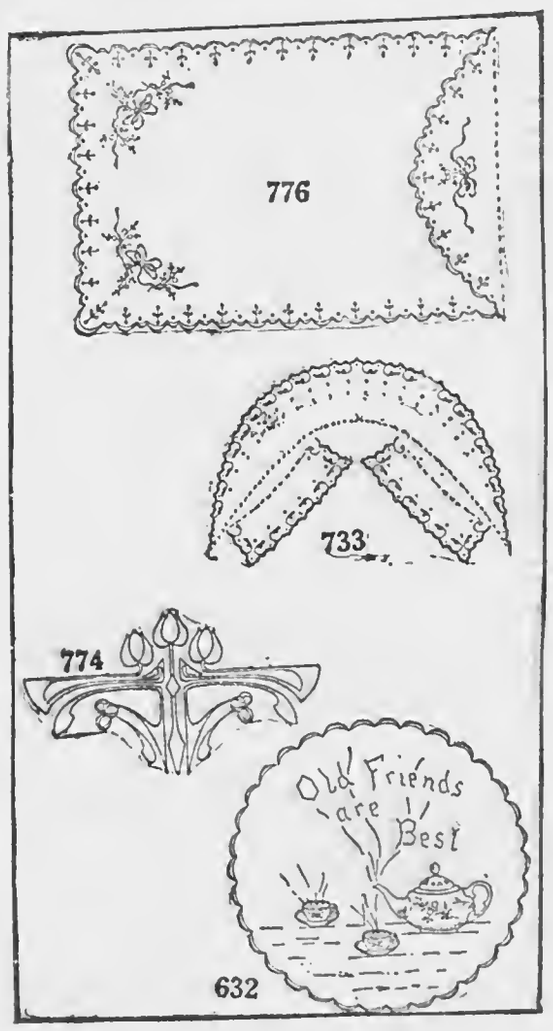
The Rural Patterns.

When ordering patterns always give number of pattern and measurement desired.

8185 Middy blouse for misses and small women, 16 to 18 years. 8195 Fancy blouse, 34 to 40 bust. 8200 Semi-princesse gown, 34 to 40 bust. 8174 Seven gored skirt, 26 to 36 waist. 8194 One-piece skirt, 22 to 30 waist. Price of each pattern 10 cents.

The following patterns at prices quoted include materials for working. Transfer patterns only will he furnished for 10 cents each.

No. 776. A design for embroidering an infant's carriage cover. Stamped on 21x36 best round thread Scotch linen, with one dozen 12 yard skeins of white mercerized floss to work, 60 cents.



No. 733. A design for embroidering a shawl collar and cuffs. The scalloped edges are to he buttonholed. The dots can he worked solidly or as eyelets. Stamped on best white pure Irish linen with mercerized floss to work, 60 cents.

No. 774. A design for embroidering the ends of a table or dresser scarf. Two ends twelve inches wide are given. Stamped and tinted on art crash, 17x54 inches, with mercerized floss to work, 40 cents.

No. 632. A design for embroidering a doyley ten and one-half inches in diameter. One transfer is given. Stamped and tinted on white Irish linen with mercerized floss to work, 25 cents.

Chocolate Buds.

Can any of the home candy-makers give me a recipe for the popular confections called chocolate buds? A. E. F.

Glimpses of Life in Colorado

"Are you going to the sale?" a neighbor asked me. "Everyhody goes, women as much as the men; they don't go to buy, hut to see the folks and then you get a lunch too." It was very strange to one not accustomed to it to see scores of women following around the men and auctioneer from farm stock to machinery and all the odds and ends of a sale; women with babies and little tots clinging to their skirts. For me it would be a very hard day's work, and I cannot become Westernized enough to think it is just the place for a woman. On the plains, however, it seems a woman can go wherever a man can. In many cases if the children are clothed and fed, that ends it, although they are sent to school usually, for it is the law. The little courtesies of life are not taught, and in too many cases, they are not even known by the parents themselves. It is a rare occurrence to see a man lift his hat when meeting a lady, and when it is done it is noted. The young men are greatly lacking in common politeness, those whom I have met, both here and in Wyoming. But there are portions of the East where it is no better. I was much surprised and also pleased when a young man backed out of the door when leaving, cap under his arm, until he was out of the door-way. He attended a short course at Fort Collins Agricultural College last year, and perhaps learned something of manners there, but his parents, particularly the mother, are a little above the average here intellectually, and I think she has had a hand in the training. The boy is a great reader and comes here for reading matter. We have numerous magazines sent us hy friends in the East as well as what we take, and are glad to pass them over. "I like a good short story that tells how rich people live. I am poor, but I love to read of elegance and riches," he told me. They are well-to-do farmers, live comfortably, and left a nice Iowa farm to come here for the mother's health, which has improved so wonderfully that money could not hire them to return.

A neighbor called yesterday and in course of the conversation remarked that she was doing her Summer sewing now, making two gingham house-dresses and lot of pillow slips of calico and gingham, as they were so easy to wash and did not show dirt like white. "I have a lot of good white cotton sheets and pillow slips for spare beds, but I use cotton blankets, gray or brown, Summer and Winter. They save a lot of hard work, and what's the use of killing one's self for the sake of color? I never had colored pillow slips, but I find lots of people do have them for common, and I am going to have them after this."

This woman is abundantly able to have what she needs and wishes, and is strong in hody, hut works hard, doing many things out of doors that really are men's work. There are kinds of white muslins that wash as easy as calico, but of course will show the soil sooner. If one lives in a dug-out it makes some difference, or a sod house not plastered, and has a family of small children. Circumstances alter cases oftentimes. Washing is hard work at the hest, hut doubly so where the water is poor. Some wells of water are so hard that lye has to be used in such quantities that a scum will rise instead of suds. Strange as it may seem the water sometimes is harder than another time from the same well. Only a mile from us a neighhor has a well where the water is very poor, "gyp" they call it, and soapstone, while just half a mile away the water is good. Ours is good, but rather hard. If there is one thing more than another that a woman needs handy and easy to get it is water, hut people who rent or are poor have to take it as they find it, or can get it.

It made my heart sad to hear of a woman who came here less than a year ago from Nebraska, so discouraged it was hard living, with a hushand and large family of children. "We always had plenty of feed for our stock, hogs to kill for our meat, lots of cows to milk and no lack of fuel. Here we have nothing, no hogs, for we raised nothing to feed them, and it's so with everything. We have no money to get hack with. The Lord knows what we will do—I don't." There are hundreds in like position in this western country. The real estate agent is a curse to the country in many ways. There are exceptions, but they are few compared with the many. People seem land mad. Many come here with plenty of money having sold their farms in Iowa and Nebraska for large sums; come here and pay from $10 to $25 an acre, fence, put down well, build fine houses, barns, etc. Do they count the cost after it is all done? It brings the raw land up to a pretty big figure, and then crops are very uncertain. Tame grasses, except in some places Alfalfa, cannot he raised. So the poor homesteader or renter must turn his stock on the range to pick what they can for a living. Very many of the women work out in the fields; plow, cultivate, run the mowing machine and horse rake, load hay, husk corn. I do not think it right when a woman has the house and family of children to care for. One or the other suffers, for it cannot all be done by one pair of hands. Very few women but milk. As a general thing so far as I have learned there are children, large families predominating. I have heard of no men compelling their wives to work in the field, but it seems a naturally drawn conclusion that they will. Scarcity of help is not always the reason. If the older children are girls they are put to the work, following the walking plow in some cases here. There are no schools from May until September in the country. A neighhor woman told me last Fall when we called there, that she helped husk corn in the field five days out of the week and the sixth she washed, ironed, churned, scrubbed, baked, swept and cleaned up for a family of four. Sunday they eitl r have company or go visiting. She is a healthy woman now, but she may not always be so strong. Nature cannot always stand being forced. That is the way some of the people live on the great plains of eastern Colorado. The work and talk is now setting hens and incuhators, getting the garden ready for planting, and looking over the catalogues. I have not heard one say aught against getting garden and flower seeds from the Government. They look forward for them, people of means too.

MRS. FREDERICK C. JOHNSON.

Oatmeal Crisps.

One tablespoon of butter; one cup of sugar; three cups of rolled oats; two teaspoons of haking powder mixed well with the oats; two eggs well heaten; one-half teaspoon of salt; vanilla flavoring mixed with the eggs. Cream butter and sugar, adding well-beaten egg and then the oats, mix very thoroughly. Drop from a teaspoon on waxed paper, leaving a large space hetween for spreading. When these cakes are baked on a buttered pan without the paper it is very difficult to get them off without hreaking. Bake a nice brown. M. A. R.

Hot Beverages Wanted.

I wish to ask what the readers of this department substitute for tea, when they want a tasty hot drink, yet feel that tea is not heneficial, especially at night. No doubt most of us ought to drink more liquid than is usually taken. There are good coffee suhstitutes. What about tea? Cocoa may be too rich, cambric tea and clear hot water too insipid. Will some one who has solved the problem satisfactorily tell the rest of us how you do it? G. L.

HOLLAND CHEESE LOAF.—Pare and shave potatoes in thin over-lapping slices to line a huttered pan. Then arrange in alternate layers of potatoes, grated cheese, salt, pepper and sliced onion. Fill the mold up with sweet milk covering the top with a layer of grated cheese and fine hread crumbs and bake from one to two hours. This is an excellent supper dish. G. M. W.

REMOVING PLASTER DUST.—Our plastered ceiling fell, and although I could sweep the carpet a new piece of oilcloth seemed to he ruined. After repeated washing it continued to look covered with dust. A friend told me to put a tablespoonful of kerosene oil in a basin of cold water and wipe it, which I did, and it looked almost as good as new.

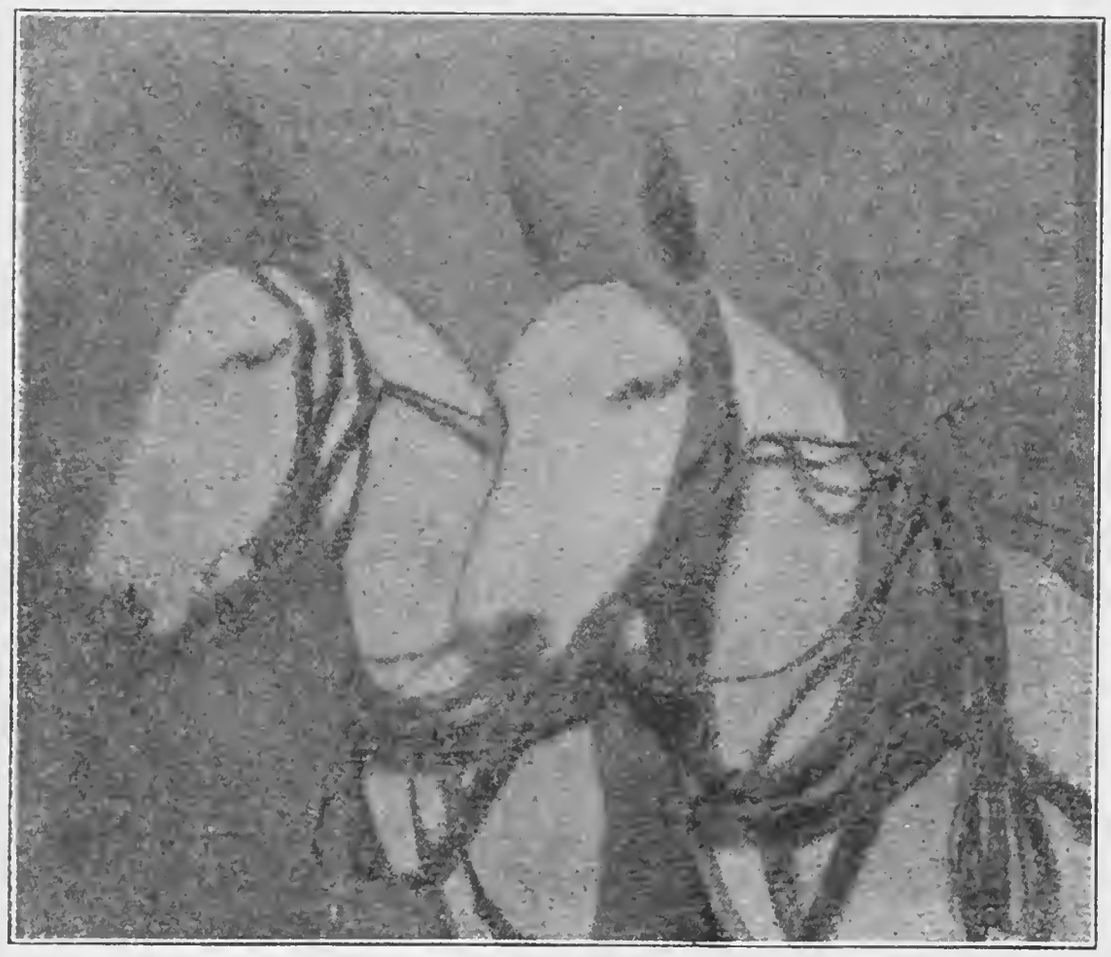
CORN FEEDING FOR MULES.

We know northern farmers who are shocked sometimes when told that in the South and West working mules are fed almost entirely upon hay and corn. It has come to be generally believed that oats in some form make by far the best grain for working or driving animals. When we figure out the chemistry of the balanced ration we run upon the fact that most of the experts declare that corn does not contain enough protein or enough of the bone-forming material to sustain a working animal. How then can it be possible that these mules kept at hard work can thrive without oats? Probably these critics have never seen a mule at work, and are not acquainted with his character or his powers. When it comes to cheap feeding or peculiar feeding a mule is in a class by himself. Yet it certainly makes the northern farmer thoughtful when he hears about this hay and corn feeding. The Missouri Experiment Station conducted an experiment for two years with a view to testing this corn and oat proposition. They selected two pairs of mules that were well matched in type, size, quality and age. The hay which was fed these mules was



A GOOD TEAM OF MISSOURI MULES.

a mixed clover and Timothy with 10 to 25 per cent. of clover. Both corn and oats were shelled. They started out to feed the corn three times a day, and the hay twice, while the mules were kept hard at work. Record was kept of the food they consumed, the work they did and the spirit and endurance which they showed. One pair of mules was fed oats and hay entirely, and the other pair corn and oats. In order to be entirely fair, the experiment was shifted, i. e., for one period one pair of the mules would be fed on oats and hay. Then after a certain length of time in feeding, that same pair would have oats substituted for the corn. This gave a thorough chance to try both ways of feeding with both teams of mules. This experiment went on for two years, and the bulletin mentioned contains a thorough set of figures showing the results.

Briefly stated, when the mules were fed grain and hay, they maintained just as good health as when they received oats and hay, and the corn-fed mules kept their weight slightly better. The mules which were fed corn endured hard work in hot weather better than the others, and no difference could be detected in their spirit. On a fair basis of comparison the mules that were fed the corn did 6% more work than when they were fed oats. The oat-fed mules required 3% more grain, and nearly 1½ per cent. more hay to keep up their live weight than when fed corn and mixed hay. In this experiment the hay was worth $10 a ton, corn 50 cents a bushel, and oats 40 cents. After figuring the values out carefully, it was found that these mules were maintained for 28% less on the ration of corn than when oats were fed. This means that the feed of the mule on corn and hay cost $63.80 per year, while the feed of the mule fed on oats and hay cost $80.79. It would seem from these experiments that the old belief in the great superiority of oats as a feed for working stock has been pretty well exploded. In another experiment with colts it was found that bran and oil meal made an economical substitute for oats, and made a rather better grain. It is quite probable that much the same thing would be true on our eastern farms with a rather slow, heavy type of farm horse. In fact much of the mystery and old prejudice which has surrounded the feeding of oats to farm stock seems to be passing away before the test of actual feeds and figures. We think a mule is better able to take care of hay and corn alone than many horses. At the same time on a great many of our eastern farms, a good sample of flint corn with a small quantity of bran or oil meal added would prove a more economical grain than the oats.

Points for the Hampshire Sheep.

We have had Hampshire ewes give birth to lambs in November and again the following April, but we do not claim greater prolificacy on that account. The present season we have had only about a dozen single lambs dropped among 60 ewes, and have living over 1½ lambs to the ewe, having lost about 12 or 15 by various causes, principal of which was the use of some unsuitable fodder in feeding the ewes, we being very short of Alfalfa this year. So we find the Hampshire a very prolific sheep and the lambs usually weigh from 18 to 25 or 30 pounds to the pair. We often have two or three sets of triplets in a season, and raise them successfully. We believe that the average Hampshire is a little more prolific than any other breed. But chief of the Hampshire's assets is the fact that they drop large lambs, thus giving them a good start. The lambs grow faster and larger than from any other breed, often with good care weighing 90 to 100 pounds at 100 days old. The ewes are good milkers, and give good account of hay and grain fed to them. Here then we have what every man should be looking for, the ewe that will give the largest flow of milk and the largest lambs that grow on the milk. It is the lamb that makes the profit, and the great western ranches know this to be so; to-day there are probably more Hampshire rams being used on range flocks than of any other breed, and the Hampshire lambs are topping the market in Chicago at 80 pounds weight straight from the range. An immense Hampshire flock has just been started in Wyoming to furnish rams for the range, and we all know of Cooper's big stud in Illinois.

Sometimes we wish that it might be a Hampshire that would get the grand champion wether prize at the International from from the Southdowns or Shropshires, but then we console ourselves with the thought that it is the

dollars jingling in our pockets that we really need rather than the glory. Some day we shall have the glory too. The Hampshire is like the Short-horn; it prefers to make good in the everyday walks of life rather than in the showy places.

Now some generalities about sheep. First pick out the sheep that suits you best, remembering that unless you are going to raise Winter lambs you want one that raises the biggest, best lamb right from the time it is dropped. Then give it the best of feed and care. Give the ewe some oil cake, bran and a little corn, with clover hay or Alfalfa. Make a creep for the lambs before they get over two weeks old, and see them grow. Feed them in the creep some bran, oil cake, ground oats and cracked corn, and as they get older, some hay. If the lambs do not come until pasture, do not turn them out too early and then try to have some rape to which you can turn them when about two months old. If necessary to wean the lambs so they may have clean pasture, do so when they are about four months old. Mix one pint turpentine, one pound sulphate of iron and one pound gentian in one bushel fine salt, and keep before them all the time as a preventive of worms and as a tonic. It pays well. Just try making your lambs grow as fast as you can right from the start, and as soon as they get to weigh 60 or 70 pounds or more sell them. You will find that they do not cost nearly as much as where you keep them all Summer and then feed until January or February, and you will be that much ahead.

If you have your lambs come early and one gets chilled, take to the house and immerse to its ears and nose in just as hot water as you can bear your hand; give a teaspoon of stimulant in sweetened water and rub dry. Be careful it does not again get chilled. You will be surprised what apparently hopeless cases you can bring to life. Have plenty of Epsom salts on hand, and if a ewe does not come to her milk at once or has garget, give her one-quarter pound in water. Watch the lamb and see that he passes yellow manure within 24 hours after birth; if not give him an injection of warm soapy water. For scours in the lambs give castor oil in doses of one to two teaspoons. Always make it a point at each feeding time when the ewes are lined up at the hay racks to notice each lamb, to see that none is bloated, scouring or otherwise ailing. Remember that most trouble with sheep comes from improper feeding and lack of exercise. Get "The Domestic Sheep" by Stewart, and if you have any sick sheep try to diagnose from what you may learn in that book. You will usually find the trouble with the feed.

We have spoken rather briefly of various topics in the business of shepherding in this article, but later want to say something about choosing a ram and about keeping to one breed once you have chosen that as your breed. H. B.

The Good Dog.

I was interested in "Live Stock that Pays no Dividend," page 194. If it was not for the roaming dogs we could keep 100 or more sheep with little cost to us. Still we keep a dog. We are now using our fourth; three others, one after the other worn out in the service and gone. We use only thoroughbred Scotch Collie spays; they are always at home and call no dogs around. Instinctively they seem to know how to drive stock. The one lesson they require is to come back at command and not to get to chasing stock. Never strike them; kindness will do everything for them. Our present dog, a year old last March, drove cows all last Summer; would round up 30 head in a few minutes, that would take a man with much running and temper a much longer time. My grand-children used her most of the time last Summer. I have never had a bad-tempered one; this one is everybody's pet, but it does not hurt her for work. W. A. S.
Weatogue, Conn.

LITTLE Lucy had been dutifully entertaining the visitor until mamma came down. "Where were you born?" the good lady asked. "In New York." "What part? Tell me." Lucy thought a minute. Then she answered: "I think that all of me was born in New York."—Credit Lost.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Feed For Freshening Cow.

I have a cow nine years old, due to come in June 7, part Holstein and Guernsey. The last time she freshened she had udder trouble and came near losing one of her teats, so she was not bred last year. What grain would be best to feed her from now on? She will be dry in about a week and in good condition. I can get corn meal, bran, middlings, ground oats, oil meal; how would you mix them? How much to feed? I am feeding mixed hay, Alfalfa and Timothy. Every Summer she has a breaking out on her udder, something like cowpox.

New York. G. E. L.

At present feed the cow three or four pounds daily of a mixture of equal parts ground oats and bran. If this causes her to gain much in flesh, reduce the amount of grain. If the cow is turned to pasture later, omit the grain entirely. If she shows any symptoms of caked udder at calving time, before or after, give an ounce of saltpeter daily and rub the udder twice daily with two parts lard and one part spirits of turpentine. The breaking out on the udder is not at all uncommon, and need cause no alarm.

C. L. M.

Light or Dark Cottonseed.

I was recently told that cottonseed meal was of two colors, dark and light; that the light-colored was the fresh and the only kind fit to feed, the dark, old meal, and that it had, when so colored, lost its food value. What I have been buying has been a dark orange in color. I should like to know whether the above is true. A. R. B.

It is not possible to gauge the age of cottonseed meal by the mere consideration of its color as is suggested by A. R. B. Prof. Cathcart, chemist at the Experiment Station, states that the color of cottonseed meal might depend upon one of three things. First, the seed used, there being a slight difference in the color of different varieties; second, whether or not the seed was steamed before the oil was extracted; and third, whether or not any of the hulls were ground up and used with the meal. Exposure to the air oftentimes changes the color of the meal, and it is rather difficult to get different samples of cottonseed meal of identical color. The differences in my judgment might be accounted for in case the meal becomes rancid or was stored in quarters that were not dry, but rather favorable to the decomposition of the oil that may be present in the meal. The feeding value of cottonseed meal should be based upon its chemical analysis, or in other words its protein content, and not upon the mere matter of color, and it is not true that cottonseed meal that has lost its original or orange color has lost its feeding value. F. C. M.

Cow Ration With Timothy Hay.

What will be a good ration for cows, coming fresh soon, with nothing but Timothy hay for roughage? I have fed equal parts by weight of bran, white middlings, meal, dry distillers' grains. We have never been able to buy malt sprouts here before. How should it be fed, wet or dry, and what grain does it take the place of? Do you consider it any cheaper than other grain at prices given? A. P. S.

You will not be able to get a very satisfactory flow of milk with only Timothy hay as roughage. If you could get some dried beet pulp it would be a great help and when mixed with grain makes a good ration for the production of milk. Malt sprouts may be fed dry in limited quantities, but they are better soaked. They do not really take the place of any other grains satisfactorily, but are used as a sort of "filler" because they appear cheap, but they are really expensive. We would much prefer feeding a ration as follows: Three pounds gluten feed, five pounds distillers' dried grains, one pound oil meal, one pound cornmeal. C. S. G.

Feeding Work Horses.

What is the best and cheapest feed I could get for working horses? I fed, this Winter, with a few ears of corn and mixed hay, but my corn will soon run out. R. G.

The best feed that we have ever used for working horses is Timothy hay with oats and about 10% of wheat bran mixed through them. If you can get oats and bran at a reasonable price you will find that your horses will keep in excellent condition on this ration provided, of course, you feed liberally and work your horses carefully. If, however, you can get other feeds cheaper that will answer the purpose it may be economical to use a imxture of 75% dried brewers' grains and 25% cornmeal which should keep your horses in good working condition. If, for any reason, your horses should not be working for a few days it would be advisable to reduce the quantity of cornmeal in the ration or feed less of the mixture, as it is quite necessary to work horses which are fed heavily on this ration. Do not neglect to give your horses plenty of salt. C. S. G.

Feeding Young Cows.

What do you consider the best feeding ration for Jersey and Guernsey cows for butter production, and quantities to feed? I have been feeding two heifers, giving 20 and 25 pounds milk a day respectively, eight and nine pounds part bran and part gluten by weight, and 20 pounds Alfalfa per day, half of each, morning and night, giving them what corn fodder they clean up at noon. T. F. G.

New Jersey.

If your cows are keeping in good condition I see no reason for a change of feed as they seem to be giving a satisfactory flow of milk. If, however, you find that they are growing thin in flesh as a result of a high protein ration you may find it necessary to add a little cornmeal to the grain ration. C. S. G.

Ration for Young Pigs.

Will you give me a balanced grain ration for growing pigs about four or five months old? Will oil meal be all right in the place of tankage? It is hard to get tankage here. I have no milk for pigs and cannot turn them on pasture. What grain should I feed with stale bread to make a good feed for pigs?

New York. H. E. G.

If you cannot get tankage, oil meal will make a fairly good substitute. A good mixture for four to five months old pigs would be equal parts by weight of bran, middlings and cornmeal with 10% oil meal added. When you feed stale bread made into a slop with warm water in Winter, and cold water in Summer, you only have to add a little cornmeal for fattening purposes during the last six or eight weeks before marketing.

C. S. G.

Feeding for Milk.

I have a purebred prize-winning two-year Jersey which recently calved, and I am now feeding a grain mixture as follows: 100 pounds ground corn and oats, 50 pounds gluten, 50 pounds buckwheat middlings, 50 pounds cottonseed meal, 100 pounds bran; four quarts per day. As her milk yield runs but about two quarts per milking, I fear something is wrong. Have also fed chopped beets, carrots, potatoes and apples a few times; have taken the calf away. Do you think she is likely to do better later on when the cold is over?

Pennsylvania. E. T. C.

It is nothing uncommon for a two-year-old Jersey to give only two quarts of milk at a milking. The grain mixture which you are feeding is all right, but you do not state what roughage you have. If you are feeding plenty of good early cut hay with the roots and apples you are giving her a good chance to show what she can do, and the best way is to keep her a year if she is a valuable cow, and see if she will improve under natural Summer conditions. You can then decide what action to take. C. S. G.

What a DE LAVAL Cream Separator SAVES over any other separator or creaming system

Quantity of cream that no other separator will recover completely, particularly under the harder conditions of every day use.

Quality of cream as evidenced by De Laval butter always scoring highest in every important contest.

Labor in every way over any gravity system, and also over any other separator, by turning easier, being simpler, easier to clean and requiring no adjustment.

Time by hours over any gravity system, and as well over any other separator by reason of greater capacity and the same reasons that save labor.

Cost since while a De Laval cream separator may cost a little more than a poor one to begin with it will last from ten to twenty years, while other separators wear out and require to be replaced in from one to five years.

Profit in more and better cream, with less labor and effort, every time milk is put through the machine, twice a day, or 730 times a year for every year the separator lasts.

Satisfaction, which is no small consideration, and can only come from knowing you have the best separator, with which you are sure you are at all times accomplishing the best possible results.

Easily proven—these are all facts capable of easy demonstration and proof to any user or intending buyer of a cream separator. Every De Laval agent is glad of a chance to prove them by a De Laval machine itself—without the slightest obligation on your part unless entirely satisfied.

If you don't know the nearest De Laval agent, simply address the nearest main office as below.

Top notch butter is mostly up to the cow—and the salt

Is *your* dairy salt as good as your cream?

You will find a big difference in flavor—between merely salting your butter and *Worcester Salting* it.

Expert dairymen are "on" to this. They use nothing but Worcester Salt because its pure, even grains are easy to work in—and quick to bring out the full flavor—

And you know fine flavor and high prices always go together.

WORCESTER SALT

The Salt with the Savor

Worcester Salt is also best for cooking and table use. Its snow white crystals are genuinely salty. Have the wife try it.

Send your dealer's name and address and we will mail you a free copy of booklet, "Buttermaking on the Farm."

Worcester Salt comes in 28 and 56 pound Irish linen bags for dairy use. Smaller bags down to the 5c size for home use.

WORCESTER SALT COMPANY
Largest Producers of High-Grade Salt in the World.

A Small Silo.

I think of building a small silo. I have 20 acres, and would like to keep about three cows, have two now, but find it too expensive to feed them hay and grain, as all have to be bought. Would a small silo be suitable in such a case? If you think so, about what size? I have in mind to erect a small square one inside of barn. What dimensions would suit two or three cows? A. B. C.
Vineland, N. J.

I do not think that A. B. C. could afford to construct a silo to accommodate three cows. In the first place silage does not keep well in a square silo of small dimensions, and the expense of filling the silo, and the risk involved in keeping the silage sweet when such a small amount is fed daily, would in my judgment make it not only impractical but unprofitable. On a basis of unit cost per cow I do not think that it would be profitable to construct a modern silo with any degree of economy unless a dairyman has at least 10 or 12 cows. He might better resort to the growing of mangel wurzels, turnips or some other root crop that would fit in well with his truck farming, or he could resort to beet pulp as a source of succulence. It is not a problem of how small a silo might be built, but rather a question of keeping quality. Small silos, homemade, are often unsatisfactory, and their usefulness would not justify the expense involved. If A. B. C. could grow Alfalfa and supplement this with corn and beet pulp moistened with molasses water, I feel sure that he would be able to feed the three cows more economically.

F. C. MINKLER.

White Particles in Butter.

Can you tell us what sometimes causes white particles in butter from separator cream? Is it perhaps that too much milk goes through with cream and that this milk curdles? F.
Martinsville, N. J.

I think that probably your trouble is due to gathering the butter in the churn before washing. Stop churning when the granules of butter are small, about the size of wheat kernels; draw off the buttermilk, then wash three or four times with plenty of water, giving the churn a few turns each time. Wash until the water comes off clear, and be careful that the water is not much colder than the churning temperature of the cream. I do not think that the thickness of the cream has much to do with the appearance of white particles. An uneven distribution of salt, insufficient working or an over-ripe cream may cause white streaks. C. S. M.

The Milch Goat.

Hardly a day passes without our receiving one or two letters from people who want to buy a milch goat. It is curious what ideas many people have regarding these goats. Some of them appear to think that a goat will give almost as much milk as a cow, that it will live practically without care, and with little feed, and that it can be bought for a few dollars. People write us saying that they have a family of two or three, not enough to warrant them in buying a cow. They have heard that a goat will give milk enough for this family, that it can be kept in a piano box, fed on many of the kitchen wastes with a small amount of hay, and that for $5 or $8 a good goat can be obtained. Just where this vision of utility came from it is hard to say. The goat is an economical creature, but when we expect it to do such a remarkable performance as is herein enacted, the goat falls down and fails to please. The fact is that it is a very good goat that will give two quarts of milk a day and keep that up for three or four months. Of course, we read of goats that give six or seven quarts a day and do other remarkable things. We also hear of hens that pay a profit of $15 a year, and of men who dig 300 bushels of potatoes in a day, chop 10 cords of wood or hoe several acres. There may be such wonderful creatures, but they are not found in the ranks of ordinary hired men, and most of the goats which give this large quantity of milk are now dead. As for prices, a very reliable dealer writes us this: "A goat of any reliable breed that gives from one to two quarts of milk daily is worth $25 or $30, and a breeder can easily obtain that money for her. Such a thing as buying a good milch goat for $5 is entirely out of the question. He may be able to buy a young kid for $5 and raise her into a goat which might give three pints a day, but that is about the limit in the goat line. That young man who thinks he could keep a goat in a piano box and have her turn out milk enough for his entire family on little or no feed should forget his dream at once, for there is absolutely nothing to it."

Packing Butter.

A few weeks ago, I noticed in THE R. N.-Y. an inquiry about packing butter. Years ago I, and before that, my mother, packed butter every Summer, both for ourselves and for customers. It was preferably June butter. The cream was raised in the old-fashioned way in pans (creameries and separators were unheard of). After churning and rinsing the butter, it was salted and left over night. The next day it was worked and packed. We used tubs mostly, though sometimes stone jars. I think we often put a little salt at the bottom. Then the butter was put in, a layer about 1½ inch thick, and packed as solidly as possible with a wooden masher. Then a sprinkle of salt and another layer, and so on till full, the division into layers being for convenience in taking out. When within about an inch of the top, a clean white cloth cut a little larger than the tub was put on and a little strong brine put over that. This gave good satisfaction at that time, but I have never packed any separator butter. S.

Stricture of Teat.

I have a 1,200-pound cow, 10 years old, very fat. She is due to freshen within 10 days. Last August her left hind teat had (at first) a slight sore on the end. I pulled off the scab not knowing the extent of the sore, and I took a scab that covered the end like a thimble. Then I had a serious time and consulted a veterinary, who said it was caused by a sting or a thorn. It healed but partly, closed the orifice so the stream was very small. I fear trouble when she freshens. Can you suggest a treatment? I have a milking tube and know how to use it.
New York. F. E. W.

The stricture at the orifice of the teat should be nicked in one or more places with a teat bistoury and the cut kept from reuniting by frequent stretching with clean milking tube until healed. The nicking may be done with ordinary knife if skillfully handled but there is danger of cutting too deep and it would be best to have it done by a competent veterinarian with proper instruments. No milking tube, or other foreign body, should be inserted into the teat until first washed and dipped into boiling water. Infection is frequently carried into the udder in this way and one quarter lost.
M. B. D.

Care of English Rabbits.

I have a pair of English rabbits, and I would like your advice as to raising and caring for them. How often do they increase? Should I pen the doe separately before farrowing time? How old do the little ones get before the dam weans them? P. S.
Laurel, Del.

The does should be bred four or five times a year. It is a general idea that they will breed much oftener, but there is no gain in over-breeding a doe, as it will only impoverish her and the young will be weak and short-lived. Breeding in this way, each doe should produce from 25 to 30 young a year. The doe should never be kept in the same pen with the buck. The doe should be taken to the buck's hutch from three days to a week after weaning the young. The young should be weaned when they are about six weeks or two months old. Do not breed a young rabbit until it is at least nine months old. H. R. S.

Grain Hay.

Owing to the dry season I got no seeding last year. Could I sow a crop of Canada peas and oats, and cut them in time to raise a crop of millet on the same ground, after cutting the peas and oats green for hay? The ground is corn stubble and in fairly good condition. It had a good coat of stable manure on sod last year. If not, please advise me what to do. D. P. S.
New York.

You can sow oats and peas early and cut them for hay or fodder in time for a millet crop. This is the best combination we know of for an early hay crop.

Why I Started in the Dairy Business

When Dad left the farm to me I asked myself, "How are you going to make the old place pan out?" Dad had run it *his* way. I allowed I'd run it *my* way.

I borrowed money on it, bought more good native cows, became a dairy farmer, and put in a

SHARPLES MILKER

Dad had been paying Del Morgan and Tom Hoops 15 cents an hour for milking about 6 cows each. Cost him 5 cents a cow a day, or thereabouts. No money in that. My three-unit outfit milked 30 cows an hour. Del did most of the work, and I soon found that milking a cow twice a day cost 50 cents a month against $1.50 in the old-hand-milking days. Considerable saving, believe me.

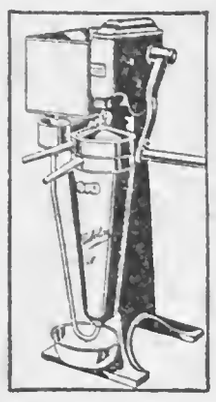
Well, when a machine can milk cows faster and better than I can by hand, make 'em like it, produce a lot of cleaner milk, and cut down overhead expense about two-thirds, I'm ready to take the platform and tell you dairy farmers I'm strong for that machine.

Tom and Del have quit muttering and threatening to revolt. Dragged 'em out of bed pretty early in the old days. Now they sleep longer, start later, finish sooner, earn more than their salt. Got more outfits now, too. Paid the mortgage off long ago. Increased a one-horse wagon milk business to 75 cows and a flock of busy wagons. Traveling some!

The MILKER pulsates like real money and harmonizes with the purr of the

SHARPLES TUBULAR CREAM SEPARATOR

Bought it about the time I got its running mate, the MILKER. Talk about team work! Men, give me a TUBULAR, a bunch of teat cups with the upward squeeze, 75 high grade cows—or even less—and contented help like I've got, and I'm willing to take my chances with the old-fashioned chap who dairy farms with the drudgery methods of his grand-dad.



You can get a *Milker Book* and a *Separator Catalog* by asking for it like I did. Good reading and means bigger profits.

AGENCIES EVERYWHERE

WISCONSIN AND HOLSTEIN CATTLE.

Has the Badger State done more to make the Holstein tribe of dairy cattle famous in many countries than has any other section of this nation? A number of events recently have occurred that seem to show the great dairy State has set the pace in this respect. In the first place the registry office of the Holstein Association is located in this State, in Delavan, and has been for some years. Quite recently it was found necessary to increase office space, and in a new modern building that has been contracted the registry office will have an entire floor, 32 feet wide and 54 feet deep. By this time it requires a force of 20 clerks to handle the advanced registrations that come in from almost every section of the United States. Through this office a deal of the prize money is paid, which with the printing expense amounts to something like $40,000 a year. The postage alone amounts to over $2,000.

In the big milk and cream selling markets it is known that the Holstein tribe oftener is in the mouths of milk dealers and consumers than perhaps any one other tribe. It is known that the Holsteins, either purebred or high-class grades, largely form the herds in Wisconsin whence comes an immense daily supply. Wisconsin gave the white and black animal a tremendous boom when it chronicled the wonderful record of Colantha 4th's Johanna, and then right on the heels of the accomplishment Senator Stephenson, of Wisconsin, sent to the White House under the Taft Administration the Holstein cow Pauline Wayne. That in itself was a traveling advertisement for the big creatures of the dairy world.

It is but a few months since a Wisconsin breeder sent a fine Holstein sire and three heifers to the government of New Zealand, and this served as another distinguishing mark emanating from the great Badger commonwealth.

More local but deeply interesting events have taken place in Wisconsin. On an island that forms a part of Door County a Wisconsin man has planned to found a pure Holstein dairy. F. A. Dennett is the name of this dairyman and he purposes to head his herd with a sire valued at a half thousand dollars. About 10 purebred heifers will be taken to the island shortly and this is expected to form the start of one of the finest dairy herds in the State.

Peter Reiss, of Sheboygan, who is planning an extensive dairy farm near the falls, contemplates making use of 80 head of the white and black tribe.

Holstein breeders of Wisconsin who have shown stock at the International Exposition and at the State fairs give exceedingly interesting stories of the spread of this breed to many sections of the United States, a great deal of it going to new sections, and when one takes into consideration all of the Winconsin influences that have contributed to the use of this great dairy tribe, it is shown that the State stands in the very forefront of the entire movement.

J. L. GRAFF.

FEEDING DAIRY CALVES.

What would be a good ration for calves intended for dairy purposes? I have skim-milk, oil meal, wheat bran, wheat middlings, corn, oats, rye and wheat. For roughage I have corn stover, mixed clover, and Timothy hay. Should the ration be balanced? If so what is the nutritive ratio for such calves? I have endeavored to work out a balanced ration but could find no ratio. I notice that calves like corncob meal better than any other grain feed. Could this be used as the larger part of the grain feed? What is the reason for the calves becoming what is called pot-bellied? What is a cure for scours? A. R.

It will depend somewhat on the breed of cattle as to the food for the first month of the calf's life. If it is a Holstein I would feed it the mother's milk direct from the cow. If it is a Jersey or Guernsey, I would reduce the milk with part warm water to bring it down to something like three per cent milk. It is better to use water instead of skim-milk to reduce the whole milk, because the other solids usually follow the fat closely in rich milk, and therefore, if skim-milk were added, we would have too much protein, which would derange the digestive system just as quickly as too much fat.

After the calf is about a month old, I would begin to substitute skim-milk for the whole milk, a little at first, but in a couple of weeks get her onto all skim-milk. When we begin substituting the skim-milk, we begin to place a little dry grain before the calf. This grain may consist of one part of wheat bran, one of ground oats and one of cornmeal. To this add a tablespoonful of oil meal at each feed. The calf may have all she will eat of this grain ration fed dry, but it is poor practice to place grain in the milk for the calf. It is decidedly better for them to eat it dry, so that the digestive juices of the mouth and stomach may have a chance to act.

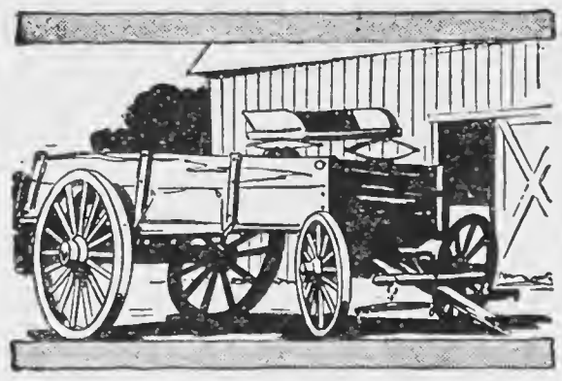
The clover and Timothy hay should be within reach of the calf all the while, but I think corn stover would be of very little value the first six months of the calf's life.

I hardly think that I would feed the calves on corncob meal. There is little good in a corncob but the ash. This can much better be supplied by the wheat bran, and I can see no use in taxing the little stomach with grinding up indigestible material. In fact, that is just what makes the calves "pot-bellied"—filling them too full of stuff that contains so little nourishment that they have to gorge themselves to live. On the other hand, it is not best to raise the calves on a too concentrated feed. The dairy cow ought to be able to get a good share of her food in the form of roughage to make her a profitable animal, and to do this she must of course have a good storage capacity. My rule is to give the calf enough grain to keep her in good flesh and fine thrifty condition, after which give her all the roughage she will eat. J. G. M.

Power for Separator.

Can a 750-pound capacity cream separator be operated successfully by a one-cylinder gasoline engine? My idea is that the motion is not steady enough. F. J. Q.

A separator of 750 pounds capacity or one of any other size can be successfully operated by a one-cylinder gasoline engine. It is better to belt from the engine to an intermediate or line shaft and from that to the separator. A governor pulley is sometimes used on the line shaft, belting from this to the separator pulley. If the governor pulley or some similar device is not used the belt should be shifted from the loose to the tight pulley on the separator gradually. If the separator is not fitted with a loose pulley, it should be brought to speed by hand and the belt put on while running. Separator manufacturers make various attachments for their separators to simplify running with a gasoline engine. It would be advisable to correspond with them. The engine should be set in a separate room and the exhaust piped out of the building. Milk, cream, butter or salt will absorb gasoline odors very readily.



"Weather Wore Me —Not Work!"

That's what many a farmer's wagon would say if it could speak. Water soaks in through the scales of cheap paint, swells the wood, creeps into the joints, rots them. Weather spoils more farm wagons than heavy loads do.

Dutch Boy White Lead

makes wagons, barns, fences, houses, weatherproof. Mixed with Dutch Boy linseed oil it is a basis for any color of paint. It will not crack and scale. It enters wood pores, fills cracks, covers nail heads where damp so often enters, and grips the wood with a protection that defies wet and prevents rot. A few dollars paid for the paint *you know* is right saves many dollars in what it preserves.

You can now get red lead in paste form, same as white lead. Doesn't harden in the can. Fine for painting resinous wood; best by all odds for implements and metal work. Ask your dealer.

A Text Book of House Painting—FREE

Tells you how to mix "Dutch Boy" with any color, for any wood, or any purpose; also how to choose and use colors to look best, to estimate amounts of paint required, and to test paint for purity. Write today for Farmers' Paint Helps No. 256 and be ready for painting time. The Helps include the text book.

CAMBRIDGE STEEL PLOW CO. 700 Foundry St. Cambridge, N. Y.

A HOGHOUSE.

Will you give us plan for hogpen about 16x10 feet, with partitions, feeding troughs, etc., where the fattening animals can be separated from the small pigs? G. A. H.

North East, Pa.

In building such a house the point is to select a plot of ground sloping away from the building. In any case place your building adjacent to a driveway for convenience in feeding the animals and cleaning the house; also for loading and unloading the hogs brought in or shipped out. Building should be 16x12 feet rather than 10 feet in width, to allow for hallway and space occupied by feed trough, this will leave 8x8 feet clear in each pen, small enough for a large hog.

First dig a trench two feet deep and 15 inches wide and fill with concrete for foundation; make the back wall of concrete 16 feet long, eight feet high and eight inches thick. In setting up form cut four 2x4's a little longer than the height of wall, driving 30-penny nails every two feet on one side of 2x4, and say three nails on the narrow side of 2x4; put these inside of form at corners instead of outside. The cement will harden around nail heads and hold in place after form is taken down. These are posts to nail siding on. Embed a line of 2x4's at top in same manner for a plate to which the rafters are nailed. As feeding and cleaning will be done from hallway, front posts need not be over 5½ feet, a door three feet wide enters hallway from the end. Place a window in each end for light; doors entering house from yards can be 2x4 feet or 2x3 feet in cold climate.

Run a sill the length of house and three feet from north wall, this is to support the partition separating hallway from pen. Run a similar sill along to support building, but two inches lower than one supporting partition in hallway, this is to carry the liquids to front of house and keep beds dry. Cement the space between these two sills after house is completed, and lay boards on the four feet of pen opposite gate that opens into hallway. Do this while cement is soft; this is for beds. Next cement the portion of pen between the trough and doors, make this cement flush with the boards under bed and leave slightly concave, which will carry liquids out of door. Troughs should be of cement eight inches deep, two feet wide and three feet long inside measure; this allows a thickness of six inches for ends and fills four feet of space along hallway; trough projects six inches into hallway for convenience in pouring swill in through, and 18 inches in pen where the hogs take it out.

The gate occupies the other four feet along hallway, and should swing away from door at entrance. The boards and 2x4's intended for the roof can be used for frame on cement wall if care is taken in driving nails to leave room to pull them out. I am using asbestos coated paper on roof and it saves the trouble of recoating at regular intervals. If this house is to be used at farrowing time, run a 2x6 around the back of each pen, leaving eight inches clear above floor; attach same to bottom of gate, nothing beneath in front of trough; the pigs run under this when small.

GEORGE E. HOWELL.

Give Us a New Dog Tax.

As to dog tax law and its abuse, would it not be well to have the New York State Legislature pass a bill to compel every individual to pay the tax on every dog owned or harbored by him or her as the case may be? Should not this law be uniform in every town in the State? Islip, Suffolk Co., does not enforce a dog tax. Smithtown, adjoining, does enforce it as far as possible. One man I know who lives in Smithtown where a road divides the two towns, moved his dog house over the road. He is exempt. Why should club men have any more leeway than any other man? Are not men who belong to these clubs just as able to pay a tax as a neighbor? Many sporting men hire their dogs kept in the country; they in most cases pay no tax in the town where they are kept. Many of these men claim to pay their tax in the city. Do they? Their dogs never see the city after they are brought here. Should not these men be compelled to show receipts for their tax? A good dog, one that stays at home, is a valuable piece of property, but a dog that is allowed to run at large is a nuisance of the meanest kind. Not long since I had a dog 12 years old, that thought more of the neighbors' eggs than he did of fresh meat. Result, I had to put him on a trolley and keep him there most of the time. This same dog was the best watchdog at night, I ever saw, but he was a decided nuisance for all that. My experience is that the poorer the family who pay no tax, and some who do, keep the greatest number of dogs, for their neighbors to feed. Give us a uniform law to tax every dog and leave no loophole to evade this tax. F. E. N.

Brentwood, L. I.

HARNESS OIL.—I have kept watch through the columns of THE R. N.-Y. for some time for an article on oiling harnesses. We have always in the past used what was supposed to be pure neat's foot oil with a little lamp black to color. Some claim that this preparation makes the leather too soft, causing it to stretch and break the stitching when it comes to a strain. There are several kinds of prepared harness oils on the market. Have any of our Rural families had any experience with these? I have several sets of harness to oil, so am interested.

Look Beyond the Price!

Lowest priced does not always mean cheapest. Don't you know the real cost depends upon results obtained?

Is a horse cheap that can't work? Is a tree cheap that bears poor fruit? Is seed cheap that produces a small yield?

Some things are "dear at any price." When it comes to feed for your cows, the saving of a few cents on a bag may lose you three times as much in the value of milk produced. **Look beyond the price tag.** You feed your cows to get more milk and lots of it, and if the cheap feed does not produce the milk it's a dear feed.

Larro-feed

is one of the highest-priced dairy feeds made, yet it's the *cheapest* for you, because Larro-feed will more than pay, in increased milk flow, the extra price over any other you can buy or mix yourself.

It will cost you, on an average, 20 cents per bag more than other feeds. That means 2 cents a day per cow if you use 10 lbs. daily. One additional pint of milk per day is all you need to make up that difference.

Cut out the "too high-priced talk." Small feed bills often mean small milk checks. *Profits* are what count—and we guarantee better profits from Larro-feed than from any other feed you can use.

If you believe in spending an extra dollar to get back two, you'll say "Larro-feed" to your dealer today, or write us direct.

The Larrowe Milling Co., 334 Gillespie Building, DETROIT, MICH.

Makers of Larro-feed

The All-White Roof

Fireproof Asbestos Combined With Everlasting Asphalt

Write for FREE Samples

of Breco Asbesto-White Roofing. With the samples we will quote you our low wholesale factory prices—freight prepaid—direct to you.

Breco Asbesto-White Roofing costs you no more than the ordinary roofing. All-white surface, a beautiful effect. Reflects sun's heat instead of absorbing it like black roofs.

Breco Asbesto-White Roofing
Direct to You at Factory Price

ASBESTOS, the world's greatest fireproofer, forms the thick top layer of BRECO ASBESTO-WHITE ROOFING. The asbestos (waterproofed) is firmly united to layers of high grade woolen felt thoroughly impregnated with Gilsonite Asphalt (the famous Breco Rubber Roofing). Better FIRE PROTECTION in a roofing has never been offered. Greater Durability in a roofing is impossible. Finest looking roof you ever saw. Ideal for House, Barn, Garage, Tool House, Poultry House, Silo, Tool Shed, Granary—any and every kind of building. *Especially valuable for all buildings needing extra fire protection.* Two weights—medium and heavy. Shipped direct from factory to you, freight prepaid. Write for samples and prices today. Address

A one-minute change

—and the HINMAN MILKER is at work again

The operator is weighing and recording each cow's milk. No time is lost changing and adjusting the machine. It's so simple—light—and easily handled. The operator is milking from 20 to 25 cows per hour and doing a thorough job. Nothing to watch and worry about—just the simple, silent, steady operation from start to finish—and the work is done.

Moving the HINMAN

An Hour's Recreation To Milk 25 Cows with the Hinman

Watch the Hinman operate and draw your own conclusions. An outfit is near you—investigate. The HINMAN is original. It meets all requirements of any dairyman.

It is the only milker using a drive rod; rapid-pail-changing idea; separate machines; valve chamber—no vacuum in pail. It takes care of itself.

Let the HINMAN help you to get more money out of your dairy. 65,000 cows milked daily. Agents everywhere.

HINMAN MILKING MACHINE CO.

An Experience With Selling Cows.

The article on selling scrub cows to neighbors brings to mind a little experience we had several years ago. We had an inquiry for cows, and my husband selected some from our herd that he would sell, and told the man he could have them at $75 each (this was before we had any purebreds to offer). After looking them over he said he would take two of them, provided he could make his own selection. This being agreed to he selected two of the four offered and said he did not think the others were worth the price asked. Soon after another man came to look at our cows, and he told him he could have the other two at the same price. He bought the two cows rejected by the first buyer, also two calves. We did not call any of them scrubs, but have to sell some occasionally or would get overstocked. It's not often a person sells what he considers his best stock, unless he makes a sale.

The cows were removed to their different homes and of course fed on different feeds. The first man's sons told around that he had been beaten by Mr. S. on the cows he bought; that they did not give near as much milk as he said they would. The other man was more than pleased with the cows and calves he purchased. His cows were given good care and feed, and responded by giving him more milk than they were giving us, and are still in this dairy, giving excellent satisfaction. This man has since been back for more cows, also leaving the request that he be notified at any time when we might have anything in that line to sell. As to the quality of these cows, so far as we knew, we had no choice, for they had done about the same for us, and their breeding was along the same lines.

What made the difference? Was it the individual cow, the care and feeding, or the man behind the cow? We would not believe in selling to our neighbors anything we knew was not all right (or anyone else for that matter), but we believe the care and feeding and the cow wisdom of the man having them to care for has a great deal to do with what they do for us. This is just an illustration of what different men can do, not meaning in any way to criticise any remarks of the man who wrote the article referred too. MRS. R. M. S.

Two Acres of Hog Pasture.

1. On page 197 C. J. D. asked about raising pigs, and F. C. M. tells of a good mixture of seed to sow to have pasture all Summer. I would like to know how many pigs I could pasture on this mixture of seed on two acres, making two yards, one acre in each yard? 2. Can you give me the mixture to put on calves' horns so they will not grow, and is it injurious to them? D. S.

Port Norris, N. J.

1. The mixture referred to by D. S. was oats and peas, rape and clover. An acre of this mixture would accommodate conveniently 1,000 pounds, live weight, of pigs. This would mean five sows weighing 200 pounds each, or 10 100-pound pigs could be pastured on such area. The number that it would accommodate might depend further upon the season conditions, the important point to remember being that the animals should not be permitted to pasture the crop closely, as it will injure not only the oat and pea plants, but the rape plants as well. Our rule is to turn the pigs in when the oats and peas are eleven inches high, and feed in addition to the forage crop a mixture made up of corn and tankage, utilizing 10 pounds of corn to one pound of tankage. With smaller pigs we feed about 1½ pounds of this mixture for each 100 pounds of live weight. In this way they do less tramping in the field, and gain very rapidly.

2. Caustic potash obtainable in sticks at any drug store can be safely used to prevent horns appearing on calves. When the animal is three days old the hair should be clipped from the region where the horn would appear, covering the spot about as big as one-half dollar. The potash stick should then be moistened, and rubbed thoroughly over this area until there is evidence of bleeding from the point just adjacent to the appearing horn point. After this treatment some vaseline should be rubbed around the border to prevent the potash from running down into the eyes. If there is any appearance of the horns after the above procedure, the treatment should be repeated in about 10 days.

F. C. MINKLER.

WOOD AND STONE SILOS.

A complaint from a reader that the silage was not keeping well in his new tile silo led me to make some inquiries of those who had used them as to the value of tile and concrete in silo construction. There is evidently some conflict of opinion in the matter, and it is equally evident that all silos do not keep thier contents properly. Whether this is due to the material of which the silo is made, or whether it is due to faulty methods of construction and improper filling, seems to be a matter open to dispute. So far as I can judge from the evidence presented, however, I am compelled to believe that the material of which a silo is made is of far less consequence than the care with which it is constructed and filled.

Bulletin 70, issued by the Storrs (Conn.) Experiment Station two years ago, spoke disparagingly of the use of concrete or brick in silo building, and quoted a statement of the Illinois Experiment Station to the effect that in a silo constructed of stone, brick and cement the silage rotted at the sides and top to the extent of one-third of the entire amount, and that there was reason to believe that the loss could have been considerably obviated by building the silo of wood. This statement was made in 1888, however, when silo building was in its infancy in this country, and when the principles governing it were less well understood than now. The Storrs Station explains the alleged failure of stone or concrete silos on the ground that these materials being good conductors of heat permit rapid cooling of the silage next to them, and prevent its rising to that temperature which most encourages the necessary fermentation and discourages putrefactive changes. Despite this scientific explanation of why such silos do not keep their contents well, the fact remains that many of them, at least, do; and if some do, it is difficult to see why all of them should not.

A dairyman in Cayuga Co., N. Y., recently told me that he was using the silage from one of two monolithic concrete silos which he built during the past season and that it was keeping well and was perfectly satisfactory. Another dairyman in Schoharie County writes, in answer to inquiry, "Our silo is built of burned tile, 1x1 ft. 6 in. in size, with three holes. The tile are set on end and the holes poured full of concrete, making a nearly solid concrete wall. There is some frozen silage next the wall in severe weather, but I think less than in wooden silos. There is no more spoiled silage than in a wooden one. I expect to coat the inside with coal tar thinned with gasoline when convenient. Were I to build again, I should use something that would give me an air space. I should always build of tile, brick or concrete."

I have been in a great many wood silos, aside from my own, and have yet to see one in which the silage does not freeze next to the walls, in severe weather, or one in which there is not some loss of silage from mold and rotting before it is fed out. Wood stave silos are the popular ones in this vicinity, and are thoroughly satisfactory, being comparatively inexpensive in first cost, and keeping their contents as well as any silo can. Some square, board faced silos being among those first built, are still in use, and in the writer's opinion, this type is "coming back." One on the boyhood home farm was recently visited and the whole corn which had been put into it was found to have made silage of unexceptionable quality. This was State corn, however, with small stalks. From my personal observation and inquiries, I am satisfied that silage will not keep well in any silo which is not kept airtight, and which, when filled, does not have its contents uniformly distributed so that they will pack without leaving air spaces. I am satisfied, further, that wood, brick, concrete and tile all have their merits and demerits, and that the question of which one to use must depend largely upon the amount that one is willing and able to invest and his own idea of economy. M. B. DEAN.

Unseen Forces Behind Your Telephone

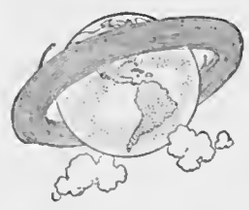
THE telephone instrument is a common sight, but it affords no idea of the magnitude of the mechanical equipment by which it is made effective.

To give you some conception of the great number of persons and the enormous quantity of materials required to maintain an always-efficient service, various comparisons are here presented.

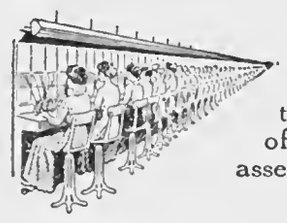
The cost of these materials unassembled is only 45% of the cost of constructing the telephone plant.

Poles
enough to build a stockade around California—12,480,000 of them, worth in the lumber yard about $40,000,000.

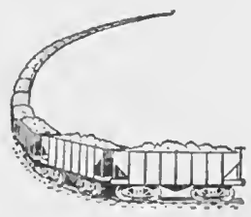
Telephones
enough to string around Lake Erie—8,000,000 of them, 5,000,000 Bell-owned, which, with equipment, cost at the factory $45,000,000.



Wire
to coil around the earth 621 times—15,460,000 miles of it, worth about $100,000,000, including 260,000 tons of copper, worth $88,000,000.



Switchboards
in a line would extend thirty-six miles—55,000 of them, which cost, unassembled, $90,000,000.



Lead and Tin
to load 6,600 coal cars—being 659,960,000 pounds, worth more than $37,000,000.

Buildings
sufficient to house a city of 150,000—more than a thousand buildings, which, unfurnished, and without land, cost $44,000,000.

Conduits
to go five times through the earth from pole to pole—225,778,000 feet, worth in the warehouse $9,000,000.

People
equal in numbers to the entire population of Wyoming—150,000 Bell System employes, not including those of connecting companies.

The poles are set all over this country, and strung with wires and cables; the conduits are buried under the great cities; the telephones are installed in separate homes and offices; the switchboards housed, connected and supplemented with other machinery, and the whole Bell System kept in running order so that each subscriber may talk at any time, anywhere.

ROOFING Per Roll 108 Sq ft 62¢

Almost unbelievable—but true just the same! This unheard of low price for genuine wool-fibre, asphalt-saturated rubber surfaced roofing would be impossible for any other firm to quote—it's only possible with us because we have a capital of ten million dollars which enables us to buy raw materials in larger quantities and at a lower price than any one else. We save both ways—buying and manufacturing—and give our customers the benefit of this big saving. This is the strongest proof we have ever been able to offer in our more than 20 years of business history that we are the **World's Greatest Price Wreckers.**

Sensational Roofing Sale At Amazingly Low Prices

We established that reputation at the outset of our career when, under the name of the Chicago House Wrecking Co., we started out buying up Bankrupt, Receivers' and Sheriffs' Sales. We began smashing prices then and **we've been smashing prices ever since!** Give us the opportunity to do so and we will **prove** to you just as we have proved to thousands of others all over the country that

We Save You ⅓ to ½

on any kind of roofing you buy from us. We can furnish you material for re-roofing your house, barn, sheds, granary, poultry houses, etc., and also furnish the siding, conductor pipe, eaves trough and everything needed—**all** at a **big saving over what you would pay if you bought elsewhere.** It doesn't make a bit of difference what kind of roofing you have in mind to buy—whether Ready Roofing or Galvanized Steel—flat, corrugated, V crimped, standing seam, beaded ceiling or brick siding—we can supply your every need with just the kind you want. Our low freight prepaid prices will amaze you. Send us your name and address and we will prove that our prices are the

Lowest Prices In History of Roofing Business

You can order direct from this advertisement with perfect safety. Our legal binding guarantee, backed by our $10,000,000 capital fully protects you. If for any reason you are not satisfied with your purchase you can return it to us and we will promptly refund every cent and pay freight both ways. Here are some items you may be needing right now. If so, don't hesitate to send in your order. We guarantee complete satisfaction.

CORRUGATED STEEL Roofing, Per Square Ft. 1¼¢

Here is a fine opportunity to save big money on corrugated steel roofing. We are pricing it as low as 1¼c per square foot—a price heretofore unknown. Be sure to write for free samples.

GALVANIZED STEEL Roofing, Per Square Ft. 2¾¢

Highest grade, specially coated, made of specially prepared steel of superior quality. Practically rust-proof and will last a lifetime. Full size sheets. Besides corrugated, it comes in "V" crimped, standing seam and brick siding. Priced as low as 2¾c per square foot—an unheard of price for this grade. Send for free samples.

Big Assortment Samples Valuable Roofing Book Free

Settle this roofing question **right.** The only way you **can** settle it right is to send at once for our big assortment of **free roofing samples**—all kinds—**freight prepaid prices** and a copy of our free Roofing Book. Products, Prices and Trade.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Last year the following premiums over contract prices were paid high scoring dairies: April, May and June, seven cents per 100 pounds; July, eight; August, 10; September and October, 11; November, five.

Miscellaneous wholesale prices at New York are mainly as previously reported, $1.81 and $1.71 per 40-quart can for B. and C., though less of the latter is arriving because of health board restrictions.

Restaurants using two to three cans per day now pay 5½ to 5¾ cents for B. grade.

PRODUCE RECEIPTS AT NEW YORK.

Week ending March 27.

Butter, lbs.	2,878,000
Eggs, doz.	4,830,150
Apples, bushels	90,900
Potatoes, bushels	106,000
Hay, tons	7,634

Corn, bushels	19,250
Oats, bushels	322,775

Wholesale Prices at New York, Week Ending Mar. 27, 1914.

BUTTER.

Receipts are heavy and the market dull, though prices on all grades remain about on the same basis as last week. Good storage stock is getting scare, selling from 19 to 22 cents. There is a little export business in medium qualities at 18 to 19 cents.

Creamery, extra, lb	25	@	26

Factory	15	@	19
Packing Stock	13	@	17

Elgin, Ill., butter market firm at 26⅝ cents. Philadelphia, western creamery, 27 cents.

CHEESE.

Receipts are light and business slow, owing to the high prices asked. The new make is selling quite readily but mainly in small lots at 17 to 17½ cents.

Whole Milk, new, best	17	@	17½
Old, best	19	@	19¼
Common to good	16	@	18

EGGS.

Receipts are very heavy on three recent days totaling 4,800,000 dozen. Some speculative demand has developed at the lower range of prices offered, on what are known as fresh gathered and firsts at 19 to 21 cents. A few nearby fancy white bring 25 cents, but they must be uniformly large and pure white. Here and there a retailer whose trade will stand it pays a cent or two more. Brown and mixed fancy sell mainly at 21 to 22 cents. Trade in white duck eggs is increasing, as buyers find that under modern methods of handling the eggs are free from the strong fishy taste of old-fashioned pond or puddle ducks. Prices on white Indian Runner range from 33 to 38 cents, unless under size.

FRESH FRUITS.

Apple trade has been active on stock free from scald, but considerable damage of this sort is noted. A range of $4 to $5 covers most sales of good barrel apples. Receipts of strawberries from the South are increasing. Some very fine Nic Ohmer sold up to 50 cents, but most business is from 25 to 30 cents.

VEGETABLES.

The potato market is very weak, except on new Bermuda. Large quantities of old are wholesaling at from one to 1¼ cent per pound. In spite of the exceptionally low prices there are increasing shipments from European countries where the quarantine has been lifted. The sweet potatoes offered are running mainly poor in quality and selling low. New cabbage in surplus and low; old selling fairly well at $25 to $27 per ton if sound. The onion market on good whites is firm; medium grades of red and yellow selling slowly. Southern tomatoes in heavy supply and mainly low.

ALPHA Portland Cement is inspected by chemists to make sure that the raw materials are of the proper grade and proportioned exactly right, that the burning is thorough, that the grinding is finer than required by standard specifications, that the finished product is as good as can be made.

ALPHA THE GUARANTEED PORTLAND CEMENT

is then properly aged before shipment, in storage houses that hold 2,000,000 barrels. ALPHA is an exceptional cement—the product of a company whose policy for 23 years has been to manufacture the best, strongest, safest Portland Cement that can be produced. Build with ALPHA and the job will be everlasting.

Ask the ALPHA dealer

Insist on the Guaranteed Portland Cement

When you build of concrete, you build for permanence, and you cannot afford to skimp on the quality of the cement you use. Be careful, advises the U. S. Government, to use a brand *guaranteed* to be up to the government standard for strength.

ALPHA THE GUARANTEED PORTLAND CEMENT

is warranted to more than meet the U. S. Government standard and *every other* standard test. The Government uses it in important forts, lighthouses, dams and breakwaters, where strength and permanence are required.

ALPHA always gives most satisfactory results on the farm. Use it for making walks, silos, barn floors, posts, etc. It goes further and is cheaper in actual use than "just-as-good" substitutes, which may cost a few cents less per sack. Your dealer can supply ALPHA, the Guaranteed Portland Cement. Be sure to order by the full name, because there are fair, good and better grades in Portland Cement, just as in lumber.

25-Cent Farm Concrete Book—FREE

Our book, "Concrete in the Country," 112 pages, fully illustrated, shows more than 100 ways to improve the farm with ALPHA. Regular price 25 cents; free if you send the coupon or write, mentioning this publication, and tell what you plan to build.

The Henyard.

Indian Runners; Hatching Laying Stock.

1. If a flock of Indian Runner ducks lay well in the first part of the Winter, will they lay as well in the hatching season? What would be a good feed for little Indian Runners? In what months is the best time to raise ducks for shipping to the city alive? 2. How early in the Spring may chickens be hatched to be kept for Winter layers. Is the first of March too early? Will they moult the same as old fowls hatched at this date?
Calverton, L. I. E. H. H.

1. Indian Runners that lay through the Fall will not always lay as well in the Spring. Much depends, however, upon the individual and the care. The best feed for ducks just hatched is rolled oats and bread crumbs in equal amounts, moistened enough to be crumbly, with a little fine grit added. Grit is very essential with any kind of feed, and should be continued till the ducks are nearly full grown. After that grit and oyster shells may be put in separate receptacles, and kept by the ducks all the time. When put into the mash two handfuls to the pailful is sufficient. When ducklings are two days old begin to add wheat bran and cornmeal in increasing quantities for a week, when the oats and crumbs may be discontinued. From this age a mixture of bran, cornmeal, meat scraps, and green stuff should be given. A good feed for adult ducks is vegetables, green stuff (in Winter cut clover or Alfalfa) and beef scraps, each one part; low-grade flour and bran, each two parts; cornmeal three parts. A pinch of salt should be put in each mess and a little ground charcoal once a week. The mash should always be crumbly, not sloppy. Ducks will live on less variety. The earlier the ducks are hatched and prepared for the market the better prices they will bring. On the large duck farms the incubators are usually started in January. This means ducklings in February and marketable ducks in April.

2. The Brahmas and Cochins should be hatched in March, the American breeds in April, and Leghorns and other Mediterranean breeds in May if we want eggs when they are the highest. There is such a thing as hatching pullets so early that they will begin to lay in the Summer and be ready to moult when we want eggs. In this case, however, they will eventually get round to change their costumes when the other ladies do and be in style.
W. H. HUSE.

White Diarrhœa.

1. I have about 500 chicks, two weeks old, which I think have the white diarrhœa. The chicks' bowels becomes clogged with a white paste substance forming over the rectum. They take the disease when three or four days old, and new cases develop each day. They stop eating and die in a day or two. I have them in a glass-front brooder-house 12x 20 feet. The house is warmed by hot water pipes running about six inches from the floor, and is divided into four pens. I have been feeding them exactly according to a bulletin published by the Ohio State Agricultural Department. What can I do to stop this disease? To what extent is it contagious? Is it a germ disease? Can I clean the house so that other chicks put in it will not catch the disease? If so, how? I have 800 eggs which I expect to hatch in about two weeks. What can I do to prevent these chicks from taking the disease? 2. In my last hatch of 700 eggs I had about 150 chicks, which died in the shell after they were grown. What could have caused this? Room containing incubators had about two quarts of water evaporated in it each day. Could this have made the air too moist? L. A. R.
Ohio.

1. You are evidently "up against" that scourge of poultrymen, white diarrhœa, probably of the bacillary type. This is a contagious disease caused by a specific germ which is transmitted from one chick to another through the medium of infected food and litter, and which is also passed down from infected hens to their chicks in the eggs. The only remedy is avoidance of hatching eggs from hens that are infected, destruction of all diseased chicks, and thorough disinfection of incubators, brooders and quarters occupied by infected stock. As there is no way of demonstrating the presence of the disease germ in living hens, I should not hatch twice from a flock whose chickens developed bad cases of white diarrhœa. Incubators should be disinfected by cleaning and washing the interior with a five per cent. solution of carbolic acid, or other disinfectant of equal strength; eggs should be dipped into grain alcohol of about 70 per cent. strength before being placed in the incubator, to destroy any germs upon the shell, and brooders should be given special attention in the matter of thorough disinfection. Only vigorous and thorough work will rid your premises of the infection. Burn all litter in infected pens, and use boiling water freely in cleaning floors and walls. Ask the Connecticut Experiment Station, at Storrs, Conn., for Bulletin 74, which discusses this disease, and speaks of the value of early and continuous feeding of sour milk.

2. The cause, or causes, of fully developed chicks dead in the shell are not known. Moisture in the air of the incubator room is necessary, and could not have caused the loss of the chicks.
M. B. D.

Roup and Breeding Stock.

Can you advise me whether a good laying hen that had roup very badly 18 months ago can be taken for breeding, or will the roup be carried through her to the chicks? She is the happiest and best hen in the flock, and I have selected her for breeding. G.
Glen Mead, N. Y.

It is not wise to breed from fowls that have ever suffered from true roup, not because the roup will be transmitted, but because such a fowl has received a severe check to her vigor which is pretty sure to lead to deficient vitality in the offspring. Many cases of simple catarrhal inflammation of the eyes and nasal passages are called roup, however, by those who have never seen the more severe disease, and it is possible that this hen which now seems so healthy did not have roup, after all. In that case, there is no objection to using her in the breeding pen.

Stove-heated Henhouse.

Is there anything objectionable in having artificial heat in a henhouse? I have a house 18 by 160 feet, with 700 pullets in it. I have a stove in the center, but it does not warm and dry it out well in the ends. How would it be to have three small coal stoves, one in the center and one in each end? J. B. W.
New York.

Artificial heating of poultry houses has been tried and found wanting, the results never having justified the cost. If properly ventilated, a henhouse should not be damp, and it will not be if by means of an open front, or other equally efficient means of ventilation, the air is changed with sufficient rapidity to prevent its becoming saturated with moisture and depositing this moisture upon the walls and floors. Ventilation is cheaper than coal, and I would make sure that I had adopted the best system possible for this before I installed more stoves. In most cases the open front style of building provides for the necessary exchange of air without detriment to the health of the hens.
M. B. D.

Skim-milk for Chicks.

Will you give method of using skim-milk for young chicks? Should it always be sour? Can you feed it from the start? Can it be used freely? Is further animal feed essential in the mash? W. I. B.
Massachusetts.

Soured skim-milk is one of the best foods that can be given young chicks, and if at hand, should be fed from the start. Its value lies not only in its nutrition but in its power to inhibit the growth of intestinal bacteria which cause or predispose to white diarrhœa. If given in unlimited quantity, or all that the chicks will readily eat, it will measurably take the place of other animal food, but the addition of beef scrap to the rations is also advisable though it need not be fed in as large quantity as if the skim-milk were not given. M. B. D.

Suspected Tuberculosis.

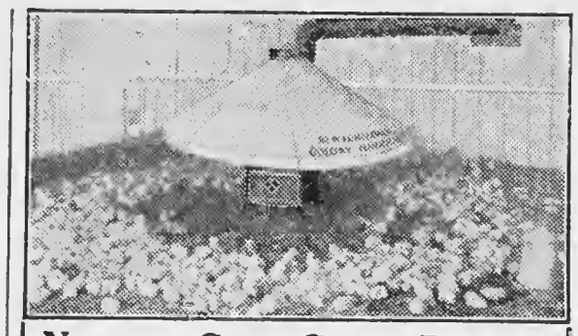
I enclose wing bone of a R. I. Red cockerel. You will observe the unnatural or diseased condition. Will you tell me what it is, and its cause and cure or prevention? This bird was thin, but had a good appetite, looked a trifle pale around comb and wattles, but was active, seemed as healthy as most of the rest of the flock.
New York. M. T. W.

The condition of this bone suggests tuberculosis, which frequently affects fowls, attacking any organ of the body, including the bones. It would be well to examine the other organs, particularly the liver, of any other fowls dying with similar symptoms, and see if the broken-down tubercles or masses of yellowish pus may be found. As to treatment, there is none, other than to remove evidently diseased birds from the flock, and to burn or bury the carcasses of those dying or killed. M. B. D.

Utilizing Old Hens.

How do the large poultry farms which breed Leghorns dispose of their hens when they have outlived their usefulness as layers? If it costs 90 cents to $1 to raise them to the laying point, what do they do with them to realize the first investment, as they must have hundreds to dispose of and a one or two-year-old Leghorn cannot be the best of eating.
Connecticut. G. M. S.

With the exception of those sold for breeders, the number of which would vary with the reputation of the breeder and the efforts he made to dispose of mature stock in this way, I know of no other outlet for surplus stock than the general market for fowls. While a two or three-year-old Leghorn may not be the best of eating, if in good condition, and properly cooked, she is not to be despised by any means. The turkey served the writer at a recent banquet was inferior, in his estimation, to a well-cooked two-year-old Leghorn hen. M. B. D.



NEWTOWN GIANT COLONY BROODER
Coal-burning. Self-regulating
Simple, safe, serviceable. Efficient, economical. Saves time, labor, fuel. Makes success sure. Heartily endorsed by practical poultrymen.
"*After thoroughly testing the Newtown Giant Colony Brooder, we consider it a good stove in every respect and one that will save the poultry fraternity thousands of chicks and a large amount of money.*"—W. R. CURTIS & Co., Ransomville, N. Y.
Made in two sizes for 300 to 1,500 chicks. Write now for catalog. We prepay freight if there is no Newtown dealer near you.

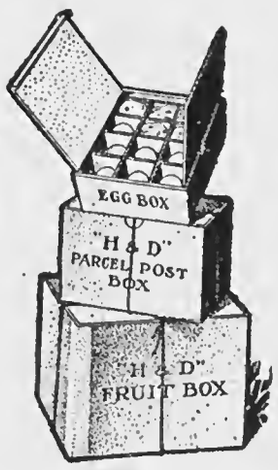
IDEAL COAL STOVE BROODER
Price, $17.00. With Regulator, $22.00
LIBERTY STOVE CO.
110 N. Second St., Philadelphia, Pa.

300 LICE Or More on One Hen
Is by no means uncommon. No one would expect to fatten a steer with that number of "ticks" sucking his blood, but many expect the old hen to go ahead shelling out eggs while lice and mites are sapping her very life. We have counted over 2000 dead lice under a row of ten hens, on a roost board painted the night before with Lee's Lice Killer. This great killer does double duty—contact kills mites, lice, bedbugs, etc. about the roosts; the vapor kills lice on the chickens sitting over it. Put up only in airtight cans.

For sale at over 10,000 towns.
Three sizes—35 cts., 60 cts., $1.00. Poultry Book free.
GEO. H. LEE CO. Omaha, Nebr.



SHIP BY PARCEL POST IN STRONG, LIGHT "H & D" BOXES
"H & D" Boxes are designed to carry farm products by Parcel Post. They meet all requirements of new regulations and *guarantee safe delivery*. Made of double-faced, corrugated Jute board—a perfect cushion for eggs and other fragile articles—protects from heat and cold. Waterproof, sanitary, light, firm and strong. Shipped knocked-down, easy to set up and pack.
"H & D" Three-piece Egg Boxes—Five Sizes
Safest, most convenient for mailing. Double thickness corrugated board on all sides. Sizes, one to six dozen eggs. A one-piece dozen-size box for special trade.
"H & D" Boxes for Dressed Fowls, Fruit, Butter, Etc.
We make up shipping boxes for any kind of farm produce. Write stating size and weight of articles you ship for quotation on boxes.
Send for Free booklet "*How to pack it for parcel post*"
"H & D" Chick Boxes and Fireless Brooders known and used by successful poultrymen everywhere. *Write today for booklet.*

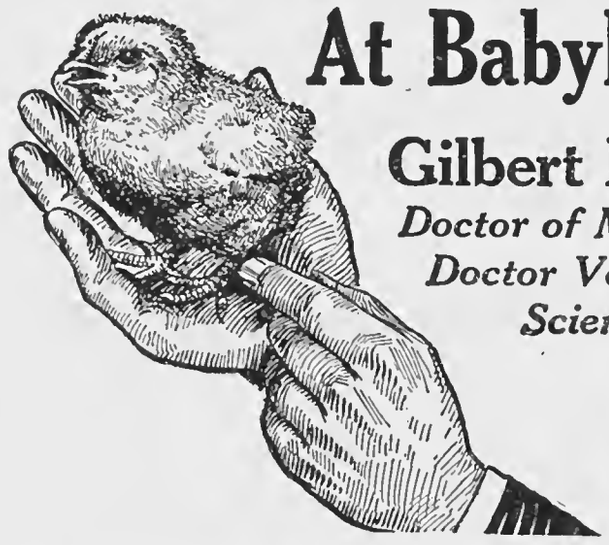
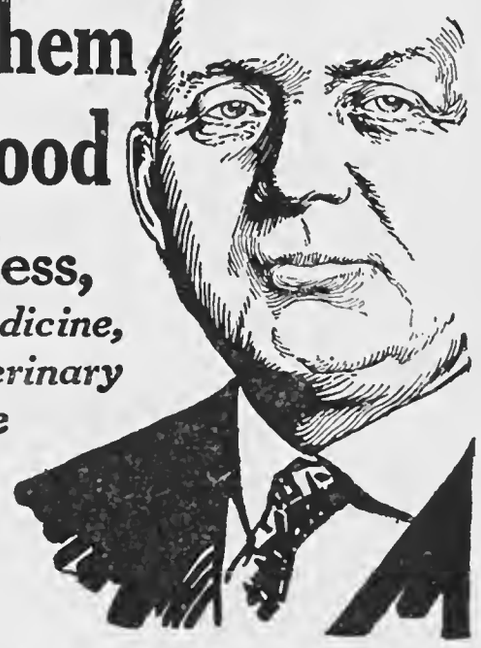
Save *All* your Chicks—Put Stamina into Them At Babyhood




Gilbert Hess,
Doctor of Medicine,
Doctor Veterinary Science
The annual loss of young chicks in the United States is staggering. *More than one-half* the yearly hatch die before reaching pullet age—die through leg weakness, gapes and indigestion. Talk about conservation—think of the millions of dollars that poultry raisers could save by saving most of these chicks.
Yes, most of them can be saved—saved by starting them on
Dr. Hess Poultry PAN-A-CE-A
Right from the very first feed. During my 25 years' experience as a doctor of medicine, a veterinary scientist and a successful poultry raiser, I discovered that, by using a certain nerve tonic and appetizer, *leg weakness could be absolutely overcome;* that the use of another certain chemical that is readily taken up by the blood would cure gapes, by causing the worms in the windpipe (the cause of gapes) to let go their hold and helping the chick throw them off. By combining these same ingredients with bitter tonics and laxatives, I found that I could control and invigorate the chick's digestion.
My Poultry Pan-a-ce-a helps put stamina into the chick, strengthens and cleanses its system and sends it along the road to maturity, hardy and robust. Most of the biggest poultry farms in the United States, where chicks are hatched out by the thousand every day during hatching season, feed my Pan-a-ce-a regularly.
Dr. Hess Poultry Pan-a-ce-a is the result of my successful poultry experience and scientific research in poultry culture—there is no guesswork about it. Ingredients printed on every package. Now listen to this
Get-Your-Money-Back Guarantee
You buy Dr. Hess Poultry Pan-a-ce-a of your dealer. If it does not help your chicks grow, keep them well, make your poultry healthy and your hens lay, he is authorized to refund your money; you can't possibly lose—Pan-a-ce-a must pay or you get your money back. Costs a penny a day to feed 30 fowl. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West. Buy of your dealer—Pan-a-ce-a is never sold by peddlers.
Dr. Hess Stock Tonic
Your stock need this tonic now to harden and condition them after the confined heavy feeding of winter. There's nothing better to put horses in trim for hard spring and summer work. Milch cows need it badly just now to prepare them for the heavy milking season ahead. Dr. Hess Stock Tonic makes all stock healthy—keeps them toned up and expels worms. Sold under money-back guarantee. 25-lb. pail $1.60; 100-lb. sack $5; smaller packages as low as 50c. Except in Canada, the far West and the South. Send 2c. for my *new* free Stock Tonic book.
Dr. Hess Instant Louse Killer
Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks or if kept in the dust bath the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 60c. Except in Canada and the far West. I guarantee it.
DR. HESS & CLARK, Ashland, Ohio

The Henyard.

THE EGG-LAYING CONTEST.

Notwithstanding the heavy gain of over 600 eggs in last week's production, this, the twentieth week, shows a further gain of 264 eggs. The output for the week was 3,437—an average of over four eggs for every hen or pullet in the contest. Pen No. 42, the "sour milk" pen of White Leghorns from Storrs Agricultural Station, takes first place for the week with a score of 56. This is the highest number yet laid by any pen in the contest. The individual record is, 5, 6, 6, 7, 6, 2, 7, 5, 6, 6. This is certainly good laying and this pen has laid well from the start, for their total score is 645. Only two pens exceed this, Francis F. Lincoln's White Leghorns with a record of 659, and Tom Barron's White Wyandottes with a total of 785. Daniel Hine's pen of "Dunghills" take second place with a score of 55, the laying being remarkably even, viz.: 5, 5, 5, 6, 6, 7, 6, 5, 4, 5. But their total to date is only 361—less than half that of Barron's Wyandottes, and it is the totals that count.

Colonial Farms S. C. Reds laid 51, and four pens laid 50 each. They are Tom Barron's White Wyandottes, Frank L. Tuttle's Barred Rocks, the White Leghorns from Tomoka Poultry Farm, Ellington, Conn., and Tom Barron's White Leghorns; 52 pens laid 40 or over during the week. For those who wish to compare the records I give below some of the weekly scores and the totals:

I have a very interesting report from the Missouri contest, which is worth a separate article. GEO. A. COSGROVE.

Fat Laying Hens.

On page 135 B. B. says if he fed R. I. Reds same ration as lighter breeds they would get so fat they would not lay at all. How fat must a hen get to be too fat to lay? January 24 I saw a hen that had been laying for over two months killed, dressed and weighed. This hen was so fat that her hind parts had dragged on the ground in walking, and I never saw so fat a hen in my life; yet there were eggs yet to come. I had always believed they could be too fat to lay, but this shook my belief. Breed, White Wyandotte, dressed seven pounds.
Adrian, Mich. E. L. L.

The hens that are too fat to lay are probably outnumbered, 10 to one, by those that are too thin to lay. Eggs will not be formed unless there is a surplus above the needs of the hen for nutrition, and any such surplus not used in egg production will, of course, be stored as fat. Old hens take on fat readily, and old hens, as a rule, do not lay well; this may be the reason that over fatness has been so often blamed for sterility, but to just what extent it is responsible for it probably no one knows. M. B. D.

Hens Lay After Dark.

Can you tell me why the hens lay eggs after dark? We have got quite a few after dark lately and I would like to know the cause. E. C.
Massachusetts.

For no reason, that I am aware of, except that the egg chances to reach complete development at that time and is extruded. Fright, or some other unusual condition disturbing to the hen, might cause her to retain a fully developed egg within the oviduct and deposit it after dark. It is supposed to require about 16 hours for the full development of an egg within the oviduct but it need not be deposited in the nest except at the will of the hen. M. B. D.

Poultry Dog; Pasture for Hens,

1. Egg farming is my specialty; I am making preparations to go into the business extensively. I have imported some Leghorns and one Wyandotte from England. Some of my neighbors are bothered with chicken thieves. I have no dog; am going to get one. Which is the best breed of dogs for the poultryman, that is to watch and give alarm after night? 2. There are about eight acres of my chicken lot that are bare, and I wish to get it in a permanent sod. What would be the best kind of grass seed to sow, Timothy, Blue grass or Red-top? Should it be sown alone? If sown this season, will it stand much grazing the same year? I am thinking of sowing one-half acre in Alfalfa; would the chickens kill it by letting them run in to feed at will? This is a clay soil, and is underlaid with limestone, and rather rich. Poultry has been running on it for the past five years. J. P. G.
Versailles, O.

1. The Airedales seem very popular with some of our readers as watch dogs, though I surmise that the training of the individual dog has as much to do with his usefulness as the breed. 2. I should sow a mixture of the grass seeds that you mention if I wished a permanent sod, but should sow Alfalfa alone. Neither should be pastured by hens until thoroughly established, and even then, if many fowls are permitted constant access to a small plot of any kind of grass, they will destroy it. By pasturing very lightly the first season, and to only a limited extent thereafter, you may be able to keep a sod in the native grasses or in Alfalfa, but it is a different matter to keep hens that are confined to a run from destroying all green stuff, and unless your runs are large in proportion to the number of hens, you will not be apt to succeed. M. B. D.

House for 200 Hens.

I would like to know the best and cheapest way to build a henhouse that would accommodate about 200 hens. Could I use elm to an advantage? I had in mind to build one 7x5x12 feet and about 50 feet long. Would there be room enough for 200 hens in such a house?
New York. M. J. S.

Two hundred hens should have from 600 to 800 square feet of floor space, and a building 12x50 feet in size would do. It would be more economical, however, to build it deeper, say 16 to 20 feet, and make it long enough to give the desired floor space. The tendency has always been to build poultry houses narrow and long, but it is considered better practice, nowadays, to give them much greater depth, thus saving material by making them more nearly square and providing other advantages also. A building 20x30 feet would be superior to one 12x50, and would require less lumber in its construction. Elm, or any other lumber at hand, may be used, the chief requisite being tight walls on all sides but the front, and that preferably of the modern open style. M. B. D.

MRS. YOUNGBRIDE: "I'd like some fish, please. What are these in the barrel?" Clerk: "Salt mackerel, ma'am." Mrs. Youngbride: "Are they quite fresh?"—Boston Transcript.

Dune Alpin Heavy Laying S. C. White Leghorns

have won more firsts, specials and other awards in the last four years at New York, Boston, Hagerstown and Philadelphia than all our competitors combined.

More Money From Your Hens!

Do You Want to Learn How?

WE are in a position to help you with your poultry. The best poultry writers in the country are ready to answer your questions, and will direct you step by step in the development and care of your flock. Through their help you may become an expert yourself, if you will follow their suggestions and take up a line of reading in connection with your practical work in the henyard. This service is free to all subscribers and their families. Make frequent use of it, and begin at any time.

Damp Henhouse.

I have a shed-roof poultry house 100x 14 feet, seven feet front, five feet back, with curtain front. I keep 500 hens in this house without partitions. The floor is made of matched lumber but the litter is always damp in Winter. The moisture seems to come from below, and the end where the fowls congregate the most gets the wettest, though the floor at this point is two feet above the ground. If I should cover the floor with one-ply tar felt and then lay another matched floor over this would it then be enough drier to warrant the extra expense? The building rests on posts 18 to 24 inches above well-drained ground, and is not enclosed under floor, thus allowing free circulation of air. I feel certain it is not caused by lack of ventilation, as we are very particular about this, never closing curtains day or night unless mercury goes very low. J. E. Y.

Baldwinsville, N. Y.

Excessive moisture in a house built above ground as yours is, is proof positive that the method of ventilation adopted does not cause a sufficiently rapid or complete change of air to remove the moisture from the house before it condenses on floor and walls. Moisture cannot come through a floor set upon posts, with free circulation underneath. In all probability, the openings in the front of your house are of such size or location that they do not permit of sufficiently rapid movement of the air from within out; otherwise the moisture laden air would be driven out before it became so saturated as to condense upon floor and walls. All moisture in such a house comes from the bodies of the fowls, and it is useless to insulate floors or walls; more efficient ventilation is the remedy.

M. B. D.

Ailing Turkeys.

What could I do for the roup? We have only lived here for one year, but the roup has been the great trouble with the place before. Last year I turned out in one brood 45 young turkeys and they lived and grew well until they were wing-feathered, and then the roup set in and our chickens had it too. We lost nearly all of them. H. H.

McDaniel, Md.

It is possible that your turkeys had "blackhead" instead of roup, as they are more subject to the former infection and are, in fact, almost impossible to raise in many sections because of this trouble. There is no cure for it, so far as known, though keeping them on ground not previously roamed over by turkeys and other fowls, and feeding them an abundance of soured skim-milk from the start are preventives.

True roup, the symptoms of which resemble those of a very severe cold in the head, is found more often among hens, and is to be prevented by destroying the carcasses of all fowls dead of the disease and thoroughly cleaning up and disinfecting their feeding utensils and living quarters. The first mentioned should be cleaned with boiling water, or a chemical disinfectant like a 5% solution of carbolic acid, and the quarters should be whitewashed with lime containing four ounces of crude carbolic acid to the gallon. Care must be taken promptly to remove all sick birds from the flock, as the disease spreads from one fowl to another, and their living quarters should be such as to protect them from taking colds, with which the disease is apt to start. M. B. D.

Leg Weakness in Chicks.

I had six Partridge Rocks hatched January 29, 1914; put them outside in a glass house for one week. Thinking it was too cold I put them in a warm cellar, on boards, with fresh sand and litter. After a week, or when they were about two weeks old, two of them got weak in legs and could not walk, and in two more weeks or when they were four weeks old, the remainder were affected the same. I asked an old chicken man, and he said it was leg weakness from being on boards, but he had never seen it happen until they were eight or 10 weeks old. Will you help me out?

New Jersey. G. B. H.

The loss of vitality manifesting itself as "leg weakness" is an almost inevitable result of keeping young chickens indoors and under artificial conditions. It is unusually seen at from two to four weeks of age and I know of no remedy or preventive other than to get the chicks out of doors and upon the ground for at least part of the time. I have never been able to keep chicks indoors for more than three weeks before they began to show signs of failing vitality but have had no trouble after they were placed in outdoor brooders and given access to the ground. Proper feeding with green stuff and meat food, and dirt and sods to scratch in, will help, but I know of no real remedy for this condition other than the outdoor life natural to fowls. M. B. D.

Feeding Laying Ducks.

I wish to know the proper rations and quantity to be fed to 25 Indian Runner ducks, to produce the best results in laying season. My ducks have a good range, and are stuffed with bran, cornmeal and middlings mash, yet are not laying at all now, although they began laying first of December. I wish to know what they lack, or if it is possible to overfeed.

Chambersville, Va. J. C. C.

I would suggest the following. A mash mixed to moist or crumby consistency made as follows: Two parts wheat middlings, two parts ground oats, one part cornmeal, one part meat meal, 10 per cent by weight of grit, 10 per cent by weight oyster shell. Mix with these equal parts by bulk of some finely chopped green food and feed it in long troughs, so that all fowls can get access to it at the same time. Feed this mixture three times a day, giving enough each time so that the birds will clean it up in 15 minutes. A. L. C.

Feeding Green Bone.

Will it be safe and good for little chicks when about three weeks old to give them about three to four times a week some green cut bones? How much should be fed each time to about 100 chicks or would beef scraps be better for them? Please advise about same for laying hens. E. F.

New York.

A good grade of beef scraps is to be preferred to green cut bone for young chicks, though the latter may be sparingly fed after the chicks are two or three weeks old. A "pinch" to each chick, gradually increasing the amount as they become older, may be given two or three times weekly. It is a better food for laying hens, though they may be overfed upon it if judgment is not used. Perhaps a half ounce per hen, twice a week, would usually be about right. Cutting bone is an exceedingly laborious job and where power is not at hand for this purpose few poultrymen will overfeed of it for any great length of time. M. B. D.

Mating Breeding Pens.

How many two-year-old R. I. Reds can I use for breeders with two cockerels, changing once a week in the same coop? One breeder tells me 50. W. J. W.

Connecticut.

Two vigorous cockerels should be sufficient for 50 hens of the larger breeds, though if only one is permitted in the pen at a time, I should change them oftener than once a week. Every day, or every other day, would be better. If these hens have the liberty of a yard, I should consider it as well to keep both cockerels with the flock, but if they are closely confined, better results might be obtained from alternating them.

M. B. D.

WHITE OR BROWN EGGS.—Last season country egg buyers in this locality discriminated between white and brown or mixed eggs. Previously no difference had been made to the producer, so people with small flocks of white-egg hens could not realize the advantage which white eggs hold above other eggs. People with large flocks crate and ship their own eggs. The demand for white eggs has been extreme this year and flocks of white-egg hens are far in excess of other kinds, yet few eggs could be obtained. At one time 50 cents a dozen was paid for white eggs, while 46 cents was given for brown and mixed eggs. An occasional buyer who had special contracts, offered 75 cents a dozen for choice white eggs. Consumers, knowing of these prices, thought poultrymen must be getting rich, but though prices were high, few producers got much money, for they did not have the eggs. One flock of R. I. Reds in our neighborhood gave good returns of brown eggs during all the period of high prices. Prices have dropped now and are running from 28 to 32 cents.

New York. C. M.

MRS. NEWLYGILT: "That's a pretty good-lookin' one. Show me that." The Piano Salesman: "That's one of our finest instruments. I sold one just like it to Mrs. De Frazzle. Solid mahogany, seven and a half octaves." Mrs. Newlygilt: "Seven and a half? Send me one with eight."—Cleveland Plain Dealer.

SENDING EGGS TO CUSTOM HATCHERS.

At this particular season of the year a good many people are planning how many chickens they can possibly get hatched, and how they will do it, with very little thought of how they will raise them. To meet this demand on the part of the American poultry lovers, custom hatcheries have sprung up all over the country. They have certainly filled a long-felt want. It is a calling that is full of tribulations for both hatcher and customer. The custom hatcher is bound to receive a great many complaints, even though he does his work with the utmost skill, because many people believe that an egg is an egg, and will hatch if properly incubated. This is not a fact, as the hatchability of the egg is influenced by all sorts of conditions before it reaches the incubator.

The first point to insure good, strong fertile eggs is comfortable, well-ventilated Winter quarters, such quarters as will insure perfect health of the breeding fowl. In the second place, the male at the head of the pen or flock must be active, not too closely related to the hens, and must be a bird that matured quickly for the breed.

There is a good deal said about the influence of feed on fertility, and the general opinion seems to be that a too heavy green bone diet reduces fertility, and the feeding of sprouted oats works just the other way. However, the feeding ration should be such as to supply all the demands for protein, carbohydrates, etc., and a list of such rations can be obtained from your experiment stations, and good feeding schedules are often given in the columns of this paper.

It is not wise to try to hatch eggs over two weeks old, and eggs saved for hatching should be turned at least every other day, handling the eggs just as little as possible. Again, dirty eggs are not apt to hatch as well, and washing them makes the egg porous and less apt to hatch, so it is best to discard the dirty eggs entirely. These conditions may be avoided by keeping the hens confined during muddy weather and seeing that the nests have clean straw and that the eggs are gathered every hour or so.

Many eggs that come to the hatcher seem to have too hard a shell, and it is well not to over-feed shell-making rations at breeding time.

In spite of all these conditions, eggs will sometimes run very infertile and in such cases a change of males is probably the only remedy, but it is a good plan to make fertility tests in a small way several weeks before the bulk of the season's hatch is on. P. L. W.

Rough Eggs.

What is the cause of my pullets laying rough eggs, and can it be helped? Are the eggs fit to set when in that condition? W. Y. B.

New York.

I do not know that the cause of rough shells is known, or that anything can be done to help it. It would be better not to breed from fowls that persistently lay rough-shelled eggs, though an occasional one may be found in any flock. I should see that the pullets had plenty of lime in the shape of oyster shells, and should expect that the trouble would gradually disappear. Very rough shelled eggs should not be incubated as they are more porous than smooth-shelled ones and it is possible that the tendency to lay that kind may be inherited. M. B. D.

Imperfect Eggs.

I have two chicks 4½ months old, Black Minorcas. They lay eggs about the size of a pigeon's egg and no yolk in it. I got one about a month ago and three now in four days. I feed my flock, mornings whole oats and buckwheat, scattered in litter; noon I make a mash with boiled barley, wheat, bran and middlings and table scraps; night oats and buckwheat. We give them lukewarm water three times a day, have plenty of grit, old lime wall for lime, and charcoal. Is this a sickness in these chicks? Alpine, N. Y. H. V.

Small, yolkless eggs are frequently found when pullets begin laying and need cause no uneasiness. They will do better with a little practice, and your Black Minorcas should produce large, handsome, eggs such as are characteristic of this variety. M. B. D.

THE young pastor was musically inclined, and frequently sang duets with a member of his choir. Recently he arose to announce the music for the morning service, and this is what he said in his agitation: "Miss Blank will now sing, 'Oh, Had I the Wings of a Dove, I Would Fly Away,' accompanied by the pastor."—Credit Lost.

Mix Your Own Feed!

Feed HYPRO For Beef and Milk

Get Best Balanced Ration

A STREAM OF PROFITS

FOLLOW the lead of dairy experts and successful feeders everywhere and MIX YOUR OWN FEED, using pure Linseed Meal to get best balanced rations for your stock at lowest possible cost. Linseed Meal, high in digestible PROTEIN, is the secret of fat profits.

HYPRO Linseed Meal, made by the world's largest producers of Linseed Meal, is the best and purest. Makes stock thrive. Corrects digestional trouble. Its mild, laxative action keeps the digestive organs in perfect working order.

The prize cattle of the world are invariably fed on Linseed Meal.

HYPRO Linseed Meal

Highest in Protein Value — 36% Protein Guaranteed

That's why HYPRO Linseed Meal is the cheapest and best feed you can buy. Nothing but the best flax seed grown goes into each sack of HYPRO Linseed Meal.

Thoroughly sifted and cleaned to remove all impurities. Costs no more than unknown kinds. Our guarantee of 36% protein is backed by millions of capital.

Mix It Yourself

Don't buy "ready mixed" feed — **know what you get for your money.** With HYPRO Linseed Meal you can mix your own feed, get balanced rations and save big money on feeding. HYPRO, used with oatmeal and similar grains and whole milk, is the best substitute for natural milk in feeding calves. Enables you to raise them profitably.

Best Ration Book in Print—Coupon Brings it Free

This invaluable book gives you the the best rations for feeding dairy cattle, beef cattle, swine, sheep, horses and calves. Every ration has been put to the test and its value proved in actual dollars and cents. Send the coupon or a postal today for the Free Ration Book that shows the way to better feeding and bigger profits.

THE MULE AS A FARM ANIMAL.

The mule is the cheapest work animal on the farm. He suits the careless hired man and the poor care-taker. Give him a good shed, tight on the north and west, and open on the south, fitted with long racks and troughs. Keep the racks full of good hay, corn fodder or good roughage, with plenty of good sound corn, oats and bran in the trough, with a supply of fresh water, and you have all that is necessary to take care of the mule. When the mules come in from work, take off the harness, turn them loose. They will lie down and roll, get up and take a drink, another roll and then eat some hay and grain. In this way the mule eats, drinks, and rests all night, and when you are ready to work Mr. Mule is ready. All you have to do is catch him, put on the harness and hitch up. No feeding, nor currying, only see that the racks and troughs are kept clean and plenty of good feed in them. Work him hard for six months and he will be in better condition than when he commenced.

A mule will not get foundered. He will run off, but never gets hurt; he has enough wit to stop when he gets in danger or a tight place. A horse will hurt himself, break up wagons, machinery, and when scared lose any sense that he ever had. A mule will stop short in a team, lie down, roll and get up without tangling himself up in the harness. If he gets over the trace, he will not move, if it hurts him, he's got more sense. He will do more work, look better with less care than a horse and do the work better.

The young man starting farming should purchase two or three good, roomy mares 15.2 to 16.2 hands high, weighing 1,100 to 1,400 pounds, and breed them to a first-class jack 15 to 16 hands high, and raise some mules. They will pay for the farm in a few years. Mares with blood tracing to good trotting families are better than the heavy draft mares. The purebred saddle and trotting bred mares averaging around 1,200 to 1,300 pounds, bred to jacks weighing close to 1,200, produce the finest class of mules.

What the young mule eats until ready to go to work at two years old would hardly be missed. At two years old he is ready to earn his keep. A man can have a pair of young mules to sell every year and another ready to take their place in the team. Young mules are easily raised. They are less subject to blemishes and disease than horses, seldom get injured or cut in wire fences. Good, quick, active mules with good heads are always in demand, those bred from trotting-bred mares having size commanding the best prices.

I was much surprised two years ago when in the West, to see so much difference in mules. Those bred from draft mares had heavy, lop ears, short heavy necks, while those down in Kentucky had better heads, ears thin and carried up, long thin neck, with better action. The demand for first-class mules is far above the supply, and well-broken mules four years old sell anywhere from $350 to $700 per pair. Maine lumbermen have representatives in the West buying the best mules they can find, paying $500 to $700 a pair for them. This means $700 to $1,000 a pair by the time they reach the lumber camps. I have a friend who buys the mules for one of the large Pennsylvania coal companies to be used in the mines. He scours the West every year in search of mules to meet their needs. There is a market for the mule wherever there is hauling. He fills a position which no other animal can. There is nothing in sight to take his place. He is needed in the mines, lumber camps, by railroads and on the farm.

Mules are becoming scarcer all the time. Look around the country and note the number of stallions. What does this mean? Less mules. You can buy a jack that will cost somewhere from $800 to $1,500. Splendid mule jacks can be had for $1,000. A three-year-old jack is as good as one five, and is growing into money. A three-year-old should be bred to about 25 mares; a four-year-old to 50 and at six he is ready for heavy service.

Jennets cost about $400 to $500 each. Large first-class ones weighing 1,100 pounds are very profitable, when bred to the best jacks. When in Lonisville, Ky., some time ago I saw one of the most attractive animals that I had ever seen. A large crowd had collected to inspect a "hinnie," the result of breeding a jennet to a finely bred trotting stallion. The owner had refused $1,000 for this exceptionally fine specimen. No person could have guessed his breeding. The long thin ears, fine silky coat of hair, thin skin, showing every blood vein like whip cords, and intelligent head, gave every indication of both strength and quickness. He was a grand animal and could trot in 2:40. A great many "hinnies" are being raised and command prices ranging $250 to $400 each.

Mr. L. M. Monsees says, "There is nothing that walks that will beat an old jennet for money-making." A jack may earn more for one or two years, but the jennet bred to a first-class jack will become the greatest money-maker. The mule breeder always has a source of good income. "Out in Missouri," when the farmer goes to bank and wants to borrow money, the banker asks, "How many mules have you?" The farmer says, "Fifty good two-year-olds." The banker says, "You can have $5,000. So long as coal is mined and railroads are built and lumber is hauled, their will be a demand for mules." Grow mules—not one year, but every year. Mr. Mule will save you money and pay the mortgage.

Pennsylvania. G. E. MORRISON.

CHURN OR CREAMERY.

"Will it pay to make butter rather than draw milk one-half mile to creamery?"

We have a number of letters from readers who ask whether it will pay them better to make butter at home or sell the cream. It seems that this question depends on many things besides the cows or the milk. Here is an argument for the creamery. The butter makers will be heard from next.

Take your milk to the creamery. I had a session of the home butter-making proposition a season, and we would have been considerably ahead had we carted the milk to the cheese factory a mile and a half distant. The next year we found it more convenient and satisfactory to separate the milk, carry it a half mile across fields, place it on a cream route, than make butter at home. The year we made butter we received better than the market price, and the following year when cream was sold we received one cent less than Elgin. Yet the latter was a better proposition. By taking milk to a creamery a great amonnt of bother is avoided. At best butter-making on the farm is bothersome. The creamery is equipped to handle the product, and has its system of marketing. You may have an exceptionally good market, be well equipped and are familiar with farm butter-making, which would make the proposition different in your case. I would advise buying some good cream separator, then separate the cream and take it to the creamery. W. J.

BUTTER FAT AND BUTTER.

Why will a pound of butterfat make more than a pound of butter, when we know that a pound is a pound? What can I treat my straw with to keep stock from eating it? I feed plenty of hay and grain, but they insist on eating their bedding. T. W. H.

Abingdon, Md.

When we speak of butterfat, we mean the pure fat of milk. One pound of butterfat will make more than a pound of butter because in finishing the process of butter-making, water, salt, particles of curd and a small amount of ash or mineral matter are mixed in with the butterfat. The average composition of butterfat is as follows: Fat 84%; water 12.73% curd 1.30% salt and ash 1.97%. The above composition may vary slightly. When a quantity of fat is given, and you wish to estimate the amount of butterfat that should result in an ordinary churning, divide by six and add the quantity to the fat.

As to your second question, eating some straw will not hurt your stock if they have plenty of other roughage they can get at. However, if you feel sure that eating the straw is doing them harm, get one of these hand spray pumps and spray kerosene over the bedding. That will make them leave the straw alone. If you use this you must be careful not not to let any kerosene get into the milk. Washing the udder or wiping it off with a damp cloth is best to make sure. R. B.

To Make Concrete Sure

Look to the cement. It's the vital thing in concrete construction. Clean water, sharp sand and gravel—the simple ingredients—of course must be good. But when you decide on concrete you cannot be too careful in the choice of cement.

LEHIGH PORTLAND CEMENT

has a remarkably high tensile strength—due to our scientific manufacturing process.

Concrete made with Lehigh Cement grows stronger each year. "Lehigh" built structures do not deteriorate with age or depreciate with time. They endure from generation to generation.

Send for our book, "The Modern Farmer". It explains Lehigh Cement and gives complete information on how to build a concrete watering trough and other farm structures.

LEHIGH PORTLAND CEMENT CO.
501 Young Bldg., Allentown, Pa.
105 Consumers Bldg., Chicago, Ill.

Build your Silo of concrete. It will be waterproof, weatherproof, fireproof, ratproof, and will keep your ensilage in perfect condition.

The Henyard.

Rattling in Throat.

I have a cock bird that has a rattling in his throat, not a continuous rattling, but at times it is worse than others. He eats well, eye is bright and otherwise seems all right. I have tried washing throat with peroxide but did no good. He is a fine R. C. Red from a great laying strain. I would like to use him this season for a breeder. He will be two years old in the Spring. Can you give me a remedy? H. H.
Indiana.

The trouble is not in the throat, but in the respiratory passages, and is probably due to an accumulation of mucus, either from an ordinary cold, or from some other cause of inflammation of the respiratory tract. Try injecting a few drops of kerosene diluted with an equal quantity of olive or sweet oil into the nostrils and the cleft of the palate, or kerosene alone may be used. A small syringe, medicine dropper, or oil can may used for this purpose. Then keep the bird where he will not be exposed to dampness or to drafts of air while on the perch. M. B. D.

Picking Out the Profit Makers.

To the breeder whose heart is in the work comes the sore trial of having to cast aside a bird whose trap-nest record shows her to be high class, but whose stamina has not proved equal to the drain on her system, making her worthless as a breeder. The ordinary farm flock produces an average per hen of perhaps 60 to 70 eggs per year. Cases are quite common where the trap-nest shows records as high as 240 to 280 eggs per year. The latest from the Oregon Experiment Station gives the top record as 303. The 200-egg hen is therefore quite within the bounds of reason.

The average town or city dweller who desires to keep a dozen or more fowls ask first: "What breed shall I keep?" Later, when he has learned more about the egg machine, he will ask: "What strain shall I keep?" It's the strain, not the breed, when a large egg yield is sought.

It is conceded that the White Leghorn as a breed produces the largest number of eggs. Two comparative illustrations taken from actual figures obtained during the past 12 months will show the difference between an ordinary White Leghorn and a White Leghorn that has been scientifically line-bred and trap-nested for Winter eggs through a number of generations.

The ordinary commercial egg farm carrying from 1,000 to 5,000 layers cannot afford to trap-nest the entire flock during the pullet year. An equipment of trap-nests, and the labor incident to their proper care will not warrant the expense except in rare instances. A system, however, which will build up the general average of the flock and one which may be practiced by all breeders is to equip a small pen with trap-nests. If the plant carries 1,000 layers a pen to hold 50 birds and 10 trap-nests is ample. In September or October, when the pullets are gathered from the range place 50 of the best-developed birds in this trap-nest pen. By March 1 your records will show from five to 15 birds that are heavy Winter layers. Select the finest cock bird you have and save a sitting of eggs from the most vigorous pullet of the 15. If the bird chosen is also the heaviest layer so much the better. Select for stamina first and heavy Winter egg record second. Hatch this sitting of eggs, toe-mark the cockerels and sell their sisters off the place. When these cockerels are one year old the five or 15 selected trap-nesters will be two years old, and will be mated with the finest bird found with a toe-mark. Eggs from this mating will be hatched separately and the resulting cockerels used for the following Spring's breeding pen. If your breeding pen contains 300 two-year-old hens, select 30 of the finest cockerels and throw in with the flock 10 days before eggs are desired for hatching. Cockerels intended for one breeding pen should always be together from the time they are six weeks old. With proper housing and feed, breeding pens handled in this way will produce eggs running 92 to 97% fertile, and each year will show a higher egg yield per hen.
G. H. STRONG.

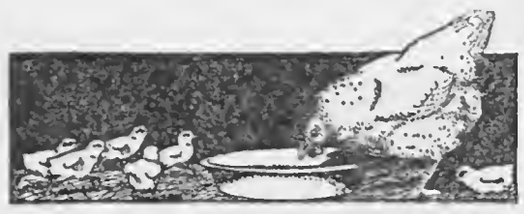
Pulping Mangels in Cider Mill

On page 275 F. M. P. asks for some machine to pulp mangels. Two years ago I raised quite a lot of these beets. One of our neighbors, who was moving to town, had an old cider press and told me if I wished I could have it for moving it. I have a three horse-power engine which I used to run it and found it made mangels into fine feed for cows or chickens. Some of the pieces will be too large for chickens to swallow, but will be so torn up they can easily pick them to pieces. I also used quite a lot of beets by sticking them up on nails and letting chickens pick them to pieces themselves. If F. M. P. keeps large flocks of poultry and has ground where he can raise beets, I think he will not be disappointed in an old cider mill to grind them, as they make a good feed cooked in an old kettle and mixed with bran or meal for a mash in cold weather. The mill I speak of is hand power and can be turned by hand as well as by power but as I had power I used it instead.
Gap, Pa. R. W. H.

R. N.-Y.—Last year we heard from a man who ran mangels through the silo shredder with the corn. The shredder pulped the beets and mixed this pulp with the silage.

"HERE'S dat dog you done los'," said Mr. Erastus Pinkley. "Yes," replied Uncle Razbury; "dat sho' is him." "Aain't you g'ineter gimmie no reward foh bringin' 'im back?" "Sho, I is. You kin keep de dog."—Washington Star.

"Now that you have agreed to marry me, dearest, I presume I had better ask your father's consent." "You may if you like, but it isn't at all necessary. I am in the habit of doing exactly as I please." "Oh, in that case, perhaps I'd better consult your father about the advisability of not marrying you then."—Detroit Free Press.



Why Feed Young Chicks Raw Grain?

It's just as easy to get a ready-cooked feed. Simply ask your dealer for H-O Steam-Cooked Chick Feed. You have no bother—we do the cooking at the mill. You will find H-O Steam-Cooked Chick Feed is far and away the best feed for chicks you ever tried.

H-O Steam-Cooked Chick Feed

is a scientific mixture of Corn, Cut-Oatmeal, Cracked Wheat, Kaffir Corn, Peas and Millet—*steam-cooked* by a special process in our mill.

Sold only in 10-lb., 25-lb., 50-lb. and 100-lb. bags, with tag showing guaranteed analysis. If you cannot get H-O Steam-Cooked Chick Feed, Intermediate Scratch, Scratch Feed, Poultry Feed, Dry Poultry Mash or Chick Feed from your dealer, write for samples and prices.

The *Best* Barn Equipment *Pays for Itself*

DON'T spend *wages* over and over again for work that Star Barn Equipment will do quicker, better, and at a *fraction of the cost.* With Star Barn Equipment, a single investment pays for a lifetime of service. The *saving* in wages, work, and time wasted, pays the cost of installation the *first year!* And you get *free* all the advantages of a cleaner, more sanitary, better kept barn. Let us prove our claims by mailing you our Book *FREE.*

STAR

Stalls and Stanchions— ★ **Litter and Feed Carriers—**

The most comfortable, durable, and in the end the most economical Stalls and Stanchions in existence.

Built in Units. Get one or a dozen as you need them. Let your *Equipment* grow with your *herd.*

The Alignment device keeps cows lined up at the gutter, keeps the cows clean and comfortable and makes it easier for you and for the help.

Giant Star Stanchions begin to improve where others leave off. Labor-Saving, one-hand lock that stays locked—Patented Lock Guide—Sure-Stop—instant and easy adjustability to all neck widths — smooth wood lining firmly held in a "U bar;" these are a mere few appealing Star features that should make you insist on Giant Star Stanchions.

The speediest, easiest raising and lowering and most *trouble-proof* carriers on the market. *Roller Bearing throughout.*

Patented exclusive features make Star Litter Carriers the biggest Sellers and the best Servers on the market. No matter how your Stalls and Gutters are arranged, there's a Star Litter Carrier just the thing for you. Our new patented Curves and Switches make Star Litter Carriers practical everywhere.

Six different styles and types to meet every requirement. Made for Rod and Rigid Track.

The Star Swinging Boom does away with posts and supports in the barnyard.

Find out all. These Litter Carriers pay their cost the first year. Let us prove it.

PUBLISHER'S DESK

I spent $3 last Fall to go to the State Fair to shake hands with Collingwood, but he kept hidden. I commenced with the first issue. There are not many of us left. W. B.

New York.

This good friend began to read THE R. N.-Y. before Mr. Collingwood or myself were born; but we always feel a filial sentiment for the men who began at the beginning and stayed with the paper through all these years. We would consider shaking hands with a number of them sufficient return for a trip to the fair. By the way, it would be interesting to know how many of these old friends are yet with us and able to attend the fair. We would like to have them as our guests at a luncheon on the Fair Grounds next September. How many can come? It would be the pride of our lives to have a big number, and the good wives that are left with them.

Do you think the Empire Realty & reliable source to borrow money from?

Ohio. J. B. F.

Mortgage Company, Richmond, Va., a

This company advertises to loan money at five per cent. But if we understand their literature, you must first make contracts with them in $500 amounts or multiples of $500 and send them $4 a month on each $500 certificate until the loan is made. In no event can the loan be made short of six months, and there is no promise in the literature that we can find that it will be made in six years. The application simply becomes eligible for a loan in six months. The inference is that they may not have the money to make the loan at that time and you will have to wait until they have it or until they get good and ready to make it, if such a time should ever come. They make it appear as a desirable feature to make the mortgage payable in 10 years by paying monthly semi-annual or annual payments. The amortization principle is a good one, but we would not encourage farmers to bind themselves to pay one-tenth of the mortgage each year. A payment of one per cent. with the privilege of paying more would be all right. This looks to us like the Birmingham, Alabama, scheme previously referred to. The purpose there seemed to be more to get money in on the certificates than to loan it out on farm mortgages.

A good friend sends us a certificate for $25 issued by the Seminole Land & Investment Company and says we may use the proceeds to fight fakers. The fakers would be safe themselves in making such a donation. The certificate is a good specimen of a fake itself. The $25 are to be allowed on the purchase price of any lot bought at St. Cloud, Fla. In other words, you buy a lot and pay more than it is worth, probably several times over, and you will be allowed $25 as a sop to your injuries. The certificate is intended to make you feel you are getting something for nothing, and if you take the bait, you will feel the barb on the hook later on.

Enclosed find an acknowledgment from W. W. Wittman & Co., 16 W. Pratt St., Baltimore, Md., for two bushels of Virginia natural peach seed. We have written to them three times and can get no answer since the enclosed letter. We sent an order last year and received the seed right away, but this year we waited on them over a month and heard nothing. Will you see what you can do with them for us? D. S. A.

Pennsylvania.

This order was sent early in September, and November 24 the subscriber writes us he received them. If a firm could realize the advantage they would gain by acknowledging an order promptly or advising a customer that there was some necessary delay, a report of this kind would not come to us. With an unexplained delay of this kind a farmer does not feel inclined to send this house an order another year. We were as unsuccessful in getting replies to our inquiries as to the cause of the delay, but the goods were shipped. Farm operations are sadly upset by delays of this kind, but it is more the anxiety as to whether the goods will come in time for the season's use that causes annoyance and dissatisfaction to the farmer.

We have some inquiry and some criticism of the farm mortgage written by the Woodruff Trust Company, Joliet, Ill. The principal feature of the mortgage may be found in the following paragraph from the company's literature:

The interest charged to the farmer is at the rate of 6% per annum, and for each $1,000 borrowed the amount of the semi-annual payments, including both principal and interest, will be $43.62; so that by paying $43.62 semi-annually for 20 years the farmer is entirely out of debt. In paying the principal and interest covering a period of 20 years he has only paid out $1,730.40. If under the ordinary plan of borrowing money the farmer were to borrow $1,000 at even so low a rate as five per cent. per annum for 20 years, he would have paid out $2,000 at the end of this time, and of course in addition to this he would have paid out a considerable amount of money in renewal commissions and legal expenses.

One intelligent criticism from an Illinois farmer is the following:

The company loans the farmer $1,000 for 20 years; but the farmer pays six per cent. semi-annual interest on every dollar owed, and also pays the principal to the last cent within the 20 years. The comparison of their 6% loans with a 5% loan making out a saving to the farmer of $269.60 is not all that it seems on the surface. The farmer does not use their $1,000 for the full 20 years, but they estimate as if he did. This company charge the farmer 6% for every dollar of their money for every day he keeps it. In addition he is compelled to pay a part of the principal each year, whether he wants to or not.

The Woodruff Trust Company simply enforces thrift by insisting on a payment of part of the principal every six months. The only other advantage is the long term and consequent saving of legal expenses and commissioners for renewals of short term mortgages. As an offset to this, the company charges six per cent. interest, while in some cases at least the borrower may be able to get the use of money for five per cent. The apparent saving of $269.60 on a 20-year mortgage does not allow the farmer any credit in the calculation, for interest on the payments made every six months. The borrower pays six per cent. interest on the balance remaining due from payment to payment. The portion of the fixed semi-annual payment credited to principal increases every six months; and the amount credited to interest decreases in an equal proportion. The interest on $1,000 for 20 years at 6% is $1,200. By paying part of the principal from year to year, the borrower stops interest. The interest on these payments would amount to $469.50 at 6%. The principal of the contract is good; but the rate of interest is high. It is assumed that much of the money used by the trust company is the deposits of farmers and others in the neighborhood. They probably draw from three to four per cent. interest. The trust company of course, profits by the difference. In the cooperative associations of Europe the money goes direct to the associations at the low rate, and the borrower gets the benefit. Banks and trust companies must look out for their profits. Coöperation seeks only the benefit of its members, and we hope yet to see the mortgages of American farms financed on the coöperative plan.

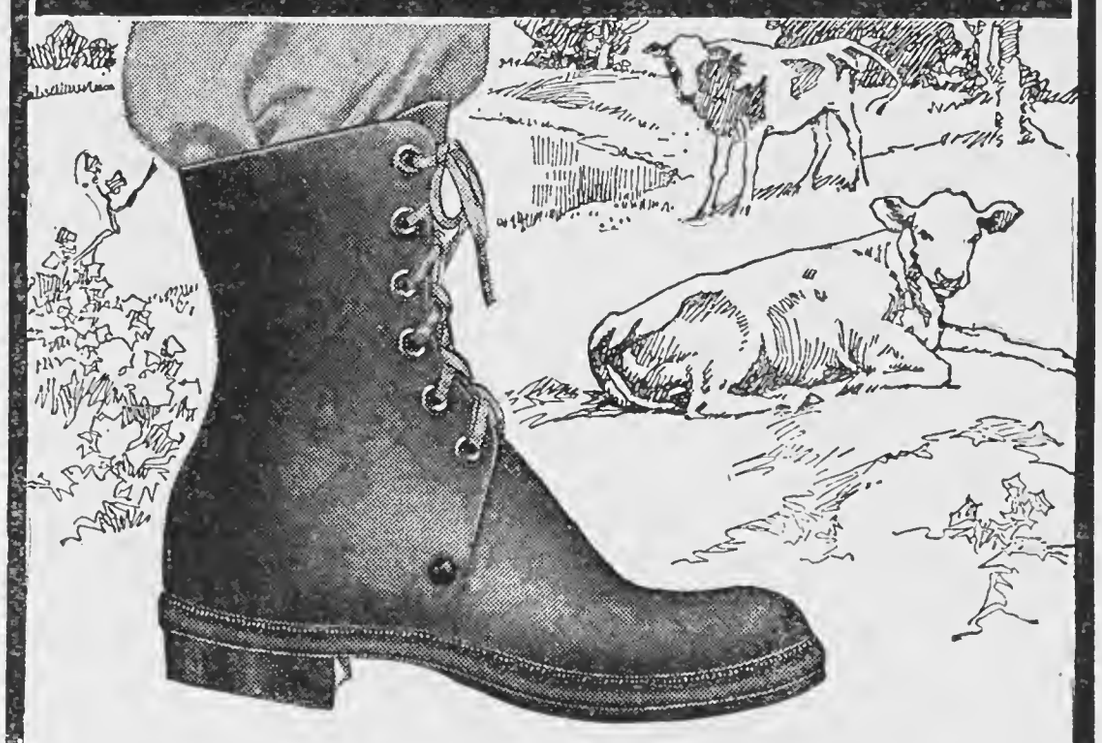
I have noticed the complaint from Hammonton, New Jersey, and your reply. You cannot expect anything but the curses of the dishonest, but you will have, or should have, the support of all decent men. M. P. B.

Virginia.

That is about right. THE R. N.-Y. cannot expect the approval of crooks, and there is no record that it ever received such approved or that it merited such approval. Let the rogues curse. J. J. D.

LITTLE John was full of mischief and during his first year at school hardly a day passed that he was not sent to stand in the corner. When the schoolhouse burned down and a new one was immediately begun, the little boy went to his father, who was County Superintendent. "Don't you think we could get the carpenter to build a *round* schoolhouse this time, father?" he said. "Why, son?" his father asked in astonishment. "Because," the little fellow answered, "I'm getting *very* tired of corners."—N. Y. Evening Post.

"Better than leather For all kinds of weather"



Your Footwear Problem Solved

Leather is growing dearer every day. Leather shoes cost more than ever before. Yet how to get satisfactory work shoes—at a low yearly cost—is no longer a puzzle. **The Hub-Mark Bootees** are the answer to that footwear problem.

Hub-Mark Bootees are made of the best grade of New Rubber and A1 Duck with leather insoles. They are reinforced at every point where the wear and the strain comes.

Buy a pair of these comfortable work shoes. Work day in and day out beside men who wear leather shoes. When their shoes are cracked, split, and useless yours will be solid. Bootees are cheaper than shoes made of leather, because they always outwear them.

Note this:—Look for the **Hub-Mark** on all kinds and styles of rubber footwear for men, women, boys and girls. You can rely on anything you buy from dealers who sell **Hub-Mark Bootees**—they are square dealers.

BOSTON RUBBER SHOE COMPANY, Malden, Mass.

HUB MARK

ELLIS ENGINE CO., 6 Mullett St., Detroit, Mich.

Eureka Mower *Write for free Catalog*

This machine has the one right cutting principle—center draft. Cutter bar is directly in front of wheels—mows back and forth on one side of field in any direction. No side draft. Cut crop is left in standing position and cures rapidly. One-third saving in time and labor. The Eureka Mower abolishes tedding and trampling of cut crop. It's the ideal mower for orchard and working between rows. Will cut weeds in pastures and brush that no other mower will handle. 5 sizes for one or two horses. 48 years on the market. Machines bought 30 years ago, and used every year, still in use. Prompt shipments. Write to-day.

EUREKA MOWER CO.
Box 868, Utica, N. Y.

MORE MONEY EASIER AND FASTER WORK

You lose $1.00 on every six sheep you shear in the old way. The Stewart gets a length and quality of wool that brings the highest price. Extra profits soon pay for it. The Stewart has ball bearings in every part where friction or wear occurs. Has a ball bearing shearing head of the latest improved Stewart pattern. Its price complete, including 4 combs and 4 cutters of the celebrated Stewart quality is $11.50.

STEWART'S No. 9 BALL BEARING SHEARING MACHINE PRICE $11.50

gets all the wool and takes it off quickly and smoothly in one unbroken blanket. To shear with the Stewart Machine seems like play to those who have labored with hand shears in the old, hard, sweaty way. You don't have the same swollen aching wrists. You don't scar and disfigure your sheep with uneven shearing and spoil the wool with second cuts like you used to do. **Get one from your dealer,** or send us $2.00 and we will ship C. O. D. for balance. Money back if you are not well pleased.

Stewart Ball Bearing Clipping Machine
For Horses, Mules and Cows

It pays to clip horses and mules in the spring—they look and feel better, do more work, rest better and get more good from their feed. Clipping the flanks and udders of cows prevents the dropping of filth into milk. The Stewart can be used for clipping horses, mules and cows without change. It's the easiest to turn, does the fastest work, stays sharp longer and is the most durable. **Get one from your dealer,** or send $2.00 and we will ship C.O.D. **PRICE** for the balance. Money back if not well pleased.

PRICE $7.50

PRODUCTS, PRICES AND TRADE.

(*Continued from page 543.*)

The Census Bureau states that we raised 7,383,557,500 pounds of cotton in 1913. Its total value, including seed, will be about $1,000,000,000, or $80,000,000 more than last year.

I enclose New York quotations on imported eggs, 29 cents: State, 26, and would like to know why European eggs, which are on the water a week, and several days before that getting to steamer, should bring several cents more than ours which are in New York 10 hours after express company gets them, and we are sending every day so they must be fresh. S. L. P.

Cayuga Co., N. Y.

The quotation referred to, from an up-State newspaper, is either a typographical error or an item that has not been revised for several weeks, when eggs were much higher. At present there are but few European eggs on this market. Some are on the way, expected to sell at about 22 cents if they show up well on arrival.

Is it a business proposition to import eggs in natural state from Germany or Eastern Russia? If so, is it practiced by egg dealers and how can the eggs be compared with the native product.

Massachusetts. N. B.

Some eggs have been shipped to New York from Germany and Russia during the past season. Part were fresh and part limed or otherwise preserved. The quality was only fair and price ranged from 20 to 25 cents at time when good native eggs were bringing 10 to 15 cents more. There may be some future in this business, but it can be profitable only at times when eggs are scarce and high here. There is always risk of considerable damage on shipboard from heavy weather or heating.

A coming industry in salmon and weakfish has been started in Greenland. The output last year was about 3,000 one-pound cans. W. W. H.

WORLD'S CROPS.

The U. S. Bureau of Statistics states that the world's reported corn area is about 170,000,000 acres, 130,000,000 being in North and South America. The United States planted 105,000,000 acres and Argentina, 10,000,000. Southern Europe grows about 30,000,000 acres, mainly round flint varieties. Nearly 4,000,000 acres are planted in Italy. Hungary and the adjoining States produced 500,000,000, on 20,000,000 acres. Roumania, Bulgaria, Servia and Russia export from 50,000,000 to 80,000,000 bushels. At present Argentina exports the greater proportion of its corn, sending 4,600,000 bushels to the United States during the last four months of 1913, the price of this corn at New York ranging from 73 to 80 cents per bushel, which was somewhat less than our native corn brought. The Argentine corn is mainly small kernel flint.

The area in oats is about 144,000,000 acres, 85,000,000 in Europe, 38,500,000 in United States, and 10,500,000 in Canada. European Russia alone exceeds the United States with 43,000,000 acres. The per acre yield in Canada last year was about 40 bushels, United States, 30; Argentina, 40; Germany, 60; France, 32; Italy, 35; Russia, 28.

Russia leads in production of barley, the last crop being 574,118,000 bushels, on an area of 31,197,000 acres; United States, 178,189,000; Austria-Hungary, 158,628,000; Germany, 188,709,000; Spain, 68,772,000; Great Britain, 67,727,000; Japan, 101,119,000 bushels.

Rye covers about 108,000,000 acres, 95 per cent. being in Europe. Russia produces far more than all other countries together, 1,002,468,000 on 74,990,000 acres; Germany, 481,169,000; Austria-Hungary, 164,574,000; United States, 41,381,000.

The world's potato yield averages about 5,945,846,000 bushels. Germany producing 31 per cent. of this on 8,257,000 acres. Russia exceeds Germany in area, 10,975,000 acres, but falls nearly 500,000,000 short in yield. Other large acreages are: Austria-Hungary, 6,013,000; France, 3,863,000; United States, 3,711,000. Only 28 per cent. of the German crop is used for human food, the remainder being fed to live stock or distilled.

Argentina has about 3,716,000 acres in flax; British India, 3,757,000; Russia, 3,428,000; and the United States and Canada 4,873,000 acres. The yield of seed from these countries is about 96,000,000 bushels.

The ground has been frozen up and covered with snow for six weeks; the first good sleighing snow to last anytime in 20 years. The last week of January and about three days in February warm, and farmers plowed a good many acres; none since. Selling of milk by farmers is in the increase to the ice cream establishments and to the stores in coke region; 85 cents for 20% cream, or 25 cents per gallon for whole milk. Tree fruit, especially peaches and cherries, badly killed; wheat tops very brown but root looks all right. Grass so far very nice, also strawberries, as there has been no freezing and thawing. Cows are scarce and high. Buyers are bringing in from other counties, and holding sales where they run anywhere from $70 to $115. Good horses high and scarce. Corn, home grown, pretty well used up.

Dunbar, Pa. J. T. S.

All reports of examination of peach buds show no life in them, caused first by the warm weather in December and January swelling the buds and making them more tender, then in February 10 to 20 degrees below zero. Even the hardier kinds are almost entirely killed.

Ashtabula, O. W. C. B.

Prices for week ending March 21: Timothy hay $12.50; clover hay $10; mixed hay $11.50; straw $5.50, delivered to elevator, baling paid for by purchaser. Oats 36; corn 80 per cwt.; wheat 91; clover seed $7.25; steers 6½ to 7; hogs, dressed $10.60; potatoes 80; eggs 18; hens 13. H. H.

New Haven, Ind.

Plenty of snow at present, but it will soon have to go now. There are a great many sales at this time here, so many people moving to better themselves of course. Good heavy sound horses are bringing $250; cows are very high, $60 to $100 each. A cow with black and white color brings the highest price, regardless of some other point that she might lack. Cabbage $20 per ton; hay $14; potatoes 60 per bushel; butter 25; eggs 23. W. D. S.

Newfane, N. Y.

Corn 75 to 80; we had only half crop. Oats 37; wheat 95 to $1, half crop; bran $1.25 at mill; Timothy hay $15; clover hay $13; potatoes $1.10. Milch cows $40 to $60; calves $9; horses $125 to $150; sheep $4; lambs $5 to $7; beef cattle $7 per 100; hogs $7 to $8.40; butter 20; milk 20; skim-milk 10 cents per gallon at farm. Eggs 25; chickens 12 cents; young roosters 9; young chickens 15 and 16. Gardening crops only for home consumption; a good many apples raised here. I have about 1,200 trees; had a half crop last year, but did not ship to commission house, stocked them myself and sold them at $1 per bushel this Winter. I have a good many cherries, plums and peaches, which we sell on farm for good prices. Grapes bring 2½ to three cents per pound on farm. We make a good many ties, prices are for black oak 28 cents; white oak 45 cents apiece; props, black oak five to seven cents, white oak 9 to 10 cents apiece. We have a good deal building material made which brings us $15 per 1,000. In Summer we keep boarders from city, so make good home use of our vegetables, fruits, eggs and butter. A. B.

Bourbon, Mo.

Fish Bite Like hungry wolves any time of the year if you use **Magic-Fish-Lure.** Best fish bait ever discovered. Keeps you busy pulling them out. Write to-day and get a box to help introduce it. Agents wanted. **J. F. Gregory, Dept. 99 St. Louis, Mo**

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

DO YOU NEED FARM HELP

We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. Ours is a philanthropic organization and we make no charge to employer or employee. Our object is the encouragement of farming among Jews. **THE JEWISH AGRICULTURAL SOCIETY, 176 Second Avenue, New York City.**

Subscribers' Exchange

SHENANDOAH VALLEY FRUIT AND TRUCK Farm, within mile of Military Academy; female seminary, and high school buildings. Address PRIVATE BOX, N. End Kent, Winchester, Va.

WANTED A FARM—No less than 10 acres, about 50 miles from New York, about two miles from railroad station; give full description. GEO. DELECOURT, Spring Valley, N. Y. Box 530.

WANTED—Small dairy and fruit farm, 25 to 100 acres, good tillable soil, conveniently located in Orange, Ulster, or Dutchess counties; terms cash. Address L. B. S., care R. N.-Y., 333 W. 30th St., New York.

FOR SALE—260-acre dairy farm, with stock and tools; double house for two families; roomers or summer boarders; fine summer home; for photo. and description address G. C. VALENTINE, Deposit, N. Y.

FRUIT, TRUCK, POULTRY FARM FOR SALE—36 acres, excellent location and market; good buildings; all kinds fruit; strong soil; with or without stock, etc.; buy direct, saving commission. HOMER TWEED, Quakertown, Pa.

FOR SALE—570-acre farm, Brunswick County, Va.; splendid ten-room dwelling; all necessary out-buildings; one mile from depot; on good improved road; good land. Address N. F. NEBLETT, Meredithville, Va.

120 ACRES, NEW MEXICO—Grows anything; fruits, vegetables, Alfalfa; delightful climate; abundant pure water; near prosperous county seat and railroad; price reasonable. GEORGE SUMMERS, Inter-Southern Bldg., Louisville, Ky.

FOR SALE—Boarding house and dairy farm, 128 acres; stables for 44 cows; milk station on farm; house has 30 rooms; accommodates 50 guests; modern conveniences; telephone; price $11,000. Write for photos. and terms. Address OWNER, Willow Brook Cottage, Wallkill, N. Y.

MODEL POULTRY FARM—Successful business proposition, fully equipped with thoroughbred stock; 35 acres; capacity 3,000; large dwelling, mile from railroad; profits will return 20 per cent. on investment; $15,000, part cash. BOX 256, Beverly, N. J.

FOR SALE—One of the best farms in the Connecticut Valley; 125 acres, stock and tools included; 12-room house; plenty of out-buildings; barn 42x84, with basement; running water at house and barn; plenty of wood, lumber, fruit, cherries and berries of all kinds. Address M. HOLMAN, Unionville, Conn.

SPECIAL FARM FOR SALE—91-acre farm, 1¼ miles from Quakertown, near trolley line; bank barn for 30 head, and other outbuildings; plenty of fruit, good water; six acres of woods; all fields machine worked for quick sale, $6,500. IRWIN NEIL, Quakertown, R. D. No. 2, Bucks County, Pa.

100-ACRE FARM FOR SALE—18 miles from Boston, near two fast trolley lines and railroad; all fields machine worked; fine old 11-room house, with all modern improvements, shaded by four magnificent elms; new barn, some fruit; productive land; good roads; best of markets. M. L. FESK, Billerica, Mass.

FOR SALE—Farm of about 140 acres, situated in suburb of large city; 50 acres or more hard wood, fit to cut; farm will carry 25 cows, and milk sells at 5½ cents a quart at farm, 9 cents at city, 25 minutes' drive away. Here is a place the right man can make good money with, and the probable increase in the value of land will be large in near future. $5,000 down and balance as agreed. Address BOX 254, New Bedford, Mass.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

POULTRYMAN—experienced, single, reliable; best references. WEIN, 306 Ninth Ave., New York.

YOUNG MAN, 21 years, wants position on poultry farm; experienced; doesn't drink or smoke. DROUT, 24 Edson St., Corona, N. Y.

FARM HANDS WANTED in institution work; salary $32 a month and maintenance to begin with. Address SUPERINTENDENT, Letchworth Village, Thiells, N. Y.

WANTED—White woman for general housework on farm; three adults; no outside work; reference given and required; $5 a week. SIGNAL FARM, Sewickley, Pa.

WANTED—Capable, experienced, general housework; country, where few boarders are kept; reference given and required. K. H., Montgomery, N. Y.

FARM MANAGER WANTS responsible position, or will buy or rent good dairy, poultry, fruit farm. H. J. L., care R. N.-Y., 333 West 30th St., New York.

YOUNG WOMAN must be out of city next two months; will help in house or garden; salary secondary. M. B., care R. N.-Y., 333 W. 30th St., New York.

1912 GRADUATE of New York State College of Agriculture desires responsible position; good references. W. N. J., care R. N.-Y., 333 West 30th St., New York.

POSITION WANTED—Young man, 21, intelligent, ambitious and desirous of learning farming; willing worker; mother good German cook. J. McGUFFIN, 191 St. Nicholas Ave., New York City.

TWO AMBITIOUS HIGH-SCHOOL GRADUATES wish positions, together or singly, on farm this summer; right young men for small farmer wishing help; wages no object. A. FINK, Ridgefield Park, N. J.

WANTED POSITION to care for boats and machinery, gentleman's estate; licensed engineer, pilot, hunter; carpentering; sober, industrious; satisfaction guaranteed. Address O. H. C., care R. N.-Y., 333 West 30th St., New York.

WANTED—Position as manager of large farm or orchard; would like to become partner or owner if satisfactory; best of references; am natural horticulturist, with training and practice and executive ability. A. E. JOHNSON, Iola, Wis.

YOUNG MAN—Practical farmer, with scientific and business education, desires position as secretary or assistant to owner or manager of large farm or farm corporation; single; highest references. Address SECRETARY, care R. N.-Y., 333 West 30th St., New York.

TEMPERATE, PRACTICAL MANAGER, with some technical training wanted immediately for modern 170-acre farm; Alfalfa, potatoes, cows, pigs; desirable, permanent place for party willing to demonstrate at reasonable salary for first year. A. F. HOWES, 6 West Market St., Wilkes-Barre, Pa.

POSITION WANTED—As manager of gentleman's private estate by experienced married American, small family, 32 years old; thoroughly understands all branches of farming, gardening and greenhouse work, and can furnish best of references; eight years in charge of present position. THOMAS A. CLARK, care of Burnett Bros., New York City.

WANTED—Potato planter and digger. FRANK HARDING, Milford, Mass.

FOR SALE—14 Prairie State Universal hovers with regulators, 1913 model, $4.25 each. Just half price. H. BACON, Berwyn, Maryland.

FOR SALE—25 International Hovers; used season 1913; $6 each. W. H. SCHROM, Berwyn, Maryland.

WILL EXCHANGE a new No. 12 DeLaval Separator for good 6 horse-power gasoline engine or registered Jersey heifer calf. L. A. CATHER, Fairmont, W. Va.

BUY OF THE FARMER—Coarse Timothy Hay. CHANDLER BROS., New Gloucester, Me.

PURCHASE ALFALFA HAY direct of the producer and save money. F. P. ERKENBECK, Fayetteville, N. Y.

WANTED—A carload of Alfalfa or Clover Hay; state price and quality. J. W. MILLER, Princeton, N. J.; R. D. 2.

THE ONONDAGA COUNTY FARM BUREAU is prepared to quote prices on Alfalfa, Timothy and Clover hay. 112 COURT HOUSE, Syracuse, N. Y.

FARM—168 acres, best corn land, $100 per acre. Address owner, D. E. CHILD, Findlay, Ohio.

FOR SALE—My farm of 245 acres; particulars address R. N. FAIRBANK, Bernardston, Mass.

93 ACRES and 12 ACRES—Two acres in grapes. Inquire N. M. KISTLER, Emporia, Va.

30 ACRES good land for $250. M. RIGEL, Yellow Pine, Ala.

FOR SALE—46 acres fruit farm. J. C. SYVON, Sheridan, Oregon.

WANTED—Good 50-acre farm for fruit, with buildings, water; state price and full particulars; no agents. G. H. S., 405 Fourth St., New York City.

46 ACRES—Fine cultivation; large house and barn; all kinds fruit trees, strawberries, never-failing water. HATTIE C. BENDER, Halsey Valley, N. Y.

FOR SALE—80-acre irrigated farm in Idaho fruit belt, close to electric car; telephone and R. F. D.; live stock, machinery; easy payments. Address owner, G. PRIMBS, Caldwell, Idaho.

"'Sal-Vet' results are entirely satisfactory. I bought it to rid my sheep of worms, and it certainly did the business. Also fed it to horses, colts and cows, and they are all doing finely."
L. J. ALLEN,
Willseyville, N. Y.

"Some of our neighbors have lost all of their pigs, and some of ours were not doing well, either; but since feeding 'Sal-Vet' to them they are doing fine." ISENBARGER BROS.,
Rt. No. 2, Battle Creek, Mich.

"I had two lots of hogs. To one lot I fed 'Sal-Vet'; was pleased with results, as they went to market in fine condition. To the other lot I fed no 'Sal-Vet.' These hogs did not fatten nearly so well, and at killing time we found many worms in them, while those that had the 'Sal-Vet' had no worms.
I have good faith in my hogs. They look well; but I also have faith enough in 'Sal-Vet' from my experience to believe that it will make them look better." ELWOOD CROSSLEY,
Rt. No. 1, Bloomsburg, Pa.

"I lost fifty dollars' worth of lambs from worms. Am sure that if I had had your 'Sal-Vet' sooner it would have saved me this fifty dollars, as I have not lost one since I began feeding it. Have also been feeding 'Sal-Vet' to a bunch of shoats; they are now the finest in town.
W. A. TOBY,
Lindley, N. Y.

"I lost a number of hogs, and more were dying; then I sent for your 'Sal-Vet.' Fed it to them immediately upon its arrival, and they at once picked up and are flourishing and thriving like the biblical 'green bay tree.' We have been killing some of these hogs and selling them for more than the market prices. If it had not been for the 'Sal-Vet' fed them, I am sure that we would not have one left to sell."
EDWARD F. DIBBLE (Seedgrower),
Honeoye Falls, N. Y.

"I have kept hogs all my life, and have fed lots of grain to make them grow. I sold one lot of hogs before I got the shipment of 'Sal-Vet,' but kept an equal number. I fed 'Sal-Vet' to the latter for two weeks, and while they were not as old as the first lot, I sold them and they weighed 250 pounds more than the oldest whieh had not had 'Sal-Vet'."
JOHN E. SEVERENCE,
Savannah, N. Y.

I'll Feed Your Stock 60 Days Before You Pay

I'll Stop Your Losses From Worms Or No Pay

I'll Prove It On Your Own Stock

I don't ask you to pay me one single cent until you have fed SAL-VET for 60 days and seen with your own eyes it's wonderful merit. I don't ask you to send me a penny **until I prove to you, on your own stock,** the great value of SAL-VET as a worm destroyer and conditioner. I have shipped tons and tons of SAL-VET to readers of this paper who have accepted my "no money down" offer. I want an opportunity **to show you** who have not yet accepted it, that it pays, and **pays big** to feed SAL-VET regularly to all your farm stock — Hogs, Horses, Sheep or Cattle. You have nothing to risk — everything to gain.

The Great Worm Destroyer

TRADE MARK

SAL-VET

REG. U.S. PAT. OFF.

The Great Live Stock Conditioner

makes all animals **thrive better, look better,** destroys and expels intestinal and stomach worms which prey on the digestive tract, **robbing** your animals of vitality and strength and keeping them in an unthrifty, unprofitable condition. SAL-VET will put them in condition to get more good out of their feed—makes them thrive faster — stops your losses from worms, makes stock sleek in coat, vigorous in action, and far better able to resist diseases. Millions of dollars are lost every year by stock raisers who do not keep their animals worm-free, healthy, and in a condition to get all the benefits of the rations fed.

My Best Advertisement Is A Pleased Customer

"I am as strong for SAL-VET as ever. Almost every one, in these parts, has lost hogs, but mine are still doing finely, thanks to SAL-VET." Dick Crookham, Lacey, Ia.

"SAL-VET has been a great help to my hogs as none have died since I fed it, although previous to its use, I had a number of losses T. J. Reed,
Rt. No. 1, Hutton Valley, Mo.

"Hog cholera has swept this part of the country, but for the first time in years, my own hogs escaped. I have been feeding SAL-VET and now I would not be without it for double the price."
Thomas Fitzgerald,
Rt. No. 2, Connersville, Ind.

"I took some of my poorest and weakest pigs, shut them up in a lot by themselves, and fed them SAL-VET in order to make a test. I found SAL-VET all you claim. These pigs are now good, strong, healthy shotes, weighing 125 to 150 pounds. I shall always feed SAL-VET the year 'round."
W. A. Kearn, Rt. No. 1, Tampico, Ills.

"Your SAL-VET is certainly all to the good, and you may always count on me to be a booster.
When the SAL-VET arrived, our hogs were either all sold or dead with cholera. There were five little runts alive, which were considered as good as dead, but, thanks to SAL-VET they are the best looking hogs of their age in the neighborhood.
My one regret is that we did not get SAL-VET sooner, as I feel that we could have saved the whole bunch."
LeRoy A. Barrett, Oswego, Ills.

"When the SAL-VET arrived my hogs were sick, and up to that time, I had lost sixteen pigs, all under twenty pounds. After the balance of the pigs had access to SAL-VET, they came through all right, and some of them now weigh 525 pounds, which I consider pretty good. I am talking SAL-VET to every man I meet, as I honestly believe it is the one conditioner and preventitive to feed to hogs the year 'round." Ben E. Woitte,
Prop. North Grove Farm,
Rt. No. 1, Milbank, S. D.

"When we butchered our hogs, we found them entirely free from worms, although before we began feeding SAL-VET, one hog in particular seemed badly out of condition and was coarse and rough. When we butchered him, he was the smoothest and fattest hog in the bunch."
F. H. Durflinger,
Rt. No. 8, Van Wert, Ohio.

Look For This Label

on all SAL-VET packages. Don't be deceived by imitations.

Don't buy "Sal" this or "Sal" that; get the original genuine SAL-VET.

PRICES 40 lbs., $2.25; 100 lbs., $5; 200 lbs., $9; 300 lbs., $13; 500 lbs., $21.12. No orders filled for less than 40 lbs. on this 60 day trial offer. Never sold in bulk; only in Trade-Marked Sal-Vet packages. Shipments for 60 days' trial are based on 1 lb. of Sal-Vet for each sheep or hog, and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular sized packages.

Don't Send a Cent—Just the Coupon

Tell me how many head of stock you have and I'll ship you enough SAL-VET to feed them 60 days. You simply pay the freight on arrival—feed it as directed. At the end of two months report results. If SAL-VET has not done all I claim, I'll cancel the charge — you won't owe me a single penny. Send the coupon today and begin action against worm pests—the greatest enemy you have to contend with in raising stock.

BUFF WYANDOTTES WIN IN CALIFORNIA.

A Picture of the Winners.

The picture on this page shows the winning pen at the California egg-laying contest, which recently closed at Napa. This is a pen of Buff Wyandottes owned by W. H. Pearson. These six birds laid, during the year, 841 eggs, or 140 each, and they defeated 66 other pens, the nearest to them being six White Leghorns which laid 802. This California laying contest had several original features. Instead of starting as the others did in the Fall, so as to give breeders a chance to enter their Spring-hatched pullets, this contest opened in February, at a bad time for hens to start and make their best record. Instead of 10 hens to the pen, as is the case at Storrs, or five hens, as at Thorndale, Pa., each pen in this California contest had six hens, the owner having the privilege of keeping a rooster with them if he desired. The hens were all kept in one large building, with little or no exercise, being closely confined all through the year. The season in California was not favorable to egg production with hens kept under these conditions, and while this yield of 140 eggs this year does not compare favorably with the records made at Storrs, it does require good birds to give a fair record under the hard conditions of this California contest. During the earlier part of the contest the Leghorns ran rapidly to the front, and it was thought that they would make a runaway race of the trial, but later the Leghorns fell by the wayside, and the Buff Wyandottes steadily cut down their lead and finally passed them. In this contest a large proportion of the leaders were found in the American breed. Whether that shows that this larger type of hen is better suited to California conditions, or whether such birds are better adapted to close confinement, will be a matter for speculation. We think, however, it will be found that birds like the Wyandotte or Rhode Island Red are better adapted to a contest under these California conditions than are the lighter or more nervous birds like the Leghorn.

It is a question whether such a contest as this, with the birds closely confined and under conditions which would probably not be found in commercial egg production, really gives a fair test of the birds. However, there is no disputing the fact that Pearson's Wyandottes walked up to the front and stayed there. One report of this trial stated that these birds were trap-nested, but Mr. Pearson says this is a mistake, for they were not trap-nested at all. Pearson also claims that these birds are high scorers in the show ring, and that these trials demonstrate that fancy poultry, or what we would call blue ribbon stock, can also excel at egg production. These birds, however, will have to lay more than 140 eggs apiece in order to hold their own with some of the utility birds which are usually found at our Eastern contests.

These Wyandottes come from the stock of Dr. N. W. Sanborn. He has two pens of high score birds in Storrs contest. Dr. Sanborn's birds are making a very good record. Although not up at the top notch, they are, however, blue ribbon birds, and their record also goes to show that a hen may excel in the show ring and still lay a large number of eggs during the year. We think the California contest managers made a mistake in starting their contest so early in the year. It would be far better to wait until late in the Fall, as that would give breeders an opportunity to develop their Spring-hatched pullets so that they would start laying early in the contest. It is one of the most hopeful indications for the future of the poultry industry, that these contests are creating so much interest throughout the country. The poultry business has in the past lost something of the stimulating effect of the dairy cow contests which have done so much in the past to improve the dairy cow and give her a personal reputation. We believe that after a few more years of these contests, breeders will be able to develop breeds and "strains" of laying hens and place the business of handling pedigree birds upon a sure and strong foundation. There can be no question about the possibility of improved poultry culture in the future. For instance, the world's meat supplies are rapidly running short, and there is no way for men to turn under our present conditions in order greatly to increase the supplies of beef and pork. Improved marketing and selling conditions here in the East would have the effect of increasing the beef supply somewhat, but the cattle buyers and slaughterers now have such a monopoly in the matter that it is very difficult to improve conditions so long as they control. The people will have meat of some sort, and as prices of beef, mutton and pork go up, the hen man finds his opportunity for an increased supply of poultry and eggs. There seems to be no question about this, and therefore, the business should be thoroughly organized and complete investigations made regarding the best forms of the different breeds and the best ways of producing both eggs and chickens. Poultry contests are aiding this better than any other plan which has yet been devised, and it should be encouraged in every way and carried through.

A PEN OF BUFF WYANDOTTES—CHAMPIONS IN THE CALIFORNIA EGG-LAYING CONTEST. Fig. 223.

As further information about the breeding of these prize winning birds we print the following note from Dr. Sanborn:

"Pearson's pen was made up of six females that were two years old when the contest ended on February 20. These six layers were all sired by a cock that he hatched from eggs I shipped him

across the continent. These eggs were from my best show mating—headed by a cock that had won first at Madison Square Garden, and made up of nine females that had won ribbons at Boston, Washington or the Garden shows. So much for the sire of his pen that won first. On the female side of Pearson's pen that produced these six layers there was some blood not directly from my farm. On that side there was about one-fourth blood that was a constant winner at our State Fair. It was from a line of winning stock."

A BUNCH OF FACT AND OPINION.

The $1.50 Dollar.

We are greatly indebted to the services of your company in its endeavor to secure fair treatment for the public, and especially for your subscribers, from common carriers and other organizations, and it is for this reason that I call your attention to the situation outlined in this letter. There is, about seven miles from the center of Williamstown, a lime company which offers agricultural lime in hundred pound bags at $4 a ton. Mindful of the constant references in your excellent paper to the value of lime I wrote to railroads for rates from Zylonite Station in Adams, Mass., to Williamstown. I find that for the haul from Zylonite Station to North Adams the charge is made for lime in less than carload lots of five cents a hundred pounds. This is over the Pittsfield branch of the Boston and Albany Railroad, the westerly terminus of which is North Adams. The rates from North Adams to Williamstown, a distance of five miles, is five cents per hundred pounds. In other words, for hauling this product about seven miles the cost would be $2 a ton, or 50% of the value of the product. We hear a good deal about the desire of the poor abused railroad corporations to assist the rural communities. In fact we in Western Massachusetts the last few years have been told how eager a certain railroad corporation has been to open up the dark and benighted recesses of our hinterland to the civilizing influences of railroad and trolley facilities. This is a good example of the attitude of the railroad corporations toward the development of rural communities. While it is undoubtedly true that the attitude of the public in many instances has been unfair to corporations, it is still more true that this attitude has been caused by a long series of unreasonable and unfair acts of corporations toward the public. If there is any injustice toward public service corporations in the legislation of the present day, it is the logical result of the accumulated grievances of the public, to which through a long series of years the corporations turned a deaf ear in an insolent attitude of defiance. They sowed the wind and they are now reaping the whirlwind. SANBORN GROVE TENNY.

Massachusetts.

Rough Handling of Mail.

I was for nearly five years postmaster of the city of Fitchburg, Mass., so would be supposed to know a little about handling U. S. mails. Before parcel post existed the mails were handled in a very rough manner, which seemed wholly unnecessary; thrown loosely into bags and bags thrown with all the strength a clerk could muster, one clerk testing his strength with that of another, from one end of the long room to the other; slammed into a mail wagon and from wagon to car. The same treatment was given it from mail car to its office of destination. More than this, for much of it was repeated over and over before the addressee received his smashed up package. I have seen many baggage cars loaded with many kinds of freight, but not even cordwood and coal is handled so roughly or in such a don't-care kind of manner as the United States mails.

Is that method of handling necessary? If it continues, parcel post will soon become very unpopular. As parcels are now handled by the post the box or container must cost about as much as its average contents to prevent its being smashed en route. Why is the Postoffice Department so stupid in regard to this package handling? Why not require all who handle them to exercise the same care as do the express companies? Why not use hampers, pack them carefully with the packages, and insist that they be handled with the same care that crates of eggs are handled by express? I think if the Postoffice Department should push its parcel post improvements on that line it would prove much more popular than raising the weight allowed or reducing rates. THOS. H. MANN, M. D.

The Hired Man and Contracts.

A Canadian farmer brought suit against his hired man, for violating a contract or agreement of work for a certain term of months. In this case the hired man was engaged to work through the season. When the hardest work of the year came, this hired man simply left, claiming his wages up to date. If the farmer had discharged the hired man when work became slack, or through some incident which spoiled his season's plans, the hired man could have compelled the farmer to keep his contract, and either give him work or wages for the full term. This Canadian farmer appeared to think that it is a poor rule which will not work both ways, so he brought suit against the hired man. The courts have decided that a farm hand who makes a yearly contract with his employer, and who violates this agreement, is not entitled to his wages, but is liable for damages, sustained to the crops of the farmer,

ORCHARD INTER-CROPPED. Fig. 224.

because he left. Many a man will testify to the fact that his hired help have left him right in the crisis of his work, and sometimes the man goes because he can obtain better wages elsewhere, or he may have other reasons. Generally it has been supposed that there is no redress for this violation of contract, although if the farmer discharged the man he is always liable for the contract wages and damages as well. This Canadian decision puts the relations between farmer and hired man in a new light. They are under such a decision, on terms of equality in the law, so that a breach of contract is the same for one as for the other. It is not likely that a farmer could ever obtain damages from the ordinary hired man, but it is no more than fair that the two parties to a contract should have not only the same privileges, but equal responsibilities for violating their agreement.

Railroads and Apple Shipments.

Here is a case which will interest our fruit shippers. A fruit grower in an Eastern State received an order from a produce company for 20 barrels of apples, 10 of one well-known sort, and 10 of another. The buyer agreed to pay $2.50 a barrel f. o. b. at the grower's station. When the order came, the grower did not have a full 10 barrels of one sort. He therefore sent 12 barrels of the second variety or-

ORCHARD SHOWING COVER CROP. Fig. 225.

dered, seven of the other ordered variety, and three barrels of another well-known kind, all No. 1 fruit, properly packed. The shipment was made by order with bill-of-lading, with sight draft attached. After the apples arrived this produce company wrote that they had examined the shipment, and made complaint both as to kind and quality, but they demanded a rebate of 30 cents per barrel. The bill-of-lading expressly prohibited any inspection, yet the railroad company disregarded this instruction and permitted the buyer to look the apples over. For that reason the grower declined to give any rebate. He held that the railroad had violated its contract by permitting inspection. Therefore he declined to instruct the railroad as to distribution of goods. The apples were refused by the produce company after the shipper declined to give the rebate of 30 cents per barrel and the railroad refused to pay the price for which apples had been sold. The grower then got a judgment in the magistrate's court against the original railroad which started the freight. This case was appealed to the circuit court, and was tried, the jury giving a verdict to the grower for the full amount. The grower proved that the apples were No. 1 fruit. He also proved that the produce company was permitted to inspect the apples, yet the judge set aside the verdict, the railroad company offering $18 less than the amount sued for, on the ground that this figure was what the apples brought at their sale. The case will be tried again, but this statement will interest many of our readers who are shipping fruit with a bill-of-lading, like the one here mentioned, which prohibits inspection, but which prohibition is violated by the railroad. Not only in this case, but this grower states that the same thing has occurred with other apples shipped by him.

INTER-CROP AND COVER CROP.

A great many persons realize that to inter-crop a young orchard may give immediate returns, but they fail to realize that immediate returns also decreases the future returns unless you use judgment, and give enough fertilizer in some form to grow the inter-crop, and also furnish something for the growing orchard. By a system of inter-cropping with crops that are quick maturing and early, and later when the crop is harvested sowing a cover crop to turn under, the fertility of the orchard soil can ordinarily be kept in the best of condition. The picture of the three-year-old peach orchard, Fig. 224, was treated in this manner.

The first year the ground was plowed in the Spring, thoroughly disked and harrowed, marked both ways with a three-row sled marker as for corn, and the whips set in every fifth row, making the trees 17½ feet apart. Then we drilled garden peas between the trees. All were thoroughly cultivated. The peas were all harvested by the middle of July, at which time it was disked thoroughly, then sown broadcast with a combination of Crimson clover, Strasburg radishes, Cow-horn turnips and any left-over seeds of buckwheat or most anything that would help to cover the ground. The picture was taken last June about the time peas began to ripen. This crop of peas yielded at the rate of $18 per acre, while the peaches yielded a total of $31 per acre, this being their first crop.

Fig. 225 was taken in the apple orchard the last of August. Notice the density of the cover crop, six weeks' growth of oats and peas. This is no remarkable yield, but the inter-crop, we believe, more than pays for the cultivation and seed, while our orchard is in the best condition. Our orchard receives the dormant spray of lime and sulphur, also the apples are sprayed just after the petals fall with arsenate of lead, added to the lime-sulphur.

Indiana. E. H. BECK.

DOES SPRAYING POISON BIRDS?

I enclose a clipping from the Fitchburg *Sentinel*, which I think may prove of interest to you, and also to your readers. Spraying is done here in our town, and so far as I know there have been no deaths of birds or animals from the arseuate of lead used. I have fed hay to my horses which was cut under trees that had been sprayed, and have seen no ill effects. C. E. W.

Massachusetts.

The clipping referred to is from *Park's Magazine* —a letter from Niagara County, N. Y. The writer states that the slaughter of birds after spraying is "something awful."

Oh! if you could see the dead birds lying about after an orchard has been sprayed you would condemn more than cats. I have had two valuable cats killed by eating birds which had eaten poisoned insects, and the cats caught them as they were dying. The birds eat the insects that are covered with the poison, and they also drink the poisoned water from the leaves, and no bird escapes. They die by hundreds, and their little ones are left in the nest to starve or are poisoned likewise.

We have seen nothing of this bird slaughter in our own orchards, but this is worth considering. We have many readers in Western New York where the author of this article lives. Will they give us their experience? What are the facts about birds and spraying?

Dogs! A woman came home from Europe carrying what seemed at first sight a bull terrier dog. It turned out to be a dead dog, or rather its skin, turned into a "vanity box" in which this woman carried her perfumes, powders and handkerchief. This seems to be the latest use for Jack or Fido.

PRUNING GRAPEVINES.

I would like a little instruction on how to trim my grapevines, some two years old, some 15 years old, one 40 years old. E. D. S.
Savannah, N. Y.

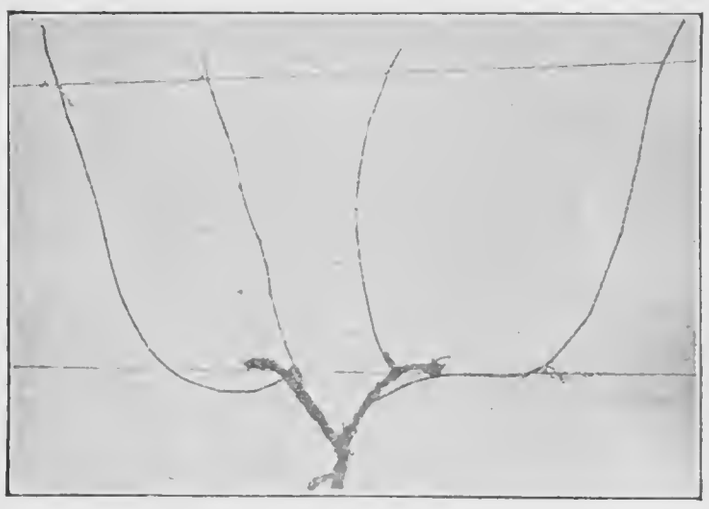
Since some of the vines concerned with this inquiry are 40 years old it is presumed that some sort of a trellis is employed. Not knowing the system of training that has been used in the past, it is impossible to give specified directions, but only general principles can be laid down.

First, a certain amount of old wood as a framework to support the fruiting wood must be carried; i. e., the stem, and in some systems, arms. It is almost needless to say that the stem should be straight and not crooked and gnarled. If such be present they should be renewed from the ground by utilizing suckers for the purpose. The arms should be kept shortened in and renewed at frequent intervals as they become guarled or diseased. From the stem in some systems or from short spurs on them the fruiting wood is obtained. This wood may be in one instance short spurs and in another canes carrying from six to 10 buds. When vines are pruned to spurs the major part of the tying is delayed till the fruit-bearing shoots are long enough to reach to the second wire of the trellis. This is also the case when the high-renewal system is employed. Here the fruiting wood is canes however, but they being tied horizontally along low wires the shoots require a Summer tying to the upper wires. When the other cane-renewal systems as the Chautauqua, the single stem, the double stem or the umbrella Kniffen, the canes are tied vertically, obliquely, horizontally or curved as the ribs of an umbrella. These canes arise from spurs left for the purpose, or from dormant buds on the old arms and stem. Well-ripened and properly located canes are selected, that is those that can most readily be adpusted to the wires. Oftentimes not much choice is left to the vineyardist and ill placed and immature canes must be used.

The accompanying pictures illustrate vines pruned and tied, the one according to the Chautanqua system, the other the high-renewal. In the first named no Summer tying is necessary, in the latter the shoots must be Summer tied, rye straw or raffia usually being utilized. In the Chautauqua system a stem and two arms are more or less permanent, although the arms are or should be renewed at frequent intervals. In the high-renewal practically all the wood older than two years is the short stem, reaching to the level of the lower wire, and a few short spurs from it, to furnish the fruiting wood for the following year. In both cases the trellis may be made with three wires, the lower being 18 or 20 inches from the ground and the others about the same distance apart. In pruning the fact that the best and greatest amount of fruit is borne on wood of one year's growth should ever be uppermost in the pruner's mind. F. E. GLADWIN.

"AN EASY GRAFT."

Every orchard grower in Missouri is familiar with the saw graft or, as it is often called, the Coburn method of grafting. Curiously enough, however, this method is practically unknown in most other parts of the country, notwithstanding that it is far easier than the common cleft graft and usually just as successful. Prof. W. W. Chenoweth of the Massachusetts Agricultural College is now introducing this graft to the farmers of the East, and probably it will be largely experimented with this season.



VINE PRUNED BY CHAUTAUQUA SYSTEM. FIG. 226.

Instead of using a grafting hook, a sharp even-toothed saw with a fairly good set is called into play. The branch to be grafted upon is sawed off in the usual manner, and it is preferable that the branch should not be more than 1½ or two inches in diameter. Then a cut is made with the saw, running from the top of the stub down the side a distance of two or three inches. The depth of the cut at the top should be about one-half inch and of course it will diminish as it extends down the stub.

The scion should be similar to that cut for a cleft-graft, but must be shaped a little differently. Both sides of the lower end are trimmed a distance of from 1½ to two inches, so as to secure a wedge, and one side should be thicker than the other. The best way of explaining the way to trim the scion is

MAKING CUT FOR GRAFT. FIG. 227.

to say that it must fit snugly into the saw cut, with the bark of the scion meeting that of the stub on each side. When fitted into place, the scion will be firmly anchored, if properly made. The next and final step is to apply grafting wax all around the scion, making certain that every part of the saw cut is covered. Commonly only one scion is inserted, for an expert in the use of the Coburn method expects pretty nearly every scion to grow. There is no reason, however, why two scions should not be grafted on a single stub. In fact, if it is found advisable to graft a large branch, it may be well to use three scions.

There are several advantages claimed for the Coburn method, but the one which appeals most

SCION INSERTED BUT NOT WAXED. FIG. 228.

strongly to the man who has a large orchard is the fact that the work can be done with extreme rapidity and yet with a certainty of success quite equal to that which may be expected when the slower cleft graft is employed. Then, the stub is not split down and less wax is required to protect the scion. This plan of grafting may be used on any fruit tree which is in condition for grafting. Many times failures to succeed when grafting cherry trees are due to the fact that the work is left until the dormant season is over, as is the practice when grafting apple trees. Success is much more certain if cherry trees are grafted in February or early March. E. J. FARRINGTON.
Massachusetts.

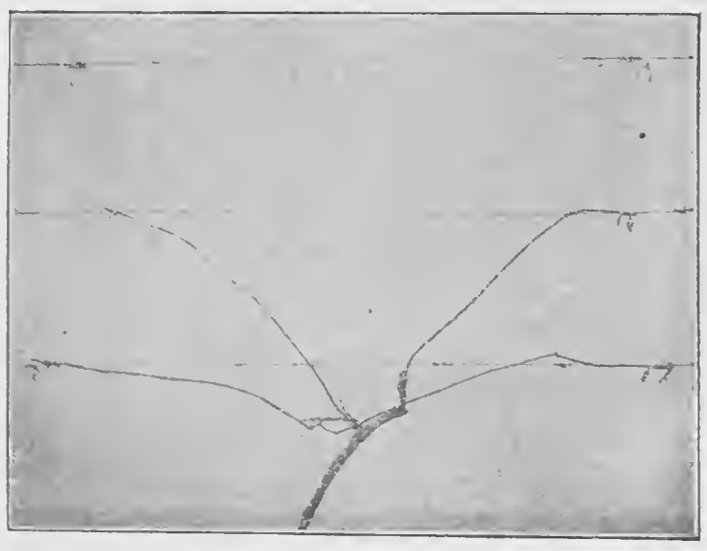
THE CHICKEN THIEF PROPOSITION.

On page 394 I read the article, "Chicken Thieves and Rural Police," by Leo A. Mapes. I will tell Mr. Mapes how we do business in Buckeyedom. About 35 years ago, in Northern Ohio, we were annoyed considerably by the loss of valuable horses, besides much petty theft. The farmers in this locality lost, in three months, 10 horses which had been stolen. Forbearance had ceased to be a virtue, and about 70 of them organized themselves into a vigilance committee, obtained a charter from the State, and later on many others did likewise, and formulated a State organization, again obtaining a State organization charter. This grants to every member of the several local organizations a pursuer's certificate and full power to make arrests without a warrant if necessary, the same as a deputized State marshal. In this section of Northern Ohio we have lost but two horses that we have not returned to the owners, and have sent several horse thieves to the penitentiary, some of them serving time now, besides chicken thieves, smokehouse looters, and many other misdemeanors until we have practically eliminated such lawless gentry. The expense of such organizations is nominal. We charge here one dollar a year for protection and can safely say that we have plenty of money in the treasury to follow a horse thief across the continent, and unless some fellow goes wrong we are thinking of importing a good live horse or chicken thief for the boys to work on, for fear they will lose interest with the dry rot. If we could get some of the good law-abiding citizens of New York to formulate such organizations (Pennsylvania and Ohio already have the Rural Police), we could call a convention and formulate a Tri-States organization whereby we could take down the State fence lines and make arrests wherever the culprit is found. W. C. WILLIAMS.
Huron Co., Ohio.

ACID PHOSPHATE IN MANURE.

I have been reading THE R. N.-Y. for March 7, and must say I think it one of the best numbers I have seen of the best agricultural paper I know. On page 378 H. H. asks about mixing hen manure with fertilizers. Your advice as to handling the droppings may be all right, but I think the desired end—the preservation from waste by heating, and having the material in suitable condition for use—may be attained with less trouble and expense. I have for several years past used acid phosphate for preserving the droppings from fermentation and waste. I scatter it on the droppings board freely, and if it is not convenient or weather does not permit cleaning the boards before the accumulation becomes objectionable, I scatter more acid phosphate over the material as it lies. The acid phosphate has the power almost entirely to prevent disagreeable odors, and keep the house sweet and fresh smelling. When I gather the droppings I put them in a pile in a protected place and mix with them more acid phosphate. Kept in this way, the droppings do not dry into hard lumps that require pulverizing, and are preserved entirely from waste. Also the acid phosphate is needed to help make the droppings a more well-balanced fertilizer. Some potash will need to be added when the manure is used at planting time. The potash might be used on the droppings board and in the pile, and it would assist in preserving the manure, but I should be afraid to use it on the boards, as I think the hens might eat the crystals, which would poison them.

While I am speaking about the use of acid phosphate, I will mention another place where I found its use very desirable last year. I used it in the horse stable, sprinkling it over the wet stable floor. Its use entirely prevented all unpleasant odors, and also kept the manure from heating and burning. Also it very largely—almost entirely—kept flies from breeding in the manure. I cannot say what proportional quantity of the acid phosphate is needed to produce the results I have secured, but I used it quite freely, as I considered its use cost nothing except the labor of using, as its fertilizing value fully offsets its cost. As warmer weather and fly time is coming soon, I think the knowledge that horse manure can be preserved from heating and flies prevented from breeding in it may be of



HIGH RENEWAL SYSTEM. FIG. 229.

value to many persons; and these ends may be attained entirely free of cost. MONROE MORSE.
Massachusetts.

R. N.-Y.—We have often advised the use of this phosphate in horse manure as a fly repellent. As to hen manure, one or two cases have been reported where too much acid phosphate was used and the hens' feet were injured.

SOUTH JERSEY NOTES.

Nitrate of Soda for Tomatoes.

How should I use nitrate of soda with my tomato plants, both in cold frame and field? H. P. R.

Burlington, N. J.

We do not use nitrate of soda in the cold frames for any of our plants. A few years ago we had several sashes of egg-plants that were starting very slowly, and to get them going we decided to use a light dressing of nitrate of soda. If I remember right we used it on all but one or two sashes. The application was very light and made in the middles of the rows, which were five inches apart. A neighbor present at the time remarked that an application as light as that could do little hurt even if it did no good. But it did hurt them, and with the exception of the one or two sash the entire bed was practically ruined. I know of others who have had very disastrous results from using both nitrate of soda and ready-mixed fertilizers in the cold-frame beds. An early start with tomato plants means much, and every grower wants to give the best treatment, but in view of the uncertain results from the use of nitrate of soda I would rather advise anyone to use good homemade stable manure or hog manure, or a mixture of the two, in the beds for his main crop of plants, and use nitrate only on a few as an experiment. In passing I may say that while New York manure gives good results in the field it has a tendency to burn plants when used in cold frames. In the open field nitrate of soda is all right and if used early in the season, in moderate amounts, it will increase the yield and not at the expense of earliness. One hundred and fifty pounds per acre is a fair application. Three hundred pounds is quite heavy. Some growers use ready-mixed fertilizer in the hill and then as soon as the tomatoes start give one or two top-dressings of nitrate of soda, putting on from 100 to 150 pounds per acre at each application.

Strawberry Growing.

1. I have half an acre of strawberries; this is the second year. They gave me a big crop last year. They have had 800 pounds fertilizer, vegetable brand, put on them in three applications since Spring, 1912, when planted; 100 pounds bone meal. Hot dry weather set in before crop was gathered, cooked berries and plants both, but I mowed them down and weeded and tilled until freezing weather. They came out and grew big and healthy, but made no new plants. I did not top-dress them, as I am in South Jersey and get fair results without. What kind and how much fertilizer and how late will answer? Are they worth it? 2. I have two horses, will have but one this Summer, two hogs. I wish to put acre in some forage to cut and feed them. What should it be? I have ground near oak and maple swamp which grew large cabbage last year. How about that for forage, also for new strawberry bed? Old blackish soil near swamp was farmed first time in 15 years last year, but grew fine cabbage and turnips.

Manahawkin, N. J. J. C.

1. On the sandier types of soil, here in South Jersey, we find it is not necessary to mulch strawberries; but on heavy soils it pays to do so because freezing and thawing of the soil in late Fall and early Spring will throw out the plants. Our main crop strawberry has been the Gandy. They are grown in matted rows and we find that it pays well to use fertilizer on them the second year and also the third year provided the bed consists mainly of berries and not natural grasses and clovers as is so often the case the second or third season. Fertilizer should be applied just about the time growth starts in the Spring, and this year we are planning to use a 3.7-8-8 mixture, most of the nitrogen in which is quickly available, at the rate of 400 to 500 pounds per acre. It is put on with a drill that scatters it evenly over the row. I have seen fertilizer put on after blossoms appeared with the result that many of them were killed from contact with the fertilizer. 2. Forage crops are out of my line but I can think of nothing better than Canada field peas and oats seeded at the rate of one and one-half bushels of peas and one and one-half bushels of oats. That black soil near the swamp would seem to be ideal for both forage crops and berries. However, it would pay us better to plant that in berries and truck and depend on sweet corn stalks, cull tomatoes, sweet potatoes, etc., to furnish roughage for the horse and pigs.

Mussels for Lime.

We have been experimenting a little on our 200-acre farm with Alfalfa, and it seems to flourish all right. We would like to go into it more extensively, but the cost of lime added to the other expenses of starting make it rather expensive. We live near the "mussel beds" and would like to know something of the analysis of it and whether it would be right for clover or not. A. R.

I have no personal knowledge of the use of mussels as a source of lime, however I quote the following from the late Dr. E. B. Voorhees: In certain sections of the coast States farmers have access to an almost unlimited supply of mussels, which may be had for the carting. Analyses made at the New Jersey Experiment Station show them to contain, in their natural state, a very considerable amount of fertilizing constituents, the nitrogen reaching .90 per cent., the phosphoric acid and potash .12 and .13 per cent., respectively, and the lime 15.84 per cent. The organic portions of the mussels decay rapidly, and serve as a fairly good source of nitrogen; and since this product is twice as rich in this constituent as average yard manure, it is well worth the expense of hauling.

Lime on Sweet Potatoes.

Is it advisable to use lime on Lima beans and sweet potatoes and what lime do you think is the best for ground in Gloucester Co., N. J.? C. H.

We have used lime for Lima beans and sweet potatoes with good results. Both ground limestone and lump lime have been tried. There seems to be little difference in the results from either. On sandy soils we try to get on about one-half ton of lump lime and one ton of ground limestone per acre.

TRUCKER, JR.

Spring Rye and Vetch.

I seeded down about three acres to oats last Spring, and the dry weather killed out the grass. Can I put Spring rye and vetch on the lot for hay, and how much per acre to reseed? T. H.

Cambridge, N. Y.

You can sow Spring rye and vetch, but it will not give you as much or as good fodder as Canada peas and oats—which we have often advised.

THE AMERICAN PEACH ORCHARD, by Prof. Waugh. We have long needed a definite specialized book on peach culture, and Prof. Waugh's new work is very welcome. The chapters on climatology, soils and exposures, and on choice of varieties, will be found extremely helpful. Planting, care and marketing are treated from the selection of the trees to the final package, while the ultimate consumer is treated to a number of tested recipes. The catalogue of varieties is a welcome feature. Published by the Orange Judd Company, New York; 238 pages; illustrated; price $1.00.

Plant Apple Trees That Bring Profits

Apple trees, like people, are happiest when in the right location. Most kinds grow well in New York and New England, but tests show that

Baldwin, McIntosh, Spy, Stayman, R. I. Greening, Yellow Transparent, Gano,

are money makers in that territory. Plant the kinds that pay best.

Harrisons' Trees are budded from bearing orchards. They are true to variety.

We sell only trees we grow. Every tree we ship is clean, straight, healthy.

Get our 1914 Catalogue. All about trees for all sections. Fruit, ornamentals, shrubs, roses.

Harrisons' Nurseries, Box 494, Berlin, Md.

FRUIT TREES

You can buy your trees from us with the confidence that they will be sturdy stock, full of vigor and true to name. This confidence comes from the knowledge that we have faithfully served New England fruit growers for 31 years.

In our extensive nurseries all the conditions of soil, climate and expert care combine to produce disease-free fruit trees and plants that thrive and bear profitable crops.

Free Catalog is unusually complete, practical and filled with helpful information for fruit growers. Write today.

MALONEY TREES

15 TREES AND PLANTS 98¢ WORTH $1.65

1 Elberta peach; 1 Harvest, 1 Baldwin apple; 1 Bartlett pear; 1 Montmorency, 1 Oxheart cherry; 1 Orange quince; 1 Maloney prune. All 3½-4½ ft. Grapes; 1 Concord blue, 1 Delaware red. Currants: 1 Perfection, 1 White Grape. 3 Pleplant roots. Value $1.65 for 98c. Send today for free, 1914, wholesale, illustrated catalog of Fresh Dug, Guaranteed True to Name and Free from Disease Trees. Maloney Bros. & Wells Co., Box 89, Dansville, N.Y.

Peach Trees

Our own selection from list advertised last week will consist of at least three kinds and you have the privilege of barring one of these kinds as unsuitable for your locality. We offer our selection as follows:—

3½ to 5 ft. @ $8.00 per 100
3 to 4 ft. @ 6.00 per 100; 40.00 per 1,000
2 to 3 ft. @ 5.00 per 100; 30.00 per 1,000
1½ to 2½ ft. @ 3.00 per 100; 20.00 per 1,000

PLUM TREES

Burbank and Abundance, 2 year, extra fine. $2,00 per 10, and $15 per 100.

NORWAY SPRUCE

12 to 18 inches, extra fine at $6.00 per 100.

A full line of Ornamentals.

Farm Engineering.

Waterproofing Paper.

Can you tell me what cheap material I can use to waterproof paper? I can get almost any quantity of large heavy paper boxes, and could use them to line poultry houses, if they could be made waterproof without too much expense.
Palmyra, N. Y. W. L. P.

Paper may be readily waterproofed in a great many ways. Probably the cheapest method for use with your paper boxes is to coat them by means of a brush with hot coal tar, thus making a sort of roofing paper. Another mixture may be made for coating the paper, of half a pound of soap dissolved in a large teacupful of water mixed with half an ounce of gum arabic and one and one-half ounce of glue which have been dissolved together in another cupful of water. You will want more of the mixture than this will make, of course, but keep these proportions. Soak the paper in the solution and hang it up or lay it out to dry. If possible, roll the superfluous liquid out of it before spreading it out to dry. Try each of these methods on a box and see which is most successful. You can also compare the price of the treatment in your locality. In most places the coal tar would cost less and I should suppose that you could obtain it readily.
R. P. C.

Laying Wood Block Paving.

In laying wood block paving, which would be the best method to withstand heat, such as boiling water continuously poured on it, or where the sun shines all day long, cement or pitch for filling?
Rhode Island. J. M.

Not having had sufficient experience to be sure of the best method under the circumstances you describe, your question had to be referred to a number of experts who have had long experience with wood block paving, and strangely enough, they all recommend the pitch filling. Cement filling is used to some extent but, so far as I can learn in only an experimental way. Brick and asphalt blocks are commonly imbedded in concrete. On reading your questions several times, it has occurred to me that you may be asking two entirely separate things. In the first place, wood pavement, properly placed end grain up is very satisfactory. It depends somewhat on the character of the traffic, but it has been used on the main streets of many Massachusetts towns and cities for years. As to a surface coating for a roof or a floor or something of that kind, exposed to boiling water or a hot sun, concrete would be better than pitch alone. Cement would, of course, be as good as or better than concrete in most places, although costing more than concrete. R. P. C.

Siphon Over Elevation.

Can we siphon water over a ridge 33 feet high, where we can have the outlet 50 to 75 feet lower than the spring?
Grandview, Wash. J. M. P.

You cannot with safety siphon over a ridge 33 feet higher than the spring, no matter where the outlet may be placed. The reason is that a siphon works on the principle of the suction pump. In place of a piston removing the air from the pump cylinder, thus forming a partial vacuum and allowing the atmospheric pressure to force the water up to fill the vacuum, the water in the long arm of the siphon rushes out because of its weight, and leaves a partial vacuum, which is filled by water forced up the pipe from the spring by the atmospheric pressure on the water at the spring. Atmospheric pressure will support a column of water about 34 feet high. If you could so arrange your siphon pipe as, for instance, by digging a ditch at the top of the ridge so that the water would be well within that distance above the spring, your siphon would work. Placing it on top of the ground without accurate measurement being made, when the ridge is so near the maximum height, would be almost certain to result in failure. It is only this one point in the pipe that must be carefully placed, provided the pipe is airtight and the outlet is appreciably below the level of the spring. R. P. C.

Fireproofing Wood.

I am building a house, and wish to fireproof some of the framing material joining the brick work that will probably get pretty hot from the furnace. Can you tell me what material I can use, and how to use it to make this woodwork incombustible? H. L. M.
Painesville, O.

Making wood fireproof by means of a coating only is, in fact, merely the application to the wood of some substance which is fireproof. For instance, you could tack up a sheet of asbestos, but you don't wish to do so. The logical substitute is to paint the wood with a liquid asbestos paint. Really this is the same thing, but a little neater job. Such a paint consists of powdered asbestos seven parts, sodium borate four parts, gum lac three parts, water 20 parts. Dissolve the borax and lac in the hot water and add the asbestos. Give the wood four or five coatings, letting each one dry before applying the next. If you wish to treat the wood before putting it in position, soak it in a solution of boric acid, one pound; ammonium phosphate 10 pounds and water five gallons. A satisfactory job should result from either of the above protections, but on the whole, I think the paint is to be recommended because it may be easily renewed when renewal is needed. R. P. C.

Some Farm Conveniences.

A barrel stood at some convenient place in the barn will make a mighty handy place to stack the forks, shovels, and hoes. Some farmers may have a "wardrobe" for these tools, but there are hundreds of barns in which the forks and other tools are stood against the wall or a post. The barrel provides a place to put the tools, and when such place is provided, use it. Misplaced tools require time to find, and on one farm I know fully five days' time for one man for the year is spent in searching for scattered hand tools. There may be some niche or corner about the barn which is convenient and adapted for the placing of tools; if not try the barrel. It will pay. It is a simple idea, but its use will save steps and dollars in the year.

If a tine breaks from a fork, don't throw it away, but put it in the mowing machine tool box. You will find it will be one of the handiest tools about the machine during the haying season. It will enable one to get at oil holes and clean them out. It is just as efficient around other machinery. The curve in the tine makes it possible to get around shafting which could not be reached were it straight, and its length makes it more serviceable than a nail or spike. Another stunt will be to remove the axles from the old buggies and use them for props for the doors about the barn, and for such purposes as an iron crowbar may be used. In doing so save the clips, place them in a box kept for bolts and burrs, for they will come handy about the farm. W. J.

HOUSEKEEPER: "What makes you so late with the milk these mornings?" Milkman: "Well, you see, mum, the pure food law don't allow us more than 25 million bacteria to the gallon, an' you wouldn't believe how long it takes to count the little beasts."—London Farm and Home.

TRY A BOHON "BLUE GRASS" BUGGY

30 DAYS WITH YOUR MONEY IN YOUR POCKET

I WANT you to try it on your own roads, no matter how rough they are, and if it is not satisfactory, if it does not come up to all my claims, send it back. You won't owe me a cent. If you've paid me anything I will pay it back, and I will pay the freight both ways besides. You know I could not make that kind of offer if my buggies were not RIGHT in every way. You know I wouldn't last a year in business, and the fact that I make this offer proves the QUALITY of my vehicle.

The next question is the PRICE—and the answer is easy. I sell only from my factory direct to you—cutting out all profits and expenses of jobbers, salesmen and dealers. I make the same small profit whether I sell to them or to you, but by selling to you instead of to them I save you $25 to $50. Let me send you my

Big Book of Buggy Bargains FREE

I am mighty proud of it—honestly believe it to be the finest buggy book ever issued by anybody. You will be glad to have it, and you will do me a favor if you will ask me for a copy, even if you do not expect to buy a buggy this year. It shows how "BLUE GRASS" buggies are built, with photographs and pictures of an endless variety of finished "jobs," some in actual colors. It gives you a bigger range for selection than you could find in a dozen dealers' stores. It explains the details of my free trial offer, my $30,000 guarantee bond, etc. Now don't put it off—you may forget. Send me a postal with your name and address right NOW, and the book will come to you in the first possible mail.

D. T. Bohon., 2411 Main St., Harrodsburg, Ky.

TILE DRAINED LAND IS MORE PRODUCTIVE Earliest and easiest worked. Carries off surplus water; admits air to the soil. Increases the value. Acres of swampy land reclaimed and made fertile. **Jackson's Round Drain Tile** meets every requirement. We also make Sewer Pipe, Red and Fire Brick, Chimney Tops, Encaustic Side Walk Tile, etc. Write for what you want and prices. JOHN H. JACKSON, 89 Third Ave., Albany, N Y.

ROUND TILE

Here is Super-Strength

Reo the Fifth

is designed by a man who believes in super-strength. He has learned this need through 27 years of car building.

In this 35-horsepower car, every driving part is made to meet the requirements of a 50-horsepower engine. And every test goes far beyond the usual requirements.

For Instance

For years we have kept test chassis on the road. Relays of drivers have run them at high speed night and day. After 10,000 miles of this reckless driving we take the car apart and inspect it.

Not only must the chassis stand that test, but every vital part must stay new. It must show but little evidence of wear.

We could build this car for one-fourth less by just skimping the hidden parts. Under normal conditions it might for a time serve you as well as this. But it could not stay new. And it might cost you hundreds of extra dollars in troubles, repairs and upkeep.

Does It Pay?

It pays us to give you the utmost in a car. We have in this way held the lead in our class. The demand for such cars has grown and grown, faster than we could supply it.

We are building for the future—for what men will say five years after buying the car.

It also pays owners to buy such a car, when they buy a car to keep.

Go and See

Go see this car. See the handsome streamline body, the perfect equipment, electric lights and starter, deep upholstering, perfect finish.

Then go below all that. Get the details of this costly chassis. Find out why each car is six weeks in the building.

Then note how low we have brought the price. Last year's price was $1,395, with electric starter and lights. This year it is $220 less. Most of that saving comes from the fact that all our special machinery for building this car has been charged against previous output.

We are giving you here the best we know, regardless of time and cost. The more you know about motor car troubles, the more such a car will appeal to you.

Ask us for address of nearest dealer. We have them in a thousand towns.

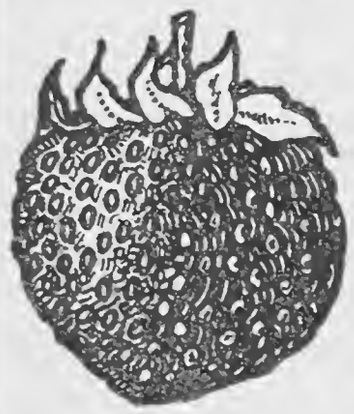
The Most Satisfactory Fruit Ever Grown Are the New Strains of

EVER-BEARING

Strawberries and Raspberries

that fruit same year as planted



I give my personal guarantee that these plants if set out in May will yield an abundance of large delicious berries next September and October and again in Spring same as common June berries.

I offer for the first time seed of my famous

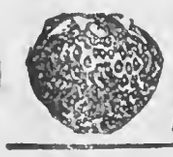
Longmeadow Cantaloupes

that I sell each season daily in barrel lots to the hotels Touraine, Parker-House, Youngs, Copley, Plaza and all other fine hotels and clubs in Boston and New York. These melons average netting me 30 cents each.

Don't buy berry-plants or melon seed until you write for my free catalog telling what kinds to grow and how to grow them.

C. S. KEMPTON, Longmeadow, Mass.

"There is no better authority in the East regarding melon-culture than Mr. Kempton."
Editorial New England Homestead



PLANTS. DIRECT FROM GROWER 75 varieties, Strawberries, Raspberries, Blackberries, etc. Honest goods. Prices reasonable. Write us. **A. G. BLOUNT, Box 122, Hastings, N. Y.**

STRAWBERRIES—Try the **Abington**, large early sort. 1000, not prepaid, $2.50. Many others at same price. Send for free catalogue. **SLAYMAKER & SON, Wyoming, Del.**

STRAWBERRY PLANTS—Guaranteed true-to-name. Best varieties at reasonable prices. Catalogue Free. **E. W. JOHNSON & BRO., Salisbury, Maryland**

Fall-Bearing or Everbearing Strawberry plants are my specialty. The new Progressive is the best berry I ever fruited. I sell it for **$2.00 per 100**, Americus, Superb, Productive and Iowa only **$1.75 per 100**. Drop me a postal to-day and I will send you free, my beautiful illustrated catalogue, which illustrates and describes all of these wonderful everbearing varieties. I guarantee every one of my plants to be pure and true-to-name. **Write to-day.**
S. A. VIRDIN, HARTLY, DELAWARE

Strawberry Plants—Leading Varieties. $2 and $2.50 for 1000. Apple trees, $8 to $15 for 100. California Privet, $12 for 1000. Stock guaranteed Catalog free. **G. E. Bunting & Sons, Selbyville, Del.**

Strawberry Plants—over Twenty Varieties at $2.50 per 1000. Descriptive Catalogue Free. **BASIL PERRY, Georgetown, Delaware** Headquarters for Fall-Bearing Strawberry Plants.

DIBBLE'S SEED CORN

Northern grown, full of vitality, from hand picked ears, shelled, screened and recleaned

Dibble's Mammoth Yellow Flint, early rank grower, enormously productive either 8 or 12-rowed. A hundred-day corn.

Dibble's Early Yellow Dent, largest extra early yellow dent for crop or silo, matures with us in 90-100 days.

Dibble's Improved Leaming, ten days earlier than standard Leaming of commerce with larger stalks and ears and *more* of them.

Dibble's Mammoth White Dent, grows under favorable conditions 15-20 ft. high and well eared.

Dibble's Seed Corn tests 90% or above. (Average tests to date over 95%) and we sell it to you on a ten days approval your-money-back-if-you-want-it plan. Price as low as $1.50 per bu. in quantities.

Dibble's Farm Seed Catalog and samples of Dibble's Seed Corn, *Free.*

REAL SEED CORN

VETCH AS A MANURIAL PLANT.

PART I.

SECURING HARDY TYPES.—During the last decade much discussion has arisen regarding the use of vetches as green manure and cover crops. For many years it has been known as an admirable forage crop in foreign countries, as well as in the United States, but not until recent years has its full value been realized. This has come about chiefly through discoveries and research in modern agricultural principles. In 1890, Winogradsky, a Russian scientist, isolated bacteria for the first time. His projects were at first confined to such crops as cow peas, Red clover and Alfalfa, but at the beginning of the present century important experiments were tried with the vetches. A little later, in 1904, A. D. Shamel, of the Bureau of Plant Industry, introduced into the tobacco regions of Connecticut some of the seed of European grown vetch. He sowed this seed on some of the bottom land soil in Connecticut Valley, and at first only a small proportion of the plants resulting survived the Winter. Then the seeds from the hardiest of those plants were sown the following year resulting in a larger and stronger growth. This was continued for two more years, and at the end of that time a hardy variety was secured that was adaptable to the climatic and soil conditions of Connecticut Valley.

VETCH AND TOBACCO.—The important part of this experiment was not alone the securing of a desirable variety of vetch, but the fact that it brought to light the advisability of using vetch as a green manuring and cover crop when the tobacco was off the fields. It was found that it accomplished this by means of nitrifying organisms that work upon the plant roots. The nitrogen resulting from this action had been taken from the air and added to the soil. This experiment has been of lasting importance, as now throughout the Connecticut Valley Hairy vetch plays a large part in the addition of nitrogen to the tobacco crop. Tobacco, depending upon the variety, requires from four to eight per cent. of nitrogen, and the farmers have found that in using the Hairy vetch as a leguminous cover crop they can save about half of their fertilizer bill. The writer last Summer visited a number of tobacco growers in the vicinity of Hartford and was very much interested to see the progress that had been made there in this way. On a large farm near Rainbow the only fertilizer used in addition to the growth of vetch was common New York City manure, and after the plants had been reset a small amount of nitrate of soda was added. At several other places the farmers bought only phosphates and potash, relying wholly upon the vetch to produce the nitrogen. Possibly it is not safe to do this entirely, but the amount of nitrogen that need be purchased can be cut down to a much smaller figure than without the use of vetch.

OTHER EXPERIMENTS.—Connecticut is not the only section of the United States where the value of vetch has been felt. Experiments similar in nature to those performed by Mr. A. D. Shamel have been conducted in practically every part of the country. The South now uses common or English vetch as a green cover crop for cotton in Alabama, Georgia and the adjacent States. In the West, common vetch is used as a Winter crop with oats and wheat for hay production. This is a common practice in late years in Oregon and Washington. Tests on the Umatilla Experiment Farm at Hermiston, Oregon, have shown the superiority of vetches as a Winter cover crop, and also that Alfalfa, when grown near young trees in an orchard, gave a depressing effect upon the less hardy trees, while the vetch had no unfavorable influence over them. It now plays an important part in the Citrus groves of California, being more extensively used than any other green manuring crop. In Michigan, Wisconsin, and Minnesota vetch has been found to be the best seed and forage crop for the sandy jack-pine cut-over lands.

Thus the vetches have come to play an important part in various localities, and there is perhaps no crop to-day more worthy of the farmer's attention. Especially here in the East is it coming to be the leguminous crop in rotation and in many instances taking the place of Red clover, cow peas and Alfalfa. The successful results in Connecticut could well be duplicated in New York State, and doubtless within a few years it will take its place in the crop rotations of many of the largest farms.

W. H. BULLOCK.

Fertilizing Asparagus.

I have an asparagus patch of 2½ acres that is just six years old this Spring. The crowns were one year old when planted in 1908, and in 1910 I cut and sold $308.41; 1911 (price was very low) $206.43; 1912, $245.42; 1913, $408.63. I am sure I lost at least $50 of "grass" by not having help at the proper time and could not get it. I only manured this patch once; that was the second year, and from that time on I have been using a special mixture that our agent puts up for asparagus, that costs $27 per ton. I use 1,500 pounds per acre of this in early Spring, at first working, drilled up the rows; at my last cutting in July I use 1,500 pounds, and keep cultivation up as long as I can, and in spite of all I can do in the Winter for the last two years the yard grass will grow. Do you know of anything that could be done to get rid of it? It is an awful bother in the Spring.

C. J. R.

The natural habitat of asparagus being the sea coast, common salt applied at the rate of 800 to 1,000 pounds to the acre will not only prove more or less beneficial to the plants, but will destroy practically all weeds and grass that may infest the plantation. Crab or yard grass, like asparagus, prefers a sandy loam to a clay loam soil, and will thrive with more persistency in the rich light soils such as are generally used for asparagus than on any other kind of soil. In some sections of the country where the soils are light and where there is much high wind during the Winter, crab grass is really of great benefit in preventing the soil being blown away and is welcomed as a valuable protection against soil loss, which in certain sections where the winds are unbroken by woodland or hills would be very heavy if it was not protected by the covering of dead crab grass. The yield of your plantation seems to be nearly up to the average, but would no doubt greatly benefit by a good application of composted stable manure to which should be added about 35 pounds of muriate of potash and 100 pounds of fine ground natural phosphate rock to each ton of manure, about 15 tons of this manure and chemical mixture to the acre will be sufficient. Apply immediately at the close of the cutting season.

A very successful grower in Virginia, writing upon the subject of manuring asparagus beds, states that he had made a practice of applying 25 tons of well-rotted manure to the acre, broadcast and worked in with the cutaway harrow every third year, also using at the same time 500 to 1,000 pounds of finely ground raw bone, and every third year 500 pounds of kainit should be broadcast to the acre. There are many ideas as to what kinds of fertilizers are best for asparagus, how much should be used to the acre and when it should be applied. The most reasonable and common-sense method seems to be that advocated by the author of "Asparagus Culture," issued as a farmers' bulletin by the U. S. Department of Agriculture, in which he says: "Those growers who apply a liberal dressing of stable manure or fertilizer immediately after the cutting season, supply the required nourishment to the plants at the time they most need it, and can most profitably utilize it in the production of spears. Manure thus applied will also act as a mulch preventing the growth of weeds, keeping the soil light and cool, and preserving the moisture intact. The manure should not be applied directly on top of the row." As between manuring in the row and between the rows, the latter should be selected as the evidently advisable one by which the feeding roots of the plants are most easily reached.

K.

"SOME of your constituents are disagreeing with you," said the trusted lieutenant. "Well, keep tab on them," replied Senator Sorghum; "when enough disagree with me to constitute a reliable majority, I'm going to turn around and agree with them."—Washington Star.

Studebaker SIX

$1575

ELECTRICALLY
• STARTED •
ELECTRICALLY
• LIGHTED •
SEVEN PASSENGER
FULL-FLOATING REAR AXLE

Hunt Among the Highest Prices For a Car Worthy of Comparison With This

Don't be afraid to aim at a much higher price in seeking the equal of this Studebaker SIX.

Judge it by cars costing from several hundred to a thousand dollars more. Follow the comparison—point by point.

Start with the seating capacity. The Studebaker SIX carries seven. Not six, but seven—in comfort, without crowding.

Its measurements, front and rear are identical with cars costing much more.

And it carries its seven passengers more economically—because it carries them without the wasteful bulk of heavier cars.

Without reducing the space, it cuts the weight tremendously—by scientific design and a proportion of lighter but strong steel forgings and stampings, found in no other car at any price.

Money Can't Buy a Better Axle

Look next at the full floating rear axle. No car at any price can improve upon it.

It's not a semi-floating; or a three-quarter floating; but a full floating rear axle.

This axle constitutes a 30,000 pound-inch factor of safety—you couldn't better it if you paid $5,000.

Full Supply of Timken Bearings

The Studebaker SIX has a full equipment of Timken bearings—not a partial equipment—but a full equipment.

So you couldn't do better in the matter of bearings if you paid $2,500—or more. (We are the largest buyers of Timken bearings in the world, by the way.)

Now, study the system of starting and lighting—the Studebaker-Wagner.

Unsurpassed Starting and Lighting

There isn't any better system than the Studebaker-Wagner separate unit.

You couldn't buy a better if you paid $5,000—it simply isn't made.

A Strictly Manufactured "Six"

Consider now, the way in which the car is built—the proportion of manufactured and assembled parts.

No car in the world—at any price—is more thoroughly manufactured than the Studebaker SIX.

Studebaker does not make the tires or the wheels.

But we do make all our own castings, stampings and forgings—all our own springs, and bodies, and upholstery — our own crown fenders, and cowls, and even our tops.

A Motor Beyond Compare

You know something about Studebaker motors. We've built more than 120,000 of them.

This SIX motor was built and rebuilt, tested and re-tested, for three long years, before it was offered to the world.

The experiment was all over and out of it before many another "Six" was even conceived in the draughting room.

Go right on up to the costliest cars—you won't find a sweeter or a smoother or a quicker or a more flexible motor than this.

Hunt, Hunt—We're Glad to Have You

So, we repeat—start high above the Studebaker price in seeking another car worthy of comparison.

We not only welcome comparison—we urge it.

In bigness, in beauty, in power, in silence, in seating capacity, in manufactured strength, it convinces every man who examines it that he need not pay more than $1575.

Send for the Studebaker Proof Book. It tells how we manufacture Studebaker cars in the Studebaker factories.

STUDEBAKER
105 Piquette Ave., Detroit

Send For This Folder

This is an extract from a folder just issued which you should read. It tells of the tremendous life-saving importance of the Studebaker Full Floating Rear Axle.

"If the shaft breaks will the wheels fall off?

"That is the acid test.

"In the floating axle the rear wheels are independent of the shafts for their connection with the car. Full floating axles do not break. Broken axle shafts occur only in non-floating types of construction in which, when a shaft breaks, a wheel loses its moorings.

"In the primitive, semi-floating type the axle shafts are asked for a wide range of service. In addition to turning the wheels. the shafts must support them and the entire weight of the car which rests upon these wheels. Each shaft is locked rigidly at both ends and supported with bearings of various types."

SAFETY FIRST

Quality and Lower Cost Mileage for Goodrich Tire Users

Goodrich Unit Molding is the original "Safety First" idea in tire-making.

❖ ❖ ❖

The body of the tire, the side walls, the fabrics, the rubber, the bead and the Safety Tread are so well balanced and of such uniform high quality that this, coupled with Goodrich efficient workmanship, makes it possible to mold Goodrich Tires as a unit.

❖ ❖ ❖

The fine, strong fabric and high-grade rubber are literally interlocked by Goodrich Unit Molding. This is one reason why the treads do not separate and why "tire troubles" are practically unknown to Goodrich users.

❖ ❖ ❖

The thick, tough rubber bars and crosstie of the safety tread as shown here, *make* a "Safety First" roadway for the car. They clean and dry the path and *grip* it. Because the Safety Tread design is built as a unit, it rides easier than any other non-skid tire, and in fact just as smoothly as a smooth tread.

❖ ❖ ❖

Just the unit-group of bars and crosstie which brace and balance the strain on the tire so that the Safety Tread runs as a smooth tread does and gives more actual service and mileage.

The Accepted Standard

Goodrich Safety Tread Tires

Best in the Long Run

The Goodrich Safety Tread

—Five Bars and a Crosstie
—the "Safety First" Symbol

The quality of Goodrich Tires today is the standard by which all other high grade tires are judged. They represent perfection of tire-making and tire-knowledge—which gives Goodrich Tires leadership.

Pay no more than the following prices for the *accepted standard* automobile tire:

Size	Smooth Tread Prices	Safety Tread Prices	Grey Inner Tube Prices	Size	Smooth Tread Prices	Safety Tread Prices	Grey Inner Tube Prices
30x3	$11.70	$12.65	$2.80	34x4½	$33.00	$35.00	$6.15

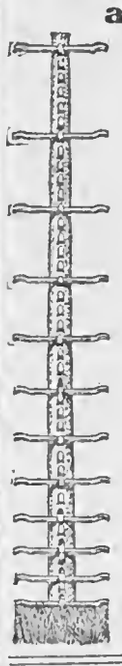
American Steel Fence Posts

Cheaper Than Wood and More Durable



Quality—High-class steel, heavily zinc coated inside and outside.

Strength—Strong enough to hold up any wire fence and furnish all necessary resistance.

Adaptability—Adapted to all conditions and will prove absolutely satisfactory wherever a good wire fence is desired.

Service—Give much more and much better service than can be expected of wood posts, and will not burn, rot or decay.

Durability—Have been in service since 1898, in every section of the United States, and the oldest posts are today as good as when set.

Adapted to All Wire Fences. Increase the life of a fence. Put a wire fence on permanent American Steel Posts and preserve the fence indefinitely; put it on wooden posts and it is like building a brick house on a wooden foundation.

For Sale By All Dealers.

We also make the celebrated AMERICAN FENCE, ELLWOOD FENCE, ROYAL FENCE, NATIONAL FENCE and the ANTHONY FENCE. These fences are galvanized by the wonderful new process we have developed and employed exclusively by us, effecting a heavier coat of zinc firmly united to the steel, affording absolute and permanent protection against destructive elements. The *greatest Galvanizing discovery of the age.* **Dealers Everywhere.**

EVENTS OF THE WEEK.

DOMESTIC.—By the breaking of a suspension bridge across the San Joaquin River near Fresno, Cal., March 28, four men and one woman, crossing in an automobile, were plunged fifty feet into the swift stream and drowned. The bodies were not recovered.

Floods through the Hudson and Mohawk Valleys, New York, March 28-30, caused considerable damage. The greatest damage was done at Schenectady, where 350 families where driven from their homes. The loss at Schenectady is estimated at $750,000, the total loss in the Mohawk Valley at $1,250,000 and the loss in the Hudson Valley, at $500,000. On the Hudson the principal places to suffer are Troy, Watervliet, Albany and Rensselaer. Two men were drowned at Schenectady.

Frank Tanneubaum, the I. W. W. agitator, was found guilty, March 27, at New York, of participating in an unlawful assemblage in the Catholic Church of St. Alphonsus on the night of March 4, and to him was given the maximum penalty—one year in the penitentiary and a fine of $500.

The total number of employees laid off on all the lines of the New York Central system between September and March, reckoned by New York Central authorities, is 27,600. On the Erie 6,000 men had been laid off since December, and the road is now manned by a force 18,000 less than at the height of maintenance and improvement work of last Summer. This latter decrease is in large part due to the nearing of completion of double tracking and improvement work that the Erie has been doing on a large scale.

Mayor Mitchel, Police Commissioner McKay, the Corporation Counsel's office, the District Attorney and the courts have joined in an effort to rid New York of men who carry weapons without permission. The police are also moving to discover the character of men who have permits to bear arms and to learn whether there has been grafting in the issuing of such permits. The legal fee for a permit is $2.50. The authorities have heard that much more than this has been paid, and that licenses have been issued for large sums to persons who should never have had them.

In response to many inquiries from the United States concerning "inheritances now lying dormant in the English Chancery courts," the American Embassy, in London, is now sending out printed circulars trying to discourage Americans in small communities from being led by shyster lawyers and others into the hope that they have a chance of getting money from these ancient accounts. The embassy calls attention to the fact that there are no large unclaimed estates in Great Britain and to the additional fact that the statute of limitations almost always bar recovery.

The American fishing schooner Valiant, which was captured on May 11, 1913, by the Canadian fisheries protection sloop Joliffe, was declared confiscated, March 31, in the Admiralty Court, at Vancouver, B. C. The Valiant was seized by the Joliffe off the northern end of Vancouver Island, where she was alleged to have been fishing close in shore. She raced for the open sea when the Canadian vessel hove in sight, but was overhauled. One thousand pounds of halibut, some of the fish being still alive, were found below. The Valiant was of 18 tons and owned in Seattle.

FARM AND GARDEN.—The pure seed train, under the joint auspices of the Milwaukee Chamber of Commerce, the Wisconsin Bankers' Association and the Agricultural College, Madison, finished its two weeks' tour of the eastern portion of that State at Baraboo, March 21. Free exhibits of grains best adapted to Wisconsin were displayed and lectures given to the farmers en route.

It was announced, March 30, that the United States Weather Bureau is to establish sub-stations in the Connecticut tobacco belt about May 1 in order to enable growers to benefit by the government's service in the forecasting of storms and frosts. They will be under the direction of the Hartford station and will be located at Suffield, Tariffville, Hazardville and East Windsor Hill.

Judge Morton overruled the demurrers, at Boston, March 25, of D. Whiting & Sons, H. P. Hood & Sons and William Graustein, milk contractors, to a Federal indictment alleging a combination to fix the price paid to farmers for milk. He sustained demurrers to two other indictments charging monopoly and conspiracy in restraint of trade. The defendants bought milk in New England and controlled 86 per cent. of the product shipped to Boston and Worcester.

Indians on the Warm Springs agency, in Crook county, Wash., are taking a keen and practical interest in agricultural development, says D. C. Freeman, industrial agent for the Hill lines, who has just returned from the first farmers institute conducted for the redskins of that territory. More than seventy Indians attended the meeting, says Mr. Freeman. Practical agriculturists lectured on farming, live stock, orchards and gardening. L. H. Tiffany has been employed as agency agriculturist to advise the Indians and work with them in their agricultural development.

Experts of the Department of Agriculture estimate that the annual loss from hog cholera in the United States is $75,000,000. They regard its eradication as one of the most serious problems that faces the bureau of animal industry, for the loss caused by it is approximately as great as that from all other animal diseases combined. The loss from hogs killed outright by cholera in 1912 was estimated at $60,000,000. The loss to the hog industry indirectly resulting from the disease was about $15,000,000 more. The cholera is most common in the corn States of the West and South. The two other chief animal diseases are cattle tuberculosis and Texas fever.

INDIANA FARM NOTES.

The past Winter was a mild one up to about the first of February, when severe Winter weather set in. The coldest day of the season was on the ninth of February, when the mercury registered 17 degrees below zero. The first half of March maintained its general features—blustering, blowing, freezing, thawing, etc. The snow has now all gone, and with its disappearance our farmers are taking an account of the growing wheat. There is but one opinion as to its actual state, and that is that it is in excellent shape, and that, barring droughts, there will be a bumper crop. As the acreage is quite large—in fact much larger than last year; this is another feature to encourage the farmers. The fruit is as yet supposed to be safe, although April is the critical time for this. Spring grass seeding is now on hand here and our farmers are wondering whether the catch will be successful or not. It is quite discouraging to sow high-priced seed and have it thrown away because of failure to catch, as has so often been the case in the past. Quite an acreage of Alfalfa will again be started this year in spite of the fact that a strange worm did some damage last year in some fields already started. The pest is the army web-worm, but is said by the experts to be quite easily combated. The latest feature in the labor problem in this section is that farmers here are compelled as a last resort to make application to the Bureau of Emmigration at Washington, for farm help. The help furnished by the Bureau is said to be mostly aliens. Whether such help will prove satisfactory, time alone will tell. But few sugar camps will be opened here, as most of the sugar trees still remaining are so poor as to make tapping them unprofitable. Stock of all kinds has wintered well, as there was plenty of feed. Prices of dairy cows, are still going up, grades now bringing from $60 to $80 while purebreds sell at from $100 to $150. The present prices of farm produce are about as follows: Wheat 94; oats 36; corn, per cwt., 78; rye 57; dressed pork 11; dressed beef 11; dressed chickens 16; potatoes 75; Timothy seed $2.50; clover seed $8; Timothy hay, baled $13; clover hay, baled $11; eggs 25; butter 25; milk at the condensery, $1.60 per cwt., for four per cent. milk. D. L.

Elkhart Co., Ind.

Robins and bluebirds are at last with us, and although we have considerable snow in places our sleighing is gone. Up to this time Winter has hung on so persistently we are in hopes that Spring weather will now stay steadily. People along the Mohawk are fully aware of Spring conditions, as the water is exceptionally high, and several bridges went out this morning. G. R. S.

Saratoga Co., N. Y.

Many indications of Spring are here, birds are daily arriving on schedule time. Farmers are sowing clover seed, pruning and spraying fruit trees. Wheat is beginning to show life and the grass looks green. No hog cholera or any animal diseases we know of. A number of auction sales; horses and live stock selling high; horses $100 to $240; cows $45 to $135; eggs 28; butter 30. Not many farm sales. W. C. W.

Huron Co., Ohio.

The Winter was quite mild and open, with practically no storm until February 22. On that day a heavy mist came on, forming ice everywhere. Trees were broken down, telephone and telegraph wires broken, and the service completely demoralized over the entire State. Snow to the depth of 10 inches fell and a heavy wind piled it into huge drifts, blocking the roads. On March 16 farmers began preparing land for sowing oats. On the 18th another snowstorm came and today, March 19, there are several inches covering the ground. There has been much complaint of wheat heaving out by the alternate freezing and thawing of the land, and it is probable a small percentage of the crop is damaged. Cattle and other stock have gone through the Winter in good shape. Feed is plenty, except corn, which failed last year. Alfalfa hay $9 to $12 in stack or mow; corn 66 out of car; wheat 75; oats 40; potatoes 90. Butter 23; eggs 18. Clover seed $12 per bushel; Alfalfa seed $8; Timothy seed $3.75; apples $1.50 per bushel. Horses $200 down; mules same; cows $50 to $80; fat hogs $8 per hundred. Buying corn has taxed the recourses of our farmers to the limit. It is estimated that $2,000 a day has gone out of this county for corn alone for the last 100 days. H. M. R.

Fairbury, Neb.

HERE'S why the owner of the biggest barn in Minnesota chose Neponset Paroid Roofing:

"Slowly made" roofings are the only kind that wear out slowly. You *can't* make good roofing quickly. Rush the manufacture and you get "patchy," uncertain products. Omit tests and inspections and you get roofing products quick to "run" in summer—quick to become brittle in winter—quick to start a leak—quick to wear out altogether.

Get "Neponset Roofings"—the "slowly made" kind. Nothing skipped. Nothing skimped. Every dollar's cost gives a dollar's worth of durability. Any one can easily lay them. They are the finest kind of insurance against repair bills—fire—and all roofing troubles.

Sold by dealers everywhere. Write for name of nearest dealer

The Home Acre.

BEAUTIFYING THE HOME GROUNDS.

Hardy Flowering Shrubs.

PART IV.

The use of ornamental shrubbery in the adornment of the home grounds could no more be dispensed with than grass in the making of the lawn. The omission of either would leave the grounds with the appearance of being unfinished, if not unsightly and repulsive to the eye. In the planting of shrub beds and borders, careful consideration should be given to the height they will attain, habit of growth, the color and character of foliage, also the color of the flowers and the time of blooming. But few shrubs are adapted for specimens on the lawn, but should be grown in groups containing only such varieties as will produce a pleasing effect. These effects are altogether the result of the habit of growth, foliage and flower of the plants used. In planting shrubs they should be grouped with the idea of producing as natural effect as possible. If in the border, the taller growing sorts should have a rear location; if in the beds they should occupy the center. These tall robust sorts will form a background, against which the dwarfer growing varieties may be arranged in regular order as to their size, until the border is reached, the dwarf or decumbent sorts occupying the outer spaces, so that when they are viewed from any point the eye will be carried from the green lawn to the highest point in the shrubbery without being offended by the sight of bare stalks.

In the proper arrangement of shrubs we not only gain artistic advantages, but the practical as well. The first cost is practically the only cost, and their increasing size and beauty from year to year, return to the owner increased dividends in pleasure that would be difficult of computing. Home grounds liberally planted to beautiful flowering shrubs, usher in the Spring with bursting bloom buds, almost before the ground is bare of snow, to be followed by others in great profusion, as the season advances, reaching the grand climax of beauty in May and June, when the lilacs, Deutzias, Azaleas, Weigelas, Spiræas, Philadelphus, roses and many others are in the full glory of their bloom. Then on into the Summer with the ever-changing floral panorama, until the latter part of July and early August we are favored with another grand display in the blooms of the Althæas with their glorious hibiscus-like flowers of white, pink, purple, red, blue and rose. Hydrangea paniculata grandiflora, with its enormous panicles of snow white flowers, presents the appearance of a great snowbank, when a number of plants are grouped together, which later turn to a delicate pink color, remaining until late in the Autumn.

At the close of the season when the days are shortening and the nights growing longer and cooler, warning all nature to prepare for a season of rest, those of us who have enjoyed the beauty of the hardy flowering shrubs on our own grounds, for the first time, can mentally review the delightful changes they presented to us for our enjoyment the past season, and appropriately say, "There may be better and more delightful seasons in store for me, but no season of the past as good to live in as the one just closed."

K.

Raising Potted Plants.

Could I succeed in raising potted plants on an east porch sided up with glass on the east and partly on the south side, the other sides being filled in with rest of the building? The place would be heated with a stove. G. G.

Small quantities of pot plants are often successfully grown by amateurs with apparently uncongenial surroundings, but the location suggested does not sound at all promising. A porch with an opaque roof, house walls on north and west, and only the east side entirely glass would be very dark. Some foliage plants succeed in such locations, but few flowering specimens, and the unequal distribution of light would tend to produce one-sided growth. Such a glass-enclosed porch would add much to family comfort during cold weather, but we should not expect it to be a paying investment as a plant grower.

THE USE OF COMMERCIAL "HUMUS."

Utilize Your Own Supply.

PART II.

PRACTICAL ILLUSTRATION.—To give a practical illustration, the analysis of a six-year-old hen, or rooster, might be identical with that of a broiler or a Spring chicken, yet who would pay the same price for the two kinds of meat, even when they were told that the analysis was the same? The same might be true of an ancient sheep and a hothouse lamb. In fact the chemist would hardly be able to tell the difference in his laboratory between a piece of flesh cut from a wolf, and another cut from a pet terrier dog. The flesh of the wolf, or of the hardy rooster, might actually show that the meat was stronger and contained more protein than that of the dog or the broiler, but those who bought the broiler or the dog would go beyond the analysis, and find out whether what they were buying was exactly suited to their needs or not. It is just exactly the same with regard to the purchase of fertilizers, and also in the purchase of this black soil or humus. No farmer should consider the argument that the nitrogen in this humus would last longer than that in chemicals. If a farmer were investing his money, he would want to put it where he could get sure and immediate returns, and not tie it up so that an equal amount of interest would come dribbling to him through a long series of years. It may well be laid down as a sure, definite rule in farming, that when a man buys plant food at all, it will pay him to buy the available and soluble kinds, rather than the inert, insoluble material for which he must wait years in order to obtain returns. Any man who has a pond hole, or muck swamp on his farm, can obtain the humus he needs through the use of lime largely as a return for his own labor.

FILL THE LAND.—By means of cover crops grown in the months when the land would otherwise be idle, he can by the use of available plant food, fill his land with humus or organic material very much cheaper and in very much better shape than by buying these unavailable forms of humus at a high figure. These chemical forms of black soil or humus have a fair place in agriculture. That is proved by the fact that it pays a farmer who has a swamp to haul this material out and use it. Such a man, however, who has a swamp of this kind, would not be justified in buying humus from another man's swamp at three or four times what it would cost him to haul the material out of his own pond hole or pasture. So long as this humus is presented for just what it is, without extravagant claims or unfair comparisons with manure, it is a legitimate product, and there are places where its use might be economical. In buying it, however, a farmer should remember that the greater part of its nitrogen is inert and not immediately available, and that he is paying when he buys such material about 18 cents a pound for nitrogen which the chemists declare is not worth over four cents.

BAD FARM ECONOMY.—We heard from one farmer in Georgia who thought of buying this "humus" in carload lots as a fertilizer for cotton! The freight would be $3 or more per ton. Right on his own farm was a low piece of land with thick layers of black soil. This stuff hauled out, limed and dried and spread on his land would enable this farmer to grow cow peas and Crimson clover to plow under. This would form the finest "humus" in the world. Another man in Ohio with a ledge of limestone right in his own neighborhood was considering the purchase of a fancy brand of lime at $10 per ton! Under a fair system of farm management it would be hard to think of a more extravagant way of farming than either of these plans.

Training Young Trees.

I am going to set out about 200 apple trees this Spring. I would like to know which would be the better way to do with these trees, cut them back, or leave them just as they come from the nursery, merely cutting out limbs that cross each other? Some people recommend planting the trees just as they come from the nursery, claiming they come to bearing at an early age, then cutting them back. Which do you think is advisable?
Adams Basin, N. Y. R. F. E.

Cut the trees back severely. They will not make a good shape if left as they come from the nursery. By cutting the tree back you are able to shape the head to suit your plan. We buy young trees, one year, and cut back to a single stem below the crotch—leaving two feet or a little more above ground. The roots are also cut back to five or six inches long. On an older tree we should cut so as to leave three or four buds above each limb of the crotch, leaving an outside bud at the end of each limb. A tree cut back in this way will make a better growth and a better head. Some planters put the tree in as it comes from the nursery and trim it later. We find it better to trim root and top before planting.

Smudging to Protect Fruit.

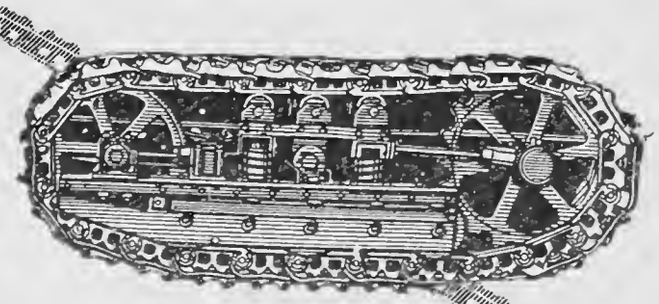
Smudging to prevent frost damage may be practical in some instances; however the writer's experience was a failure on several occasions. Having half an acre in strawberries in full bloom when frosty nights occurred, we collected a lot of stumps and other trash, wet corn fodder, etc., in the evening then arose after midnight and started fires all around, creating a dense smoke on one of those clear crisp frosty mornings when the heat is forced upward by the cold air pressing down. The smoke or smudge rose straight up skyward, resulting in no value but that of experience. I have decided to buy what berries and fruit we want in future when we lose the crop through frost.
Pennsylvania. W. H. STOUT.

Commercial Apples.

I have often thought a great mistake was made in planting for market the fancy varieties of apples which do not bear well. I believe in planting a commercial apple orchard quality should by all means be considered, but it must be combined with quantity if the orchard proves a success financially. It is true very often the finer varieties are not so hardy, neither do they bear as well, and after all they do not bring any more money on the market than many of our good standard varieties which have been grown successfully for years, and proved themselves money-makers. I should advise planting such varieties as are known to be regular bearers, and at the same time of as fine quality as possible.
New Jersey. JOHN H. BARCLAY.

"MY idea of happiness is to see the statue of Liberty in New York harbor from the deck of a returning steamer." "And why do you think you would enjoy seeing it?" "Because I've never been abroad."—Cleveland Plain Dealer.

This Tractor is Different



Caterpillar motors have a high reputation for good work. Even our competitors praise it. Four cylinders—giving steady, even power. Splash lubrication—simple and dependable. Dust proof construction. Ample cooling system—keeps the motor cool in the hottest harvest field. All parts easy to reach—from a standing position on the ground. Even the pistons are taken from the side of the crank-case—without disturbing the cylinders.

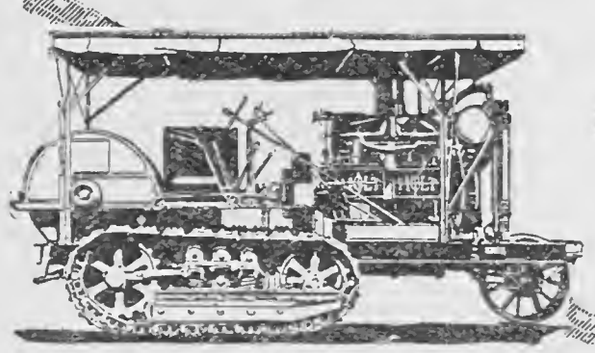
30 h. p. CATERPILLAR 60 h. p.
Reg. U.S. Pat. Off.

The Caterpillar transmission is just as remarkable. There is no differential gearing. Each Caterpillar track is separately controlled by a friction clutch. You can pull with all the power on one track at a time and turn short, or—and here's the point—on both together while you are going ahead. There is no differential to let one side slip when you don't want it to. The gears are cut steel—enclosed in a dust-proof case and running in oil. Our forty-three years of manufacturing experience have taught us to be thorough.

But the Caterpillar tracks are the important difference. They allow the Caterpillar to work anywhere—on any soil, whether wet, loose or slippery. They support the tractor as a board placed over a mud-hole supports the weight of a man. *They never mire or pack the soil.* The pressure to the square inch on the ground is less than seven pounds—less than the weight of a man.

The Caterpillar does all its work well—instead of a few things poorly. It works twice as many days a year as the ordinary tractor. It plows, harrows, harvests, hauls, builds roads, fills silos, saws wood, and a hundred other things.

Send for catalog AI 18. Read about the many kinds of work the Caterpillar is doing all over the world. Investigate the claims of Caterpillar owners. There are about two thousand Caterpillars in operation.



Service branches everywhere.

Planet Jr.

No. 25 Planet Jr Combined Hill and Drill Seeder and Double Wheel Hoe, Cultivator and Plow

A capital implement for large-scale gardening especially. It has steel frame, and complete seeding and cultivating attachments. The hoes run close to row without danger to leaves or roots. Two acres a day can be easily worked with this tool.

You need these scientific soil-tillers to save time, lighten labor and get bigger crops from your farm and garden. Planet Jr tools are backed by more than 40 years' experience. They range from $2 to $100, and are fully guaranteed.

FREE Our new 72-page illustrated catalogue of 60 of the latest tools, for *all* cultivation. Write postal *today*.

S L ALLEN & CO
Box 1107V Philadelphia

No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow

This is a practical every day time-, labor-, and money-saver. It combines in a single implement a capital seeder, an admirable single wheel hoe, furrower, wheel-cultivator, and a rapid and efficient wheel garden plow. Sows all garden seeds in drills, or in hills 4, 6, 8, 12 or 24 inches apart.

IMMEDIATE SHIPMENT GUARANTEED

No. 16 Planet Jr Single Wheel Hoe, Cultivator, Rake and Plow

The highest type of Single Wheel Hoe made. It is light, handy, and adapted to use by man, woman, or child. Has leaf guard for close work, and a durable *steel* frame. A most useful tool in the family garden that makes the work really a spare-moment pastime.

No. 8 Planet Jr Horse Hoe and Cultivator

The best-known cultivating implement made. It is so strongly built that it withstands incredible strain, yet it is light and easy to handle. Has new steel wheel—will not clog with stones or trash. Cultivates to any depth and adjusts to any width. Opens and closes furrow, and hoes right up to plants without danger of injuring them.

No. 11 Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake

The greatest cultivating tool in the world for the grower of garden crops from drilled seeds. It has steel frame. The plow opens furrows for manure, seed, etc. and can be reversed for covering. The cultivating teeth are adapted for deep or shallow work and for marking out. Crops can be worked both sides at once until 20 inches high.

Farm Management.

Cost of a Yearling Orchard.

As I see that you are trying to find out orchard costs, I send you mine. Last year I planted six acres to apple trees, 40x20 feet; that is, fillers one way only; about 100 cherry trees among these. It is just about a year since, and the enclosed figures show all expenses of labor and material, except interest and taxes. As you see, I sowed oats on the same land, costing me $31.45, receipts $78, profit $46.55, as against one year's expense on the orchard of $126.19. This is all the expense; land cost $27 an acre.

PAID OUT, 1913.

Plowing, 6 acres (1912)	$15.00
424 trees, one year old	54.22
Marking	3.00
Digging holes	10.00
Planting	6.00
Trimming after planting	2.00
Spray	3.00
Manure, mulching	11.00
Fertilizer, 4-6-8	3.67
Fertilizer, application	2.00
Spraying for lice, 2d and 3d times	3.00
Plowing strips toward the tree Sept. 15	5.00
Manure (part) Winter covering	3.00
Lime sulphur for rabbits	2.00
Wrapping for rabbits	3.30
	$126.19

Oats: Paid out:

Harrowing, seeding, 6 acres	$10.00
(Plowing charged to trees; see above.)	
Harvest	10.00
Seed	7.95
Thrashing	3.50
	$31.45

1½ ton straw at 12.00	18.00
	$78.00

Hudson Valley, N. Y. D. E. S.

Do Not Mix Lime With Chemicals.

Tell me as to mixing lime with phosphates. I have acid phosphate, 5,344 pounds; muriate potash, 450 pounds; dried blood, 800 pounds; nitrate of soda, 200 pounds. My farm is light sandy soil. I wish to mix these chemicals with lime. How many pounds of lime should I use, and how many pounds of this mixture should I use per acre with oats, with silage corn, and with potatoes? I shall drill in oats and corn. F. J. K.

Barneveld, N. J.

If these chemicals are of average quality they will contain in round numbers about the following:

	Nitrogen	Phos. Acid	Potash
5,344 Acid Phosphate		750	
450 Muriate of Potash			225
800 Dried Blood	96		
200 Nitrate of Soda	32		
Total	128	750	225

This means a mixture containing 38 pounds of nitrogen, 220 pounds of phosphoric and 66 pounds of potash to the ton. It would be called a 2-11-3½ fertilizer. There is not enough potash unless you are sure that your soil is quite rich in that element. Do not mix any lime separately—broadcast. The lime will make the phosphate less available and if not used in the ground at once will set free some of the ammonia in the dried blood. We should add 200 pounds more muriate of potash and use per acre 300 pounds for oats, 400 for corn and at least 800 for potatoes.

Fixtures; Cement Test.

1. Were shingles in bunches ready to use, real estate in New York State in years of 1910 and 1911? Were wire in rolls and bench vice real estate the same years? 2. How can I tell when I am buying good cement? Is there some test? Vermont. J. H. B.

1. There is not enough information offered to indicate properly whether the shingles, wire and bench vice are real or personal property. As a general thing, if they are loose and have not been affixed to the realty, they are all of them personal property; but if they have been annexed to the real estate—that is, the shingles put on the house and the wire made into a fence—they would part of the real property and would not follow the tenant. On the matters stated, it would appear that all three are personal property.

2. There is no way you can test cement until after it is mixed, when there are machines for testing its tensile strength; but for all purposes around a farm, any of the standard Portland cements found advertised in responsible papers are sufficiently good.

ECONOMICAL HOUSE-BUILDING.—Will some of your readers give advice on the most practical house that can be built at smallest cost, concrete, hollow tile or frame? Also, practical ideas on inside finishing, whether plaster or wall board? House to be constructed to withstand cold as well as heat. M. M.

Croton-on-Hudson, N. Y.

MANURE PITS.—I have read quite a number of inquiries concerning manure pits. I will give you a description of mine, which works very satisfactorily. It is 12x40 feet inside, with seven feet walls 12 inches underground and eight inches thick above ground, reinforced with woven wire fencing. On the four-inch shoulder, the difference in thickness in wall, are placed 4x4 inch timbers, which also rest on a bearing timber through the centre. We placed the timbers one inch apart so as to let the liquid through in the liquid pit which is 2½ feet in depth on one end and 3½ feet on other, so that the liquid will drain to one end when being pumped out in wagon tank. This makes the pit for manure 3½ feet deep, which is the height of the wall above ground. My reason for making pit long instead of square is that you can drive on either side with spreader and you can easily reach to centre of pit with fork which I think is better than having an opening in wall to drive in and out as they have to with square pit, and as we use a automatic carrier it makes it easier to keep the manure level than if it were wider. A. H. B.

Cherry Valley, N. Y.

THE BACKYARD FARMER, by J. Willard Bolte. This book is written especially for the amateur gardener but with a knowledge of the subject that gives the book a practical tone. In addition to gardening and orchard work, there are brief talks on bees and poultry. The garden planting calendar is a useful one. Published by Forbes & Co., Chicago; 238 pages; price $1.00.

How To Make Your Garden Thrive and Mature Early

The kind of plant-food required in your soil depends on the kind of a crop you are to raise. In order to make your garden produce its maximum yield at the lowest cost for fertilizer you should supply only those elements which are immediately available and which will be absorbed by the plant.

Consumers Brands

For Gardeners, Fruit-Growers, Florists and General Use

Comprise special distinct compositions of plant-food elements for vegetables, small fruits, root-crops, flowers, greenhouses, lawns and tree-crops. They supply only the constituents your particular soil needs for some special crop. For example our

Early-Crop Odorless Fertilizer

supplies your soil with the four plant-food elements in immediately available form needed by vegetables and small fruits for quick growth and early maturity. It is the most effective and convenient fertilizer you can apply for such crops and in the end the most economical.

Write today for our *free* Fertilizer Booklet—it is full of valuable information and is as valuable as a text-book on soil fertility.

Special Parcel Post Offer

Our Mak-Gro Odorless Plant Food is a clean high grade granular fertilizer for indoor and outdoor use on potted plants, flowerbeds, small fruits, lawns and small gardens. It is *made especially for the amateur* and is pleasant to apply. We will mail a five-pound bag to any address for $1.00. Write today for special circular.

HUBBARD'S BONE BASE CONNECTICUT FERTILIZERS

Start NOW

and plan for that big crop you have been thinking about and looking foward to for years.

Hubbard's BONE BASE Fertilizers

will do for YOU what they are doing for hundreds of others.

BIGGER BETTER crops are the inevitable result when they are used consistently. Read what Oscar Widmer did the first year he used "Bone Base" Fertilizers.

Wappingers Falls, N. Y., Dec. 1, 1913.

The Rogers & Hubbard Co.,
Middletown, Conn.

Gentlemen—My first year using Hubbard's "Bone Base" Fertilizers was very satisfactory. We had a very dry season, but in spite of that fact my Oats yielded over 50 bushels per acre. I used 200 pounds per acre of Hubbard's "Bone Base" Complete Phosphate. We also used this brand on our vegetable garden with excellent results

We entered in 32 classes at the Poughkeepsie Fair, winning 25 first prizes and 7 seconds. One class was a collective exhibit of not less than 25 varieties for a prize of $25.00. In this class we were pitted against F. W. Vanderbilt's gardener, winning by a good margin.

Also in the Beets, Pumpkins and Squashes we carried away every "Blue" offered by the Fair association. So you can understand that we think Hubbard's "Bone Base" goods, as well as ourselves, are "Some Pumpkins."

I am very truly yours,
OSCAR R. WIDMER.

Write today for our booklets, **"Soil Fertility," "The Grass Crop," "The Apple,"** and **Hubbard's Bone Base 1914 Almanac,** which contains much valuable information about soil, fertilizers and other farm subjects. Sent free to any address.

Tomato-can Bird-house.

The little picture shown below is taken from an article by Frank C. Pillett of Iowa, at the Missouri State Horticultural meeting. He puts up tomato cans as shown in the picture for the bluebirds to nest in. The English sparrows drive the bluebirds away, bnt these sparrows were destroyed and then the other birds eame back. Two families were reared

TOMATO CAN BIRD HOUSE.

in one of these cans the same year. Wrens also took these cans for their homes.

Plant Lice.

Can you inform your readers what makes and what will cure lice on plants?
Bridgeton, N. J. L. M. P.

Aphid or plant lice infestation results from the presence of the insects in the soil, or from the vicinity of other plants already infested. Remedies commouly used are kerosene emulsion, tobacco, soap and pyrethrum. The dry pyrethrum powder or dry snuff is effective, when sprinkled over plants, but untidy in appearance. Pot plants may be dipped in hot water (120 to 125 deg.) without damage, but with complete destruction to the aphides. Pyrethrum powder, one ounce in three gallons of hot water, stepped 24 hours, is an excellent wash for aphis destruction; also tobacco tea, stems or dust well boiled, then diluted, giving the proportion of one pound of tobaeco to two gallons of water. It may be necessary to use remedies more than onee, as there will be re-infestation until all the insects are destroyed; they multiply with great rapidity.

Diseases of Cucumbers and Cabbage.

Can you suggest any remedy for what is known as downy mildew in cucumbers and melons, also for club or clump-foot in cabbage, kohl-rabi, etc. These crops to be grown in a garden that has been under cultivation for 10 years. G. C.
Floral Park, N. Y.

Downy mildew in cucumbers and muskmelons is quite prevalent in many sections along the Atlantic seaboard, causing much loss to growers of these crops. This disease may be effectively prevented by timely and frequent spraying with 3-6-50 Bordeaux mixture. Nothing weaker than this should be used; in some districts the 5-5-50 formula is largely used. It is quite important that the spraying be thoroughly done, every part of the plant must be covered with a fine spray. Spraying should commence as soon as the plants begin to run and continued at intervals of 10 or 12 days thereafter until the danger seems past.

Although club-root in cabbage has been known for a hundred years or more, no specific remedy has as yet been discovered for its cure or control. It has been observed, however, that it is more prevalent in acid soils than in sweet soils, and that it is seldom present in soils containing deposits of sea shells in considerable quantity, and on lands that have recently been heavily limed. Lime applied in large quantities destroy the slime mold which is composed of a plasmodium or mass of motile protoplasm, which is situated within the tissues of the plant. At the breaking up of the plasmodium, innumerable spores are released. At this period the lime becomes most effective, destroying the great majority of the spores before they can reach and attack a new victim. The treatment of the soil with lime is the only known means of control and air-slaked lime should be applied at the rate of 65 to 75 bushels to the acre every few years. The liming should be done some months in advance of planting. If an early Spring crop is to be raised the lime should be applied the previous Fall or early Winter. For late cabbage and allied crops the lime may be applied early in Spring.

When possible a system of crop rotation should be practiced, and as the disease will remain for several years in the soil, there should be several years intervening before cabbage or any of its allied species is again planted on the land. Club-root very often gets its start in the young plants in the seed bed, by reason of using infected soil, great care should be taken in the preparation of the seed bed that the soil is not taken from any portion of the grounds where cruciferous plants have been grown. K.

Coal Ashes for Improving Soil.

I have a lot of hard coal ashes. Is it fit for the soil, which is sour? I have one piece that was in cow peas last year, plowed under and then put in rye. I have another piece I shall put in cow peas this year. Would it do on either of these pieces? Would it hurt or benefit early potatoes? J. W. G. C.
Clayton, Mo.

Coal ashes carry very little plant food. There will rarely be more than three pounds each of potash and phosphoric acid in a ton, with little or no lime. As a fertilizer, therefore they are hardly worth considering. Yet they often give results when used on heavy stiff soils. This is because they open such soils and let in the air and moisture. They help light soils for the opposite reason, making them more compact. We should use them for this soil effect, but not with any thought of their plant food.

MAGISTRATE: "Officer, what is this man charged with?" Constable: "He's a camera fiend of the worst kind, yer worship." "But this man shouldn't have been arrested simply because he has a mania for talking pictures." "It isn't that, yer worship; he takes the cameras." —Credit Lost.

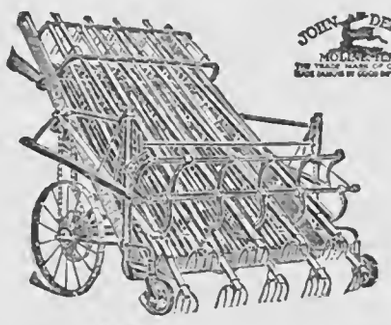
Use a



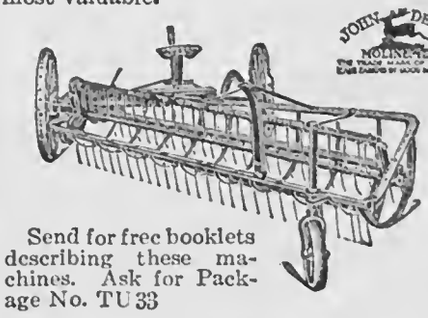
Dain Hay Loader

Load your hay onto the wagon with the Dain, the one-man rake bar hay loader that gathers up all the clean hay but leaves the trash. Rakes operated at exactly right speed to require least power. Strokes of rakes overlap, raking the ground twice. Hay is gathered from swath the full width of machine, regardless of mower used. Change to windrow work easily made. Automatically adjusts itself to handle light or heavy hay and never chokes up. Pushes hay onto center of wagon so that only one man is needed,—the driver. Ask us about other superior features.

Dain Side Delivery Rake

The Dain is the side delivery rake with the steel arch supporting the frame and a reel with three sets of closely succeeding flexible teeth, a construction which means both durability and gentle handling of hay.

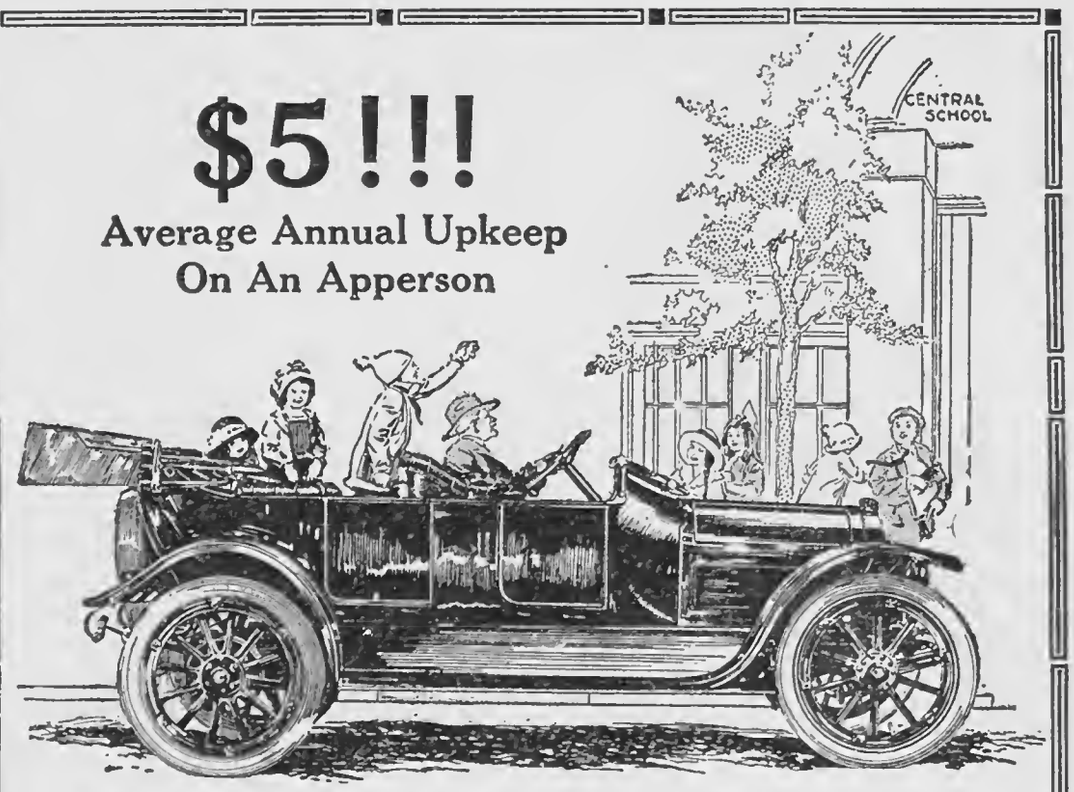
The ground is raked clean and the hay left in fluffy windrows through which the air can readily pass so that it is cured without sun-scorching. The best quality of hay and therefore the most valuable.



Send for free booklets describing these machines. Ask for Package No. TU33

JOHN DEERE, Moline, Illinois

$5!!!
Average Annual Upkeep
On An Apperson



THINK of it! The average annual upkeep on an Apperson Automobile only $5! Our total business in parts last year, **on 17,000 cars,** our output for the last 15 years, was $95,000. That brings the average about $5.00 a car.

And a big percentage of these efficient and **more than economical cars** are owned by progressive farmers in every section of the country.

You don't have to worry about heavy maintenance and repair costs when your choice is the efficient, always-in-service

Famous Apperson "Jack Rabbit"
"The Wizard of the Hills"

Economical upkeep is only one feature When we make an Apperson we build enduring efficiency into its very vitals. Elmer and Edgar Apperson built the first automobile. They are still building America's first and best cars.

Write at once for De Luxe Catalog and full information about Apperson "$5-A-Year-Upkeep" and other facts. We will prove why we can profitably produce our new Four Forty-five at $1785, our Light Four Forty-five at $1600, our Six Forty-five fifty-eight at $2200.

Any Farmer Can Now Do His Own Blasting

Atlas Farm Powder never explodes spontaneously or fails to do its work. You can use it without trouble or risk by following instructions that even children understand. Sylvia Richmond, 14-year-old champion tomato grower of Hamilton County, S. C., won because she blasted the subsoil. By using

Atlas Farm Powder
THE SAFEST EXPLOSIVE

you can improve your soil, get out stumps and shatter boulders quickly and cheaply, blast holes for tree planting, and do many other kinds of farm work in the most economical, up-to-date way. You need no expensive equipment. Atlas Farm Powder is put up in half-pound charges, ready to use as soon as you attach cap and fuse. It costs little and is sold by dealers near you, who can supply you quickly. We will tell you exactly what you need for any kind of job.

Send Coupon for "Better Farming" Book—FREE

Our large illustrated book, "Better Farming," tells you how to increase fertility of the soil, dig ditches most cheaply, and improve the farm in many ways by using The Safest Explosive. It is valuable to every land owner. Free for the coupon—fill out and mail it now.

Hope Farm Notes

GIFT OF SEED CORN.

If your neighbor was out of seed corn you would help him to a supply. If his home had been destroyed and a great misfortune had swept over him you would get out with others and help put him on his feet. That is true neighborly feeling. The more we have of it the better off we all are and the closer we get to that big brotherhood and true coöperation which we know must come before we can make this world what we want it to be, and what our children should have.

"Who is my neighbor?"

Not alone the man whose farm touches ours, or who lives in the same valley or country. Any man who is in need or who faces a great calamity or who has met with great misfortune. In other words, any man who is sorely in need of your help is your neighbor in the larger and better view of humanity.

Now listen to this.

Men, farmers and therefore neighbors are dying of hunger in their ruined homes in Albania. On the map you will see that this country lies to the southwest of Turkey. Wm. W. Howard has just returned from a 400-mile journey through the mountains of Albania. Last October the Servian troops destroyed 100 villages, burned or blew up 12,000 houses, killed 8,000 people, drove off the live stock, and destroyed the Winter supply of grain and fodder. As a result thousands of men, women and children are without shelter and food, and what is worse, without seed for the next crop.

The chief grain crop in these mountains is corn. The local varieties are small flints of an inferior quality. New and improved seed will mean wonders for the future of that country, aside from the pressing need for food. Now will you give your mite to help these unhappy neighbors in their trial? We do not ask for money. A few wealthy men will take care of the expense of distributing and handling. You can help by sending what you can spare of seed corn by parcel post. For the mountains flint varieties from New England and the northern part of the country are most desired. For the richer plains and valleys dent varieties from the West or Middle West will answer. A good quantity of Hope Farm flint will go, and this appeal is made to you—not for money, but for as much seed corn as you feel that you can spare, and the postage to carry it by parcel post. Such seed will not only produce food for starving people, but it will grow into a blessing as well. Will you write me at once what you can do? I will give directions for sending the seed.

TREES ON FENCE ROWS.—I find a good many people who buy farms and conclude that they can plant all the fence rows to fruit trees. Their argument is that they can, in this way, economize space. Their fence rows ought to give them a good fruit supply, while the fields are left clear for farm crops. The claim is that these fence rows or stone wall lines always show strong soil. So they do, but such soil is full of brier roots and weeds, and trees planted there require extra good care. To plant a tree on these rows and then let it alone is to invite some disaster. You cannot plow or cultivate close up to the fence, and unless you are willing to do much hand work the tree will suffer. We have grafted seedling trees in such places and had them do well. Such trees have formed a root system which adapts them to rough and ready culture, but the nursery tree planted in such a situation cannot endure what the seedling can. It must be hoed and kept clean for a circle of at least three feet and the trash must be kept down. Most people neglect to do this, but leave the tree to grow alone on that "strong ground," and it becomes a stunt or the borers get it. Better keep away from fence rows unless you are willing to do much hand work.

Should I lime my corn ground after plowing sod under, or wait until I seed it down to grass? It needs lime. Shall I plant potatoes on the same field where potatoes were planted last year and seeded down to rye? Both fields are alike. M. R.
New Jersey.

Of course a man should see these fields and know all about them before giving any decided answer. Generally speaking I should plow this sod and plant corn without liming—but use the lime when seeding down. Corn does not respond to lime as oats or wheat do, while grass needs lime. By working in the fresh lime at time of seeding you will give the grass a better chance. On general principles I would plant potatoes on the corn land rather than follow potatoes once more.

I have no stock and have a great quantity of straw. What is the best to do to get it back on the land? T. J. B.
Iowa.

I should haul it out, spread it much the same as manure and plow it under. Do this in the Fall or early Winter if possible, so as to let the straw rot all it will. I have known cases where farmers ran this straw through a fodder cutter before spreading it, but this would hardly pay. Here is the amount of plant food in a ton of straw:

POUNDS TO THE TON

	Nitrogen	Phos. Acid	Potash
Oat straw	12	4	25
Wheat straw	10	3	12
Rye straw	10	6	17

In our country such a thing as you speak of doing would be called very wasteful. We can sell rye straw for $20 and more per ton, while the plant food in that ton is worth only about $3.

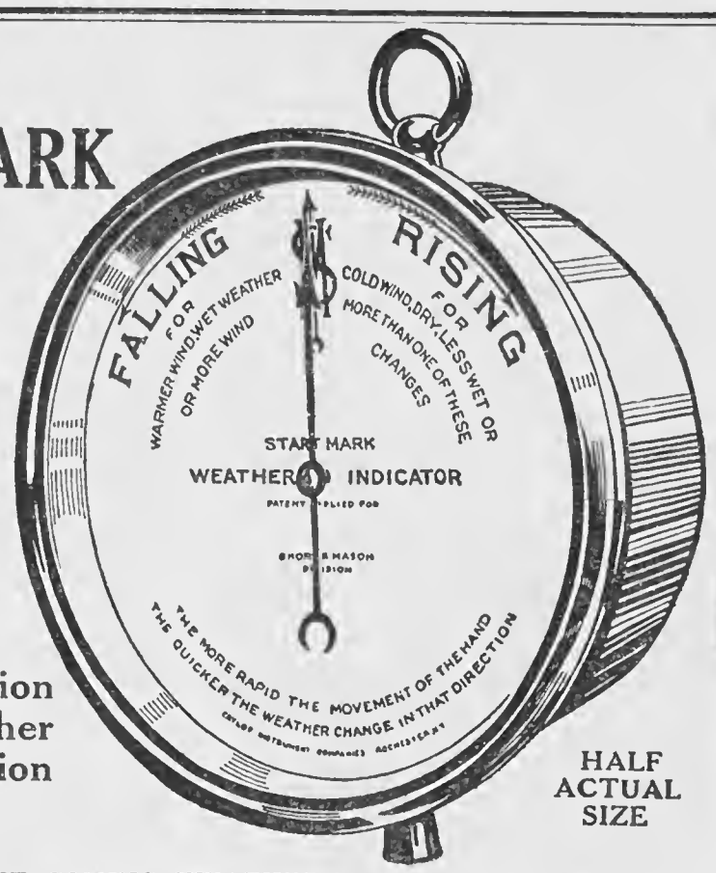
We have large apple orchards (10,000 bearing trees) and the humus problem is on account of our hilly land. Our State orchard expert advises to use one part nitrate of soda and three parts acid phosphate, six to 10 pounds per tree for bearing apple orchards whose condition and production are not satisfactory. Would a mixture of one part acid phosphate and four parts duck manure applied at rate of 20 pounds per tree, be a good substitute? What is relative value of ammonia and phosphorus in the two mixtures. Would it be advisable to sprinkle the acid phosphate over the floor of the duck sheds as the manure is made, or wait until ready to apply it? The manure is kept in sheds comparatively dry and run through an old thrashing machine before using. It comes from a large duck ranch where thousands of eight to 12-week old ducks are grown and fattened for the market, and old stock kept to supply the eggs. Would applying the acid phosphate to the runs of the young ducks be injurious to them in any way? Would floats be a cheaper or better source of phosphorus from the acid phosphate in this instance? J. W. W.
Virginia.

For apple trees we think the duck manure will answer. It will be slower than the nitrate, but with a crop like apples the organic forms of nitrogen will answer. The availability of the nitrate as compared with the duck manure would be about as 100 to 75. Why not use potash also? The trees will need it unless you know the soil is rich in that element.

TESTING NURSERY TREE.—The Babcock fat test for milk revolutionized the dairy business, as it provided an easy way of deciding the value of a sample of milk. The water in 100 pounds of milk was of no value; the butter maker bought it for the few pounds of fat mixed in with the water. When he could tell quickly just how much fat he was buying his business came down to a scientific basis. This principle is now being introduced into all sorts of products. Even coal is to be bought by sample on the basis of the units of heat which it contains. The fat test of milk is so familiar, and has been so useful, that farmers apply the name "Babcock" to any method of preventing the blind purchase of an article by applying a quick and sure test. Thus we speak of a Babcock test for nursery trees. This is very simple. You take cuttings from the trees as they are unpacked, and graft them into strong and healthy trees, as you would regular scions. They will come into bearing in two years or more, and show whether they are true to name or not. It is probable that the test can be quickened by grafting into dwarf trees, as such dwarfs are likely to force fruiting earlier than standards. H. W. C.

"If you don't mind, sir," said the new convict, addressing the warder, "I should like to be put at my own trade." "That might be a good idea," said the warder; "what may your trade be?" "I'm an aviator," said the new arrival.—Credit Lost.

This
START MARK
Weather
Indicator
Will Save
You Money



HALF ACTUAL SIZE

Your best protection against the weather is in the prediction of it beforehand.

A KNOWLEDGE OF THE COMING WEATHER is of the greatest use to the average farmer. If he knows it's going to rain tomorrow he will not cut his grain today. This **START MARK Weather Indicator** enables him to gather his crops under the most advantageous conditions. This means more money for his crops, because they are in better condition.

How Important is it to you or how much is it worth to you to know the weather 24 hours in advance for the rest of your lifetime?

The **START MARK Weather Indicator** is an instrument which has been simplified so its indications can be easily understood, giving a knowledge of local conditions. Books and charts are entirely unnecessary to obtain the desired information. As easily read as an ordinary thermometer.

The case of the **START MARK Weather Indicator** is of brass, polished and well lacquered. The dial is enameled metal. The workmanship throughout is of high *TYCOS* quality. Sold by the leading Opticians and Dealers in Barometers, Thermometers, etc. If your dealer cannot supply you, or will not order for you, write us. Price, $7.50.

Mfd. by Short & Mason Division
Taylor Instrument Companies, 218 Ames Street, Rochester, N. Y.

We also make *TYCOS* Thermometers for all household and general utility purposes. Check the thermometer in which you are interested, mail this coupon to us with your name and address, and we will send you literature describing its uses.

"CORONA DRY"
Arsenate of Lead
Patented June 10th, 1913
Eliminates guesswork. Standardizes the strength of the spray mixture. Saves work in mixing—no straining needed.

Spray with a mixture that *always* has the same strength. You cannot use a paste arsenate and be sure of uniform strength. *Large and practical usage in all sections, for all purposes, has proved* that in "Corona Dry" you do get this very thing plus highest poisoning power, and absolute safety from "burning."

Largest and Most Progressive Growers Everywhere

say that "Corona Dry" has proved efficient—has always the same high efficiency—is more simple, cleaner and easier to handle than a paste material—is easily mixed and needs no straining—can be measured easily and correctly. "Corona Dry" positively kills and exterminates *Coddling Moth, Curculio and all leaf-eating insects* of both fruit and shade trees. One pound of "Corona Dry" will do the work of three pounds of paste and do it better. Write for booklet. Ask for Corona "Tree Insurance" Policy. Address

Grafting Questions.

I have a few native plum and cherry trees which have grown very well. When they bore the fruit was poor, and a friend grafted them; every graft grew. Some of the plum trees include six different kinds. The trees were grafted about March 26, before the sap began to run, and the scions were taken from the trees and grafted immediately. Would you tell me whether the same thing can be done to apples, pears, or grapevines? W. D. K.

It is easier to graft apple and pear trees successfully than plum and cherry trees. Grapevines are more difficult to get to live. They must be grafted very early and below the ground and then banked up with earth to nearly the uppermost bud on the scion.

H. E. VAN DEMAN.

Grafting the Kieffer Pear.

I have about 50 Kieffer pear trees just commeneing to fruit. Which would be best to do—graft them (if so what to), bud them or cut them down?
Auburndale, Mass. C. B. C.

The Kieffer pear may be readily worked over with other and more desirable varieties, either by grafting or budding, the size of the trees determining the method of graftage to be employed. Cleft-grafting is the most common and successful method in general use, and should be employed when the body or main branches are an inch or more in diameter. When the body of the tree is not over two inches in diameter above the first set of limbs, it is a good plan to remove all the top above them, leaving a stub four to eight inches long, in which insert two scions by the cleft method, and when they have made some growth remove the remaining branches so that the entire strength of the tree may go to the growth and development of the grafts. When the trees are large the main branches must be worked at points that seem most suitable, but the work should be done in such a manner that when the new top has developed the tree will not be out of general balance, but that the original outline of the top be preserved as nearly as possible. Small trees will have to be whip-grafted or budded. The best time for grafting is in Spring, when the leaves are pushing forth, and if the work is properly done at this time very few of the scions will fail to grow. Budding is done in August, when the second flow of sap is running freely.

The Bartlett is the standard market variety, but when a number of sorts are desired the following list of varieties will be found very good, and covers the entire pear season: Summer pears, Bartlett, Clapp's Favorite, Autumn, Beurre d' Anjou Beurre Bosc, Buffum, Seekel, Winter, Lawrence, Vicar of Wakefield. For description of the above sorts see nursery catalogues. K.

Scale on Ivy.

Enclosed is a leaf from my English ivy plant that has been in the house all Winter. Lately I have found this scale on the leaf. Tell me what it is and how to deal with it. T. M. P.

Sponge the leaves with soapsuds, thus removing the scale insects. Whale-oil soap dissolved in hot water and diluted so as to give one pound of soap to six or seven gallons of water, is excellent, but rather unpleasant to use. Fir-tree oil and several other preparations sold by seedsmen, are excellent for use in such cases, but careful sponging with ordinary soapsuds is usually efficient. The trouble is not uncommon with house plants.

Long Island Apples.

In the interesting notes on apples for Long Island (page 403) I was surprised to find so few of the old standard varieties mentioned in Mr. Nostrand's list, also to see that out of the 24 named only five passed as desirable and one of them Ben Davis. That seems rough on the apples or the soil of Long Island. Here on the north shore the soil has produced for me some No. 1 fruit of Red Astrachan, King, Lady Sweet, Hubbardston, Rhode Island Greening, Spy, Newtown Pippin, Flory or Winter Banana, Peck's Pleasant, Roxbury Russet, Wealthy, Yellow Transparent, Dominie and a few other varieties and did the same in pears, plums and peaches, and that too at the time when the San José scale was getting in its fine work, and we had not struck just the right sure way to handle it. No, Long Island is all right for almost anything you want to do right.

JAMES HALLOWAY.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

HERE are some points from that New Jersey cow case which was reported last week. The cow belonged to Van Nest and she went over upon Dealaman's farm. Van Nest's lawyers argued that Dealaman made an agreement by telephone to keep up his share of the line fence—therefore he was responsible for what happened when the cow passed over the farm line. Dealaman's lawyers argued that if he had gone after the cow with gun, dog or club and injured her he would have been responsible for damage. As it was the hired man drove the cow off peacefully. Dealaman helped doctor the cow and also helped bury her. Before the Court of Errors Dealaman's counsel showed what might follow if the verdict should stand. Suppose a farm worth $4,000 and mortgaged for $2,000. A purebred cow worth $1,500 or more, as many are, breaks in, grazes on corn as Van Nest's cow did, and dies. Under the first verdict in this case the farmer would be forced to pay for the cow and thereby lose his farm and home. This would be manifestly unjust, yet it might easily have happened had this cow verdict not been reversed. It was a good thing that Dealaman carried the case to the highest court. A much better way is to keep out of court entirely and make an agreement to put up a strong line fence.

*

THERE is no reason now why every farm mortgage in the State of New York should not be written for a long term of years under the new farm credit law. Where local saving and loan associations now exist these will be able to handle the farm mortgage, or new associations may be formed if this is thought necessary. Where no association exists certainly one should be organized promptly. Each loan bank may take mortgages anywhere within 50 miles of its office. The mortgage may run 40 years. It cannot be called, but it may be paid in full or in part any time. If you have any money to invest or if you want money on mortgage the bank will serve you. Talk it up in your neighborhood; and the State will help you organize, and will supervise the bank to protect your interests. The rate of interest on the mortgages will depend on the rate at which land bank bonds will sell. These bonds will be such an attractive investment we expect the first issue to sell at par at four per cent. interest, and later issues for less. Take this up in the Grange and in the club. It means a safe and convenient investment for any money you have idle; and if you have a mortgage or want one, it means peace of mind and smaller interest payments.

*

A PENNSYLVANIA reader wrote Senator Boies Penrose, or rather "licked a stamp," asking the Senator to stand up for parcel post. He received a letter back so quick that it must have got the first train out of Washington. What do you suppose the Senator told him? Here is part of the letter:

> I have always advocated the building up of the parcel post system, and shall continue to urge the development of the same to its fullest extent for the convenience and benefit of the American people. I am not in favor of any legislation which will hamper or cripple in any way the Postmaster General in the administration and development of the parcel post system. My attitude in Congress in this connection is well known and is a matter of public record.

There are a good many farmers in Pennsylvania who have on file letters from Senator Penrose about parcel post, written two years ago. In those old days Mr. Penrose made very short work of this correspondence. He told the farmers that he would give the subject "careful consideration," and then apparently he forgot all about it. His attitude in Congress strikes us like that of a man who gave "careful consideration" until he saw that the people were absolutely determined to have parcel post, or not to have public servants who opposed it. At any rate, here we have a great sign of progress. It's a very happy step forward from "careful consideration" to such a position as Senator Penrose now takes. "But why did you wait, my brother?"

*

WE once saw four men trying to turn a locomotive on an old-fashioned turnstile. It was one of those circular holes with a revolving track. The engine ran upon this track, then the men pushed against a beam or handle and turned the track around. In the case mentioned the engine ran on the track and the men pushed. They strained and toiled, but they could not stir the weight. Half a dozen others came, but it was like trying to lift the dead weight of the engine. Then the engineer opened the valve and let in a little steam. The engine crawled two feet ahead and stopped. Then the four men without effort pushed the track around. One stout man could have done it. In the first place the engine was out of balance. Those men were forced to lift tons of useless weight. By moving two feet ahead the engine balanced its own weight and no lifting was needed. Last week we saw a man and a boy trying to haul a load of bags on a two-wheeled cart. They strained, but could hardly move it. The boy got on the back end of the load and the man walked off with it easily. The load had been adjusted so that a large share of the weight was carried by the workmen. When the boy got in behind the balance was restored and the man was not obliged to *carry* it. Now a good many coöperative societies are bound to have the same trouble unless all the members keep in their place and do their fair share of the work. Good organization gives each man his own work to do. That means "balance," the same as with the engine and the cart. Let some of these men neglect their share or go to doing some other part and the weight of the enterprise is thrown upon someone else. Cooperation means not only sharing profits but sharing the labor and care as well. It is give as well as take.

*

YOU may be interested to know I am getting from $9 to $12 a barrel for fancy Northern Spy and Wagener apples. These apples were all wrapped in the orchard the day they were picked, and have never been dumped from a basket. These prices make a man feel he has reached the highest mark, but I have thought so many times before, only to do a little better later. These Spies have been retailing all Winter for $1 a dozen. GEO. R. SCHAUBER.

We have several reasons for printing this. First, possibilities in selling fruit. There are in New York City alone at least 250,000 people who never stop to ask the price of anything which pleases the eye or taste. If it suits them, they want it regardless of price. Draw a line just west of Buffalo straight down until it strikes the ocean or gulf and you have more of these buyers than can be found in any other territory of equal size on earth. These fine products are perishable and cannot be safely sent far in small lots. Therefore, those who live inside this territory, or near it, have a superior market chance. A poor soil near a great market is worth more than a rich soil far removed. Another thing is the fact that no man touches these high and dainty markets until he puts the highest skill into his products. If these apples had been sent to a commission man last Fall they might perhaps have netted $2 a barrel. The extra $7 to $10 represent judgment and skill and nerve on the part of the growers. These are only two of many points about these high prices.

*

Why do you not do your duty and tell your readers that the San José scale is dying out so that there is no need of spraying? S. A. E.
Michigan.

This matter of duty seems to come very easily to some people—with us it is often hard to understand just what a public duty is. *"Let us hear the conclusion of the whole matter."* The fact seems to be that throughout parts of New England, New Jersey, Pennsylvania and to some extent New York the scale is losing something of its power to spread. This seems to be due to an increase of its natural enemies. The scale has been with us about long enough for the parasites and insects which feed upon it to become quite numerous. All know how certain insects, like the potato beetle, increase as potato growing spreads. In somewhat the same manner the parasites which live upon a certain insect will increase as that insect spreads and thus provides the special food for the parasites. This seems to be what is happening slowly to the scale. After some years it is quite likely that this scale will be brought to the economic conditions of some other insects once very destructive but now kept in check by their parasites. The same thing may finally happen to the potato beetle, yet suppose we reasoned from that hope that there is no use spraying to kill the beetles! We consider it our duty to tell our readers to keep right on spraying to kill the scale. We hope that the parasites will some day master it, but they have not done so yet. We shall keep right on spraying, though we have "planted" the parasites in the orchard. It is our duty to tell our friends what we are going to do ourselves. Spray!

*

WE never knew the time when more interest was taken in convenient water systems for the farmhouse. Men may come and men may go, each bringing some large "issue," but the greatest household problem will remain the same—bringing water to the house, letting it circulate freely with heat and cold, and then taking it out in a safe and sanitary manner. We want to make our readers see that the bathroom, the "septic tank" and the kitchen water rank with the silage cutter, the reaper and the farm engine in importance. The Agricultural Department at Washington has just issued a pamphlet on "Farm Water Systems," which is of far greater importance than any bulletins on the Mexican War. It will tell you just how to get water to the house, what to do with it when you get it there, and how to take it out. It is free, and you should send for it. We shall stand for this water question just as we do for Alfalfa, lime or coöperation.

*

OUR old friend E. G. Lewis had a full and complete vocabulary of guff, sarcasm and abuse. No one knew better than he how to induce a confiding person to part with his money, or how to turn on him when, later the poor thing found that he had been duped. THE R. N.-Y. went through it all, from oily guff to murderous sarcasm. Mr. Lewis thought he did a master stroke when he urged his soldiers to call THE R. N.-Y.

That 10-cent paper!

Lewis seemed to think that would end us. It did drive the other farm papers out of the trial term offer, but we kept right on. We think of Lewis on receiving the enclosed:

> We subscribed for THE R. N.-Y. for a period of "10 weeks for 10 cents," and although we do not harbor any ill-feeling toward you or your solicitor, we think you have taken an unfair advantage of us by filling the paper so chock full of good things that we cannot possibly get along without it; consequently we are enclosing you $1 for a renewal for one year.
> Wisconsin. C. E. PATTERSON.

We could show thousands of letters like this one, where a short visit has led to life-long friendship. Some of them put it in a forcible and pointed way:

"You have your toe in my door and you force your way in. I cannot help helping you to do so."
New Jersey. J. D. M.

Selling goods by sample is the fairest way of doing business, provided the samples are representative and uniform. THE R. N.-Y. spends no time telling a stranger or anyone else what it is going to do. We rather say to all: "We put all we have into each issue of THE R. N.-Y. Some issues will suit your personal tastes better than others, but a fair reading of 10 papers will show you whether the paper will help you or not. We will accept your judgment in the matter." The other papers have abandoned this plan of selling by fair sample. THE R. N.-Y. has found it an admirable plan for extending its circulation, for a very large proportion of these visiting friends become regular members of the family.

BREVITIES.

OH who can hope to pay the piper when—old boarder cows are kept by boarder men?

ONE way to get that heavy soil of yours into the limelight is to use lime. Lime will lighten it.

THE Japanese are shipping eggs to Hawaii. The "Business hen" covers the world, and hatches out trade in all the corners.

STRIKING the keynote. Many people do it, but most of them put on the soft pedal, and seem to be afraid that someone will really hear the note.

IN Bulletin 127 the Pennsylvania Experiment Station gives a thorough study of the limestone and lime supplies of that State. It is a very full and complete record of Pennsylvania lime.

A NEWSPAPER report from Isabella de Sagua, March 30, states that Boatswain Lunemberg of the steamer Borney Castle fell from the bridge of the vessel into the harbor that day and was devoured by sharks before a rescuing boat could be lowered. Last year THE R. N.-Y. was informed, by a government official that sharks did not attack human beings, but several of our readers came forward with dissenting opinions.

THE NEW MARKET SYSTEM.

The new law creating a State Department of Foods and Markets is one of the most helpful pieces of legislation that we have adopted in the present generation. There is, however, no magic in a law. To permit a thing to be done is not to do it. The law will not operate itself. If the work should fall into perfunctory hands the Department would be useless. It is a work that must be pursued with vigor, perserverence and determination. It will not move along like the traditional sweet song. Every effort, every allurement and every device known to experienced manipulators will be employed to discredit the work and to defeat its purpose. Strength, cunning and experience will be combined against it. The interests opposed to it will be fighting for a privilege that they inherited, and for their own existence. There will yet be room in the produce trade for honest men and honest business; but there will be no place for the band of pirates who have dominated the trade for the last generation.

Against a few hundred speculators in foods we have the whole producing and consuming population of the State. We must select one man to lead these people. This leader must be a man of vision, of enthusiasm and executive ability. He must embrace the whole State within his horizon. He must start the food from the fields of farms to the tables of the consumers in a steady unobstructed stream, and if any man, or set of men, attempt to obstruct the channel or to deflect the traffic, he must not only prevent the obstruction or deflection, but he must strike down the hand that is raised against his work.

We may just as well understand the task before us now as at any other time. We are about to throw over a system that has been ideal for middlemen and disastrous to producers; and establish in its place a system that ought to be ideal for producers and disastrous to crooked commission men and food speculators. The farmer has been producing food for a living. The consumer has been paying to the limit of his ability. The middlemen have reaped the profits, and perpetuated extravagance and waste. For every dollar the consumer paid, the distributor got 65 cents. The producer got 35 cents. We are going to change this. We propose to give the consumer more for his dollar, and give the farmer more for his produce. The middleman must be content with much less for his services. Does anyone expect the middleman to surrender his 65 per cent. without a fight? We expect nothing of the kind. We look for a most interesting scrap. The end will not come all at once; but when the scrap is over the produce men, as we have known them in this generation, will be no more. In their place will be merchants handling food products on a fair profit, and doing a legitimate service. No others will be able to stand the test of inspection and the competition of the open State controlled market.

Our commissioner must establish grades and standards and packages and labels. He must develop local markets throughout the State, keep producers advised as to domestic and foreign markets, and publish prices established by auction markets. We have a salary of $6,000 for the place; and we want a $50,000 man to fill it. There will be lots of $1,000 men looking for the $6,000 job; but no $50,000 man will seek it. If we get him, we must seek him. The man with vision enough to see the great possibilities of the work will be big enough to sacrifice personal interests for the sake of the single service he can render both the present and future generations.

FINANCING SOUTHERN COTTON PLANTERS.

PART II.

Plowing begins in March. The planter must have food for himself and his family, and feed for his mule. He must have seed and fertilizers. He gets the first installment when the contract is signed with the "factor" in the early part of March. You then see the planter wending his way home, the wagon loaded with his purchases. It is doubtful if much of the money ever finds its way outside of the city limits.

The greatest hardship in this system to the planter is not so much the high rate of interest as in the fact that the crop is sold before it is planted, and eaten so to speak before it is gathered. No matter what the price, it must be delivered when picked; and it does not require much imagination to see that the price will generally be lowest when deliveries are being made by producers, and highest after the crop has left the growers' hands. Besides cotton varies greatly in quality. There are in all probably as many as 30 different grades as a result of growing, picking and caring for it. The price varies with the grade, and if the "factor" is inclined to make the most of the situation he finds an opportunity in fixing the grade and corresponding price. Whether the "factor" is unscrupulous, fair or altruistic, depends on the individual, but I doubt if a system could be devised to put him more completely in control of the situation.

I do not write to criticise Southern people or Southern customs. The Southern man may find as much to criticise in us as we do in them. The Southern people are courteous, hospitable, generous and chivalrous. I found the "factors" courteous and I have no doubt that their sympathy with the grower in his position is genuine, and at times leads him to unusual risks. The factor and the planter understand each other better than a stranger can understand either of them. I write not in the spirit of criticism, but in the hope of making a suggestion that may yet be found helpful. The trouble is not with the men, but with the system. The Southern farmer gives himself up too exclusively to the growing of cotton. The system is partly responsible for this. As we have seen, his mule and his chattels generally are pledged in advance for a cotton crop. To default in payment is the same to him as it would be with a banker or a manufacturer. He is in a system that makes and preserves records. Let him default once and his standing and credit ars gone. He must produce cotton to meet the debt. But the Southern farmer of the future will diversify his work. Today the Georgia farmer buys Alfalfa from New Mexico, fruit from South America, vegetables from Florida, pears from California, and apples from New York and Oregon. He goes to Missouri for his mules, to Minnesota for his flour and to Wisconsin for his butter. Many of these products, and good substitutes for all of them, can be grown on the farms of the State. A banker with a large and valuable farm told me he could not raise oats and corn to sell at a profit. He admitted cow peas and vetch grow luxuriantly and of course, make an excellent hay for milch cows. I asked him why he did not go into the dairy business. He said there was no dairying in his section except to supply liquid milk. The butter came from the North. I told him how a coöperative creamery might be built for $2,000; and butter supplied to all local trade from neighboring farms. He listened with great interest, but finally said: "Yes, but that requires organization." The air was enough to say that makes it impossible there. It required organization to establish his bank, and to erect a large number of cotton mills in the town, and to build a two million dollar power plant. It is never difficult to find men ready to organize capital where there is a promise of rich reward. With organized producers the profits are widely distributed and consequently the work is not so attractive to the genius of organization. Coöperative organization is as essential to the farmers of the South as it is to farmers everywhere else. It will not come all at once. It had better not. A slow growth is better for permanent results. Probably twenty million dollars worth of cotton is delivered to the Augusta market. For the most part the growers get a meagre living out of it. If these growers were united in coöperative organizations to furnish their own credit, buy their own supplies, and market their own product, they would save for themselves not less than five million dollars annually; and would probably be the most prosperous farmers on the face of the earth.

J. J. D.

KANSAS WEIGHTS AND MEASURES.

THE Weights and Measures Law, administered by the State Board of Health, states that unless there is a special written contract to the contrary, feeds made from the common cereals must be packed 100 pounds gross. The consumer can find protection under this law if, when he orders a sack of corn chop, for example, he discovers the package delivered to him weighs only 98 or 97 pounds, or even a less amount, gross.

This comes from the Kansas Agricultural College, and refers to the Kansas law. In the East we have been led to believe that Kansas is such a rich and fat State that laws to protect grain buyers would not be needed. Yet it seems that some Kansas dealers are giving "short weight" and systematically robbing buyers of 20 to 30 pounds out of each ton. Buyers acquired the habit of buying grain by the "sack" instead of by the pound, and the sack seems to have been steadily shrinking. Much the same thing is true all over the country. If it pays to weigh the milk and find the robber cows, it pays to weigh the feed and find the robber sacks. In old times soldiers used to "sack" a conquered city. Do not let the feed dealers try it on your pocketbook.

CO-OPERATION IN EGYPT.

EVEN Egypt has started agricultural coöperation, backed by the law. Consul Garrels of Alexandria states that the new Egyptian law contains the following:

They must consist of a minimum of 10 members, all agriculturists, agricultural workmen, land owners, or tenants of rural estates belonging to the same or neighboring vilayets. The sole objects of these societies are as follows: The purchase in common of animals, machines, and other agricultural things, the procuring of all agricultural implements and machines, the sale for the members' account of the crops and agricultural produce, the loaning to members only in money or kind, such loans being destined for useful expenditure and authorized by the statutes, the receipt of deposits of moneys from members according to the prescriptions of the statutes, and the undertaking of agricultural works for the good of the societies.

It was 115 years ago that Napoleon at the battle of the Pyramids exclaimed: "Soldiers, from yonder Pyramids 40 centuries look down upon you." This impassive view has now been extended for another century. They have looked upon scenes of slaughter and still more pitiful slavery—countless millions of human beings driven like dumb brutes at labor for others until the manhood was crushed out of them. In all that time they have looked upon no brighter or more hopeful aspect of human life than now, when these descendants of hopeless slaves have come up to the dignity of coöperative work! For everywhere coöperation means freedom along the road to brotherhood, and think of New York behind Egypt in coöperative laws!

NEW YORK STATE NEWS.

THE HOG SPECIAL.—A "hog special" has been run through western New York recently, during a period of 10 days, by the New York Central Railroad, under the auspices of the State Department of Agriculture. Lectures were given on board the train by experts on the swine industry and pork production. One said that there were 8,000 less hogs in the State now than a year ago. The price has increased $1.25 per head on the average. Lack of attention paid to breeding and the ravages of the hog cholera are given as the causes for the falling off in numbers. A few animals were on exhibition in one of the cars which were taken from private pens because of the fact that when selection was made at the Buffalo stock yards so many were afflicted with the cholera that none could be found of such quality as were needed for exhibition.

TROLLEY LINES CO-OPERATE.—According to a recent newspaper statement the New York Electric Railway Association is to put forth a strong effort to develop the inter-urban and suburban sections of the State traversed by the trolley lines, by inducing new settlers to locate there and to establish experiment farms along their lines and in various ways to bring the farming districts into more intimate relation to the urban districts as a means to better social conditions and improve market facilities. From the 500 rural communities that the inter-urban railways of the State now connect by 1,500 miles of track with the great metropolitan markets, every effort will be made for quick and reasonable shipment of farm produce.

A GOOD TEXT.—Commissioner Huson took a good text for a talk before the Dutchess County Farm Bureau and other farmers at Poughkeepsie last week. He said: "Don't compete with your neighbor; coöperate with him." Continuing, he said: "A community of farmers all engaged in producing the same special article is bound to attract attention to the locality. In trade there is a tendency to get together and farmers should do the same. Millbrook is famous for its Shropshire sheep, so every farmer who keeps sheep at all should keep Shropshires in central Dutchess. In Ontario they are doing that with the Hampshires with the result that buyers go there when they want Hampshires." In Yates county Mr. Huson popularized the raising of pigs. He said that some of his neighbors wanted to breed a different kind of pigs when they see he was raising about 400 head of one breed every year. But he advised them to raise the same as he did.

SMALL FARMS NOT PROFITABLE.—Prof. K. C. Livermore of the farm management department of Cornell discussed the subject in which he is specially interested at a meeting of farmers at South Byron last week. He referred to a survey of farms in Jefferson, Tompkins and Livingston counties, 578 farms reporting. Actual visits had been made to all of these farms during a period of several years in order to get the figures as nearly accurate as possible. It was shown that on the farms of less than 50 acres almost universally the farmers' sons had gone to the town or city to work, while on the large farms they had remained. It was also found that on these small farms the labor income, or what remains to the farmer after paying expenses, was less than nothing and it would have paid the farmer to have gone to work for some one else as hired man. The larger farms made a much better showing.

MANUAL OF CO-OPERATION.—The Department of Agriculture has recently issued Circular 94, a manual of coöperation. It is a very helpful piece of information on matters pertaining to coöperation among farmers. Marc W. Cole writes, "A Primer of Cooperation," in which he condenses in three pages a vast amount of information. J. C. Bellingham of Schenectady describes "The Citizens' Coöperative Supply Company" of that city, which has a membership of over 200. L. C. Tuckerman gives an account of the wonderfully successful fruit growers' association of the Hudson River Valley with headquarters at Milton. The second year of its organization the association did a business of $232,000 on a capital of $1,200. It has 84 members. Members of the American Commission tell how to adapt European systems of coöperation to this country. Emerson P. Harris describes a trial of an English plan in Montclair, N. J. The Montclair Coöperative Society started in 1912 with about 300 members. Their store is doing a business of $10,000 a month and saving members from five to eight per cent. The cost of doing business there has been reduced to 13 per cent. on retail price, including 3 per cent. for delivery

J. W. D.

Direct Dealing With Farmers.

I was quite interested in the story in a late R. N.-Y. of the cost of a barrel of apples, bought within 100 miles of New York City, for which the purchaser paid $1.50, and which cost him $1.67 carrying charges delivered at his home in the city. I have been wondering how he worked it to have such a charge. How far away from any recognized public carrier were they when he bought them, or did he send a private messenger for them?

My own experience is quite different. I bought a barrel of Northern Spys in Orange County last Fall, and they were delivered at my house in Brooklyn by the Wells-Fargo Express Company for 60 cents. The farmer received $2.50 of the $3.10 it cost me; that is, he had 80 cents of each dollar I paid. My farmer friends 75 miles from the city have been getting from 40 to 48 cents per dozen for eggs ever since the early Fall. I use about 1½ dozen a week. I buy them for 35 to 40 cents per dozen, and I have not had a poor one this Winter. Of course they are not the same eggs, but those I get from my grocer are good ones. I don't see how a 35-cent dollar is figured from that.

I bought my Winter supply of potatoes from one of my farmer friends referred to above. They cost me when safely in the cellar, freight and cartage paid, $1.01 per bushel. The farmer got 75 cents of each dollar I paid, and the railroad and the cartman divided the other 25 between them. I look at this thing from the consumer's side. I don't mean to pay a dollar for anything for which the producer gets only 35 cents. I wish the carrier and the distributor to get fair pay for their services, but not an unfair part of the price I pay.

J. J. W.

Brooklyn, N. Y.

Woman and the Home

From Day to Day

THE LOT OF THOUSANDS.

When hope lies dead within the heart,
  By secret sorrow long concealed,
We shrink lest looks or words impart
  What may not be revealed.

'Tis hard to smile when one would weep
  To speak when one would silent be;
To wake when one would wish to sleep,
  And wake to agony.

Yet such the lot for thousands cast
  Who wander in this world of care,
And bend beneath the bitter blast,
  To save them from despair.

Yet nature waits her guests to greet
  Where disappointment can not come.
And time leads with unerring feet
  The weary wanderer home.

—Anne Hunter (1742-1821).

*

THE equal suffragists in this city, who have been holding an elaborate fair recently, included a number of baking contests in the attraction. Quite naturally they challenged some of the anti-suffragists to enter these competitions, which would seem especially suited to those whose slogan is "Woman's place is in the home!" But, to the public surprise, the antis declined to compete, and the tempting fresh bread, the fragrant pies and cookies, were the work of "votes for women" enthusiasts. As one of the prize-winners was a woman who has often been prominent in suffrage "hikes," it would not appear as though she had lost her place in the home by occasionally marching out of it.

*

AT the recent New York flower show there was a little display of garden aprons, children's dresses and other garments, made by "The V. & R. Industries." This is a philanthropic agency for the benefit of convalescents discharged as cured from the Vanderbilt Clinic and Roosevelt Hospital. There are many cases where patients, while recovered from an illness or operation, are entirely too weak to go back to their regular work, and yet in sore straits for means of support. It is to tide them over this period that the "V. & R. Industries" were established by a group of philanthropic women. At present they are only handling women's work, but they are looking about for suitable men's handicrafts also, and have hopes of utilizing some lines of cement work for them. Among other things in this display were garden pillows, covered with enameled cloth, and stuffed with cork shavings—a great convenience for amateur gardeners, when kneeling on damp earth in their garden operations.

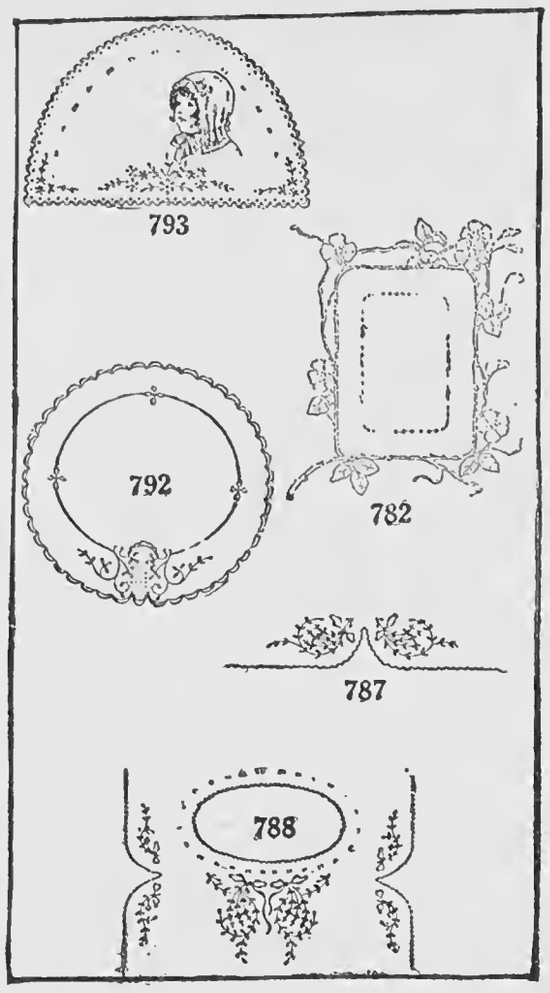
*

SINCE few farm housekeepers have the opportunity of securing coöperative help in laundry work, the next best thing is to simplify their needs in this direction, so far as comfort and cleanliness allow. We have referred, many times, to the use of seersucker or ripplette in lessening ironing, both for children's clothes and women's house dresses, while the cotton crapes have a useful place for nightgowns and other underwear. Knit union suits, as well as separate garments, in all the Summer styles, are another help. The present styles of little girls' frocks are largely made with bloomers for "underneaths" and this saves much ironing of little petticoats. But we wish every home laundry could be equipped with a mangle, household size, which would iron all the flat pieces quickly and well and which could be run by the gasoline engine. Unfortunately the gasoline engine has not yet been taught to hang clothes on the line, but the housekeeper can save herself much exposure in cold weather, or when it is damp underfoot, by having a trolley line rigged from the back porch, like the network of lines stretched over city backyards which may be viewed from THE R. N.-Y.'s office windows every day.

The Rural Patterns.

The prices quoted are for stamped goods and material for working but transfer patterns of any design will be furnished separately for 10 cents each.

No. 793.—A design for embroidering a one-piece child's cap. Stamped on pure Irish white linen with mercerized floss to work, 30 cents.

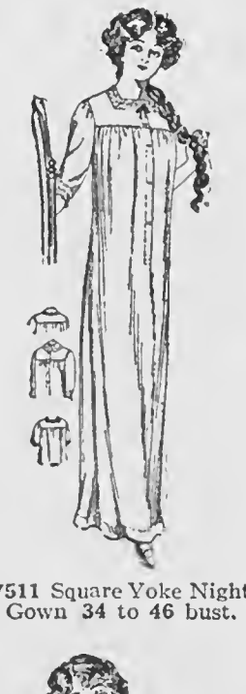


No. 792.—A design for embroidering a doyley six inches in diameter, six transfers are given. Stamped on best white Scotch linen with mercerized floss to work, 15 cents. Set of six, 80 cents.

No. 782.—A design for embroidering a photograph frame in wild rose design. Stamped and tinted on gray linene with mercerized floss to work, 20 cents.

No. 787.—A design for embroidering frills for women's and misses' drawers. Two transfers are given.

No. 788.—A design for embroidering a low neck nightgown with short sleeves. Stamped on best quality of nainsook with mercerized floss to work, $1.25.



7511 Square Yoke Night Gown 34 to 46 bust.

7839 House Gown or Nurse's Costume, 34 to 46 bust.

8206 Tunic Dress for Misses and Small Women, 16 and 18 years.

8213 Girl's Dress, 10 to 14 years.

8221 Child's Empire Dress, 1, 2 and 4 years.

8125 Child's Dress, 6 mos. or 1 year and 2 years.

Keeps
SINKS SNOWY WHITE

"OLD DUTCH" cleans the sink "as quick as a wink." Quickly banishes grease, dirt and stains from porcelain, enamel and metal parts. Equally effective for scrubbing wooden sink boards.

Home-canned Meat.

Can you give me a recipe for canning meats, such as veal, in glass cans, so it will keep through the Summer?

H. W. S.

The following recipes are from the "Rural Cook Book." They were contributed by housekeepers who found these methods very satisfactory.

Half cook the meat in a kettle, cut meat from the bones. If this is done while the meat is hot, wring out a cloth from cold or tepid water, fold in several thicknesses, and set under the glass can, letting cloth come up about an inch around sides of can, and it will not break, no matter how hot the meat may be. If you spill more broth on the cloth be sure to wring out extra water from it, for if the cloth is sopping wet, the can will break. Having filled can with meat, pour in all the broth the can will hold, and see that it is salted and peppered just right for the table. Screw on cover without rubber and, if hot put in kettle partly filled with hot water, putting a tin in bottom of kettle to set cans on. Three quarts can be put in common-sized kettle. Cover with a well-fitting cover that will keep in the steam, and keep boiling for two hours. Take out one can at a time, and at once put on a good rubber. If you want to keep the meat for several months, if it is chicken, veal or beef, have hot melted beef suet and fill the cans even full. If you only care to keep the meat for two or three weeks fill up even full with boiling broth. This work must be done with dispatch, not letting the contents of the can cool in the least. Screw on the cover to the last limit, and if your covers and rubbers are not defective your meat will keep perfectly. In canning pork there is nearly always sufficient grease to broth; if not the can may be filled with lard.

Canning Meat in Tins.—Trim off all surplus tallow from meat, and either boil or roast the beef, using but little salt and pepper, preferably none at all, as these will attack the tin; meat can be spiced, etc., when removed from can to serve. When cooked remove from liquid and trim off from bones. If liquid is too greasy let it get cold and then remove tallow. While again heating liquid and meat boiling hot get the cans and covers ready, the covers to be pierced by an awl in the center. Use the friction top tin can only, for keeping meat through the Summer and dog days. You can use glass jars to keep same till May, but they are risky during warm weather. When meat and liquid are hot pack meat into the cans—any size you wish—not quite full, and pour liquid over, same so as to cover meat somewhat, then place on the covers good and tight. Put cans into oven and bake one or two hours. If cans are too full, liquid will ooze through vent. The baking will drive out every particle or atom of air through vent, and is absolutely necessary for safety. When nearly done baking liquefy some paraffin or sealing wax, and heat a soldering iron. The paraffin is to seal cover airtight around edge, and the soldering iron to use with solder to close up vent opening in center. Take out of oven a can at a time and solder vent opening as quickly as possible, then paraffin the edge of cover. Place cans—after finishing job—where it is dry and cool. A steer can be packed into about 50 or 60 quart cans.

Honey and Its Use.

There is $20,000,000 worth of honey produced in the United States annually. The greatest part of this honey is used by the large baking concerns. Honey is used in varying quantities in cakes and cookies. Sugar cakes and cookies, also those made with molasses, soon become so dry that they are not palatable. But honey cakes will keep in good condition almost indefinitely. Indeed they seem to improve with age. In many homes honey is a luxury. Honey is food in its most concentrated form, and should not be considered a luxury, as a pound of honey costs no more than a pound of good candy, and is much better for the children. Bread, butter and honey is not as expensive article of diet as pies and cakes that often make up the school luncheon. Can any housewife make a complex mixture that is more delicious than wholesome bread, good butter and honey, to say nothing of digestibility? We have substituted honey for molasses in cakes and cookies that call for sour milk and soda with good results. This gives variety, the cakes are better and one can bake in larger quantities as they do not become dry and hard. Honey used in making puddings gives a delightful flavor.

A cup of strained honey to a quart of cream makes a delicious ice cream. Honey can be made into candy with the addition of sugar. Plain honey candy is made by standing a vessel with one pound of honey, one pound sugar and one tablespoonful of water in another vessel of hot water until sugar melts and then cooking over a moderate fire until it forms a ball; turn into buttered pan, flavor with lemon and pull when cold.

Nut Honey.—Make a plain candy as above, and stir in nuts when taken from fire, place in buttered pan and cut into squares.

Honey Cream.—Take an equal quantity of honey and cream, stir into this mixture powdered sugar to make stiff and then knead like bread and form into fancy shapes. Use half honey instead of all sugar when making fudge and you will be pleased with the results.

Honey Delights.—Cook one cup of honey, one cup sugar and one cup sour cream until thick. When cold make into balls and place half an English walnut on each.

Honey can be used to sweeten lemonade or fruit punch when something extra fine or novel is wanted. Both raw and cooked fruit sweetened with honey is considered a great delicacy in many homes. Raw peaches and cream with honey are especially nice.

Comb honey kept for Winter use, should be kept in a warm place, as honey cells will grain and comb honey thus candied is not palatable. Extracted honey can often be liquefied by placing in a warm room for a few days, or the vessel of honey can be placed in another vessel of hot water. Honey should not be heated directly on the stove, as it is likely to impair its delicate flavor.

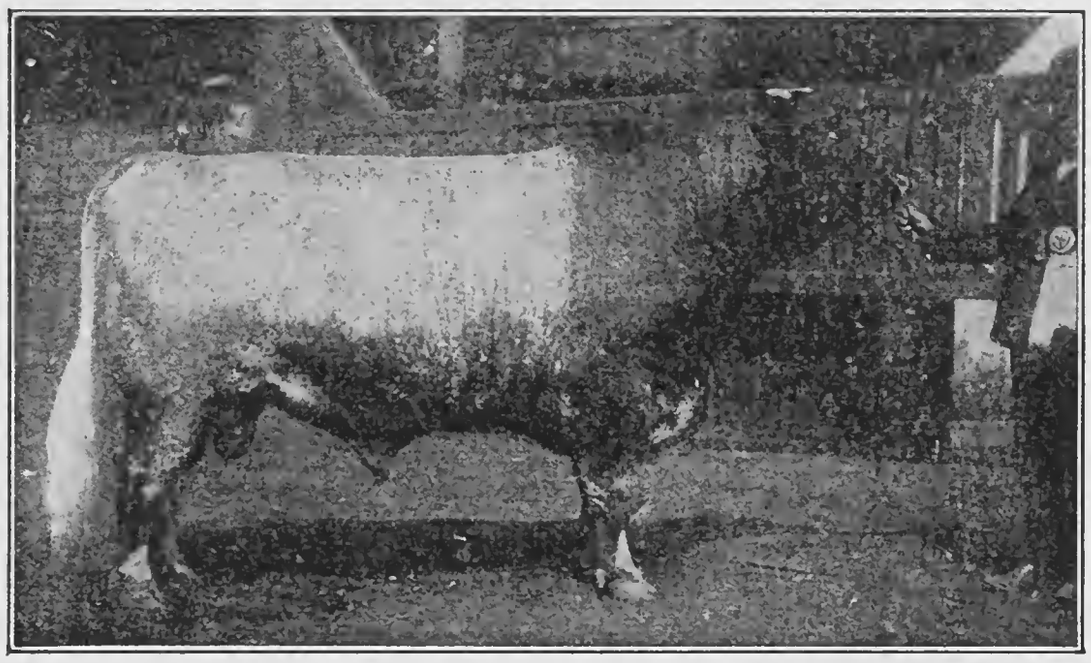
Live Stock and Dairy

SOME SHORT-HORN RECORDS.

A few years ago I was asked to furnish a paper for one of our local farmers' institutes, and I read one setting forth the merits of the Short-horn cow as a milker. After citing several remarkably good records I concluded with the statement that the dual-purpose cow was no longer a delusion as was claimed by some, but was here in the flesh and had come to stay. A part of the institute's force were strong dairy breed advocates, and they roasted me at every available opportunity during the remainder of the session. But



A GOOD SPECIMEN OF SHORTHORN BULL FROM THE MIDDLE WEST.

I have lived to see my prophecy abundantly fulfilled, for I have seen an American-bred Short-horn cow that has made 18,075 pounds of milk, 735 pounds of butter, in one year, under official test, and average daily production of 495 pounds of milk and two pounds of butter for the entire year. There are quite a number that have exceeded the 15,000 pound mark in one year, a countless number that have exceeded the 10,000 pound mark and many more in sight that are coming.

They have been taken up by the leading agricultural colleges of this country. At the Missouri college they have the cow Lula, with a milk record of 12,341 pounds and 615 pounds butter, and Panama Lady, 13,789 pounds milk, 572 of butter. Pansy of Stanton at the Michigan Agricultural College produced 10,058 pounds milk, 456.5 pounds of butter, in one year and during that time gained 324 pounds in weight. At the Iowa State College, College Miore produced 517 pounds butter in the year. Florence Airdrie, owned by the Nebraska College gave 10,436 pounds milk, 494 pounds butter. The New York State College of Agriculture has two remarkably good young cows in the Short-horn division of their dairy herd. Lady Clay 3d has a record as a four-year-old of 11,488 pounds milk, 558 pounds butter, in one year; Lady Clay 2d, at three years gave 8,540 pounds milk, 384 pounds of butter. The Glenside Herds report for 1913, 85 cows with records of 8,000 pounds or more and 34 better than 10,000, with Eldora Clay's 15,000 record. At the London Dairy Show last year, Sherwood Rose won first prize in a two-day test with 144 pounds milk testing 4.08 per cent. fat. Ruby won second prize with 115.5 pounds milk testing 5.6 per cent. of fat. R. W. Hobbs & Son of Gloucestershire report an average milk production of 6,400 pounds from their dairy of 200 milking Short-horns. But the best record of all is that of Model Maid, owned by Mr. James Shippy of England, that gave, from September 1, 1912, to August 31, 1913, 22,348 pounds milk, a record that will make some of the Holstein cow owners sit up and take notice. A. H. PRINCE.

Schuyler Co., N. Y.

Training a Saddle Horse.

I read the inquiry upon the training of a saddle horse from B. D. and your query concerning the same. I have been in the West for many years, and most of my business was carried on while in the saddle. From experience I would say that it would be impossible to train the horse in question to be good both as a saddle and single driving horse. A good saddle horse should not be allowed to carry a harness, as this tends to make them "heavy" in their gaits, and as a heavy-gaited horse is very tiresome to ride it should be avoided. In breaking this animal I should put a saddle upon her and turn her loose for two or three hours a day. Handle her considerably during a few days. Then when I did get in the saddle I would let her have her own way as much as possible. Avoid bringing her up short, as this will tend to make her nervous in future handling for the required gaits, and also tends to make her afraid of the bit, which is bad in a saddle horse. After she had quieted down and learned not to be afraid of you, I would try her in all her natural gaits until I found that which was the easiest for both the rider and horse. Then I would hold her to that gait as much as possible. The principle thing is patience. Do not give up and let her walk home, as she will forget. Teaching a horse new gaits is like teaching an old dog new tricks. Unless you gait your mare from some natural gait of her own you will probably have an ungaited mare. I do not know that this will help you in answering the questions of B. D., but I sure would like to have the mare myself to break, as she is about the right weight for a good saddle pony. W. L. SHORT.

SALE OF HOLSTEINS.

Establishing a new record for the average price a head, the Breeders Consignment Sale Company, concluded its sale of Holstein-Friesians at the Liverpool, N. Y., Pavilion with $90,335 in the treasury for 180 head. This is an average of $502 for each animal. Young animals sold as high as $1,000 and the banner price of the day was $4,150 for Johanna King Segis, offered by John Arfmann, of Middletown, N. Y., and purchased by Houslett & McNutt, of Oxford, Wis. An interesting feature of the day was the sale of three daughters of King of the Pontiacs by Stevens Bros. Co. Below are some of the more important sales:

Johanna King Segis, Houslett & McNutt, Oxford, Wis., $4,150; K. P. Lilith Boon, Chas. C. Disbrow, Norwalk, Conn., $3,200; K. P. Lilith Clothilde, T. E. Gotselman, Hampshire, Ill., $2,900; K. P. Daisy Copia, Oakhurst Farms, Gloversville, N. Y., $2,550; Fairmont Netherland Posch, R. E. Davis, Mexico, N. Y., $2,000; K. P. Lilith Lady Clothilde, T. E. Gotselman, Hampshire, Ill., $2,000; King Pontiac Beryl Korndyke, E. L. Pohl, Watertown, N. Y., $2,000; Zozo Pontiac Hengerveld, John Arfmann, Middletown, N. Y., $1,700; K. P. Mutual Pietertje, Oliver Cabana, Jr., Buffalo, N. Y., $1,525; Fiuderho Wayne Pontiac, Stevens Bros., Liverpool, N. Y., $1,410; King Segis Alcarta Clothilde, Morgan Bros., Chesterton, Ind., $1,300; Female Calf, H. C. Danks, Allemuchy, N. J., $1,305; King Pontiac Lad, Frank W. Adams, Chester, Vt., $1,200; K. P. Frindaella, John Arfmann, Middletown, N. Y., $1,200; Cornucopia Mae De Kol, Elmer Grimes, Alliance, O., $1,125; K. P. Mona De Kol Johanna, C. R. Moore, Garland, Pa., $1,020; K. P. Jeck Queen, W. G. Sterling, Frankford, N. Y., $1,025; Brookside Pinoocr Ormsby 2d, C. S. Fairchilds, Cazenovia, N. Y., $1,010; Contest Homestead Cornucopia, W. W. Chapin, Rochester, N. Y., $1,000; K. S. P. Soldene, Leon More, Lacona, N. Y., $1,000; K. P. Jacoba, Elmer Grimes, Alliance, O., $1,000; Pearl Macco, Henry Stevens, Lacona, N. Y., $960; Buttercip De Kol Netherland, A. P. Rogers, Danvers, Mass., $825; K. P. Elinda, T. E. Gotselman, Hampshire, Ill., $930; Pansy Veeman Hengerveld, Stevens Bros., Liverpool, N. Y., $810; Lulu Hengerveld Burke, Bernard Moyer, Finderne, N. J., $760; Lady Victoria Hengerveld Burke, E. A. Vandervort, Sidney, N. Y., $775; Alkamar Pledge Calamity De Kol, R. E. Davis, Mexico, N. Y., $700.

THE NEW ENGLAND MILK SITUATION.

There is some difference of opinion as regards satisfaction of price paid for milk the past Winter. Some are satisfied it was as good on the average as we could expect under present conditions; that is, general conditions all over field among the consumers, railroad transportation, and among the producer. The organization question, while moving at a good pace along satisfactory lines, has not yet reached that point where it could carry on a strong campaign of aggression to force the buyer to pay all we think is our due, or rather to make the production of tbis necessary product as profitable as some other lines in our business.

The New Hampshire producers as a general rule have a fairly well satisfied feeling, to a greater extent than Massachusette dairymen. Under present condition, and transportation charges that do not average up as they should according to distance the product is hauled, the short distance shipper has to pay more, or as much as some of the long distance shippers who are of course out of State, and thus we help support the others with something that should go into our own pocket. It is perhaps a hard matter to adjust the charges to fit all cases, yet there is much room for improvement, and to go at the matter in a bull-headed way sometimes results in raising charges to a higher level all along the line, without proper adjustment in extreme and unfair cases. It is much better to arbitrate this matter in a friendly way if possible and when not possible get a straight show of force behind you and with proper arrangement, this can be obtained.

The directors of the N. E. M. P. A. have been careful in not asking a prohibitive price for Summer milk to give the contractors no chance to put up a big howl as to how conditions will not stand it, etc., but have asked an advance of about two cents per can over last year's Summer prices. There is a strong feeling for having the price made yearly instead of every six months, and many were in favor of adopting this course at this price-making time. The way has been opened for this, or rather a start has been made by some small buyers both in Boston and outside, making this agreement last Fall. It is only a question of time when this method must be accepted by all, but of course the big fellows will put many obstacles and objections in the way, and hold the matter off as long as possible.

It is understood that some of the contractors have admitted that the price asked for the Summer is reasonable and think it should be paid. The producers have put a strong card forward in asking that in case of failure to agreement between buyers and producers the matter of price be left to the Boston Chamber of Commerce, their decision to be final. The hold-out contractors may not agree to this plan, because they know the producer has the sympathy and good will of this body, who have for some time had their committee on agriculture at work on the question pertaining to milk transportation and other matters of interest to producers in general The contractors also know, while they would get a square deal at their hands they would get no favors and these are what they often manage to work in somewhere while the other fellow is not looking. General conditions existing in the cities do not look favorable for a greater demand or consumption of milk at present, or in the near future, and we think for this reason and also the fact that a plentiful supply is being received and some going into butter, which is lower than for some time past, that a settlement on the terms asked for Summer milk should be satisfactory to a large majority of producers. There are of course always some who would want more, and demand more than it would be possible for the contractor to pay and conduct a profitable business or make a profit. The contractor has his troubles, and they are many and not the least of these is bad debts, yet he must pay for the milk received from producers, and in most cases is perfectly able and willing to do so. We must appreciate the fact, however, he has his rights as we have ours and be willing to work with him whenever possible, and adjust all the problems between us in a fair and satisfactory manner to both. Many times in the past some of the contractors have not shown a spirit of this kind we must admit, but they know in most cases that the time has gone by to a large extent for that attitude, and that it will be the best policy for them to try to be more fair in their offers and dealings with us. This has not been brought about through love altogether, but because it is and will be a much better policy, as the producer is gaining friends in the consumers' ranks and should a thorough understanding be obtained and practiced between the sensible consumer and the reasonable producer the contractor would be left out in the cold, or forced to be a servant to these, instead of boss of both. A. E. P.

Horses $150 to $275; cows (dairy) from $60 to $125; culls and canners $20 to $30 per head. Fat cattle from $6.25 to $9 per cwt.; hogs, fat, $7.50 to $9; brood sows from $30 to $40 per head. Sheep at sales from $6 to $6.75 per head; veal calves 10 cents per pound. Pigs from 40 to 60 pounds, 10 cents per pound. Wheat 87; oats 30; rye 70; barley 55; corn 63. Timothy seed $2 to $2.50 per bushel; clover seed $6 to $7 per bushel; Alfalfa seed $7 to $8. Milk $1.70 per hundred; butter 24; eggs 15; at present market unsettled owing to free trade. Cabbage four cents per pound. Potatoes $1; apples, Ben Davis, $1.50; Baldwins $2. Hay $8 to $12 per ton. Prices on grains are prices paid the farmer by elevator men; on produce, by local storekeepers. G. C. H.

East Liberty, O.

During March farmers could not get into the woods much on account of the deep snow. Schools had to close in rural districts for several days or weeks. Roads were quite impassable for a time. While the sleighing lasted, farmers hauled feed, fertilizer, lime, potatoes, hay, etc., making good use of the sleighing. Washington potatoes for seed have been 70 cents, eating potatoes 60; eggs 20; butter 27 at local markets. Dairymen not satisfied with milk prices for Summer months. V. S. C.

Elk Creek, N. Y.

We have had quite a Winter here, but hope it is over now. Stock is looking very well; wheat does not look very good. Good milch cows sell at from $65 to $90; country butter 28; milk six cents per quart. Horses $100 to $225; fat cattle six to eight cents and scarce. Hogs, fat, seven and eight cents; pigs $6 a pair. Eggs 16; good hay from $12 to $15; straw $7.50; wheat 98; corn 75. Potatoes $1 per bushel; apples seven cents per pound. There has not been much plowing done here yet. R. G. C.

East Fultonham, O.

Purebred Registered
HOLSTEIN CATTLE
Large sums are put into land, buildings, horses, machinery and labor in order to maintain cows that are utterly unable to return a profit.
On a dairy farm the efficiency of the herd should be the first consideration. With good purebred Holsteins you are sure to earn a generous profit on any intelligent investment of your money, time and labor.
After the cost of her feed is deducted a good Holstein will return a profit of $60 to $100 per year in addition to a valuable calf.

Silo for Small Herd.

1. Do you think it would pay me to build a silo for about 12 head of cattle? I can raise as good corn, I believe, as anyone in Western New York. I can raise Alfalfa on part of my farm, but it is very expensive getting it started. 2. I bought a sow in Atlanta, N. Y., which I wished to ship to Springwater, N. Y., a distance of about 10 miles. I asked the Atlanta railroad agent what it would cost to ship her to Springwater. He told me 10 cents per 100 pounds by freight. I had her shipped and it cost me 30 cents per 100 pounds; she weighed 500 pounds crated, so it cost me $1.50 to get her 10 miles. Don't you think that was too much, and if so how am I to make them straighten it? 3. Does a cow's milk vary as to test? That is, will it test more or less by change of feed, or as she nears the time to go dry? Will sour cream test as well as sweet?

Ontario Co., N. Y. W. H.

1. It does not seem to me that there can longer be any serious question as to the value of silage where dairy cows are kept and good corn can be raised. The only question remaining is as to whether the necessary investment will be warranted by the number of cows maintained. Opinions will differ as to this, but, in my judgment, no dairyman in position to utilize one should attempt to keep ten or more cows without a silo; and one can be profitably used for a smaller herd. With the proper use of lime, you can probably raise good crops of clover hay, and with an abundance of this, and silage, you will be in position to make the most from your dairy.

2. Transportation companies in this State are required to keep a copy of their freight charges on file with each agent and show it upon request. By applying to your local agent you will be able to ascertain if you have been overcharged, and if you find that the published rates have been exceeded in your case, you should place a claim for refund with him.

3. A cow's milk is constantly varying slightly in the amount of butterfat which it contains, but this fluctuation is within very narrow limits and is affected but little by the food given. The milk of any cow becomes richer, however, toward the close of her milking period. Souring cream does not alter the amount of butterfat which it contains. M. B. D.

Silage Questions.

Is frozen silage good? What size silo will hold enough to winter 10 cows? Is wood silo as good as concrete? What kind of food can be used for cows? Can Crimson clover be used, cut green, with corn? Do you cut silage fine or not, if so how fine? How is silage packed into silo? Do you salt silage when put into silo? How much silage can be fed to one cow? Is there anything needed like bran or meal of any kind on silage feed?

North Carolina. R. W. J.

Silage is apparently not injured by freezing if fed soon after it has thawed out and before it has had opportunity to spoil. Allowing four tons of silage per cow, ten cows would require a silo of 40-ton capacity, or 10 feet in diameter and 27 feet in height. As extra capacity is needed when filling a silo to allow for settling, 30 feet in height would be better. A narrow, high, silo is better than a broad and low one of the same capacity. Each kind of silo has its own advocates; wood is the material most commonly used and is thoroughly satisfactory. Good hay or straw of any kind may be fed with silage, though the clovers save grain by furnishing needed protein to balance the silage. Without clover more grain needs to be fed, and the high protein concentrates like cottonseed meal, gluten, brewers' grains, etc., are best. Many different crops have been successfully ensiled, but where corn can be raised to advantage it is easily the best crop for that purpose. Crimson clover would best be cut early and cured for hay to feed with corn silage. The finer silage is cut the better it packs, about one half inch is a desirable length. Silage is elevated into the silo by the same power that cuts it and it packs by its own weight, aided by a man or two in the silo to tramp it as it is filled. Even distribution of the silage seems to be of more importance than tramping. Silage is not ordinarily salted. A medium-sized cow in full flow of milk will eat from 35 to 40 pounds of silage per day, in addition to some hay and grain. Silage alone is not a well-balanced ration and is best fed in connection with clover hay and some grain. Corn meal should not be fed with it for milk production, but wheat bran and middlings and the grains mentioned above are suitable. M. B. D.

Tuberculous Beef.

How can I know when beef is fit to use of animals that have tuberculosis? I refer to cases where they have a cough and the lungs damaged, but appear healthy otherwise, and the beef is fat and looks well. If there are spots like bruises on feet, legs or body, in either case, would it be fit for use?

Canada. W. W. M.

If there is tuberculosis of the lungs or glandular structures of the body, but the disease is of moderate extent and confined to these parts, the healthy flesh may safely be used. If, however, careful examination of the meat shows white or yellowish ulcerations, small grape-like masses of "tubercles," or other evidences of disease, it should be disearded. A tubercle is a whitish or yellowish mass, varying in size from that of a pea, or smaller, to that of a walnut or larger. They are usually found in groups, and may affect any part of the carcass. They are sometimes found covering the under surface of the ribs, and in softer structures, like the liver, may often be seen as broken-down ulcerations filled with matter. M. B. D.

MANAGEMENT AND BREEDING OF HORSES, by Merritt W. Harper. This is a book full of information, which answers practically all the questions that may come up in the daily care and work with horses. Breeding, feeding and training are discussed very fully, while the chapter on common ailments of the horse touches all the ordinary troubles that come up on the farm or stable. Breeds and types are explained, and there is much wisdom in the advice on harnessing, as well as training. Published by the Orange Judd Company, New York; 446 pages, illustrated; price $2.00.

Don't Paint Them

Let's Buy Amatite ROOFING

It Needs No Painting

THE heavy winds and rains that tax ordinary ready roofing to capacity have no effect on Amatite. With its heavy pitch and felt body and mineral surface Amatite can weather the most violent storms.

It never needs painting.

With its low first cost and saving in paint, it is the most economical ready roofing on the market.

Feed Ensilage This Summer When Pastures Get Low

To secure the maximum results, stock should be fed green feed all the year round. Its succulence produces rapid growth and a heavy flow of milk. No other feed equals ensilage in succulence. It is as valuable and economical to feed in summer as in winter. It pays, then, to fill a silo for summer feeding. You will keep ensilage succulent and palatable all-the-year-round as the day the corn was cut, if you have a

Natco Imperishable Silo

(Patented)

Built of non-porous vitrified-clay hollow blocks; its glazed surface excludes air and moisture. The two dead air spaces protect contents from heat and cold. Each layer of blocks is reinforced by continuous steel bands.

Weather Proof — Decay Proof — Vermin Proof — Fireproof

The Natco Imperishable Silo will last for generations — any mason can erect it — never needs painting — walls will not warp or shrink — no hoops to tighten — no continual repair bills — the first cost is practically the only cost. The Natco Imperishable Silo has a survival value unequalled.

FREE SILO BOOK. Full of information about ensilage and summer feeding. Describes completely the Natco Imperishable Silo. Write today. Ask for catalog "L."

35 BUSHELS PER ACRE was the yield of WHEAT

160 ACRE FARMS IN WESTERN CANADA FREE

on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats, 50 bushels for barley and from 10 to 20 bushels for flax. J. Keys arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard, is now the owner of 320 acres of land. In 1913 had a crop of 200 acres, which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.

Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.

The crop of 1913 was an abundant one everywhere in Western Canada.

DO NOT USE GRADE BULLS.

I have a Guernsey bull calf from a purebred Guernsey bull, the mother seven-eighths Guernsey and an extra good cow. Would you advise keeping such a bull for a sire to build up a herd? F. M. S.

Michigan.

The only condition under which a grade sire should be maintained in a dairy herd is merely an instance where the only desire is to freshen the cows. Only purebred animals breed true to type, and it is poor judgment to trust even a 15/16 bull to bring about improvement in a grade herd. If a man keeps a herd of dairy cows, not paying any regard for the calves produced, then a grade bull will freshen the cows as well as one of good individuality and good breeding, but the dairyman who is ambitions to have the name breeder added to his name should by all means use only purebred and registered sires, preferably one whose usefulness has been tried in some one's else herd. In my mind the greatest crime of the present day dairying is the slaughtering or sale of bulls for three cents per pound when they are in reality worth hundreds of dollars if they could be transferred to different dairymen in the community that are wanting just such sires. A mature bull that has proven his usefulness in the dairy herd by means of records which show that his daughters during their first or second calf have given an increased amount of milk when comparison is made with the heifer's dam, is worth far more to the owner of a grade herd than a young sire whose breeding may appear more select, but who has his reputation as a sire to make.

F. M. S. should in my judgment sell the bull calf referred to, and look around in his neighborhood or get in touch with some breeder of Guernseys who has a three or four year old sire that he is desirous of selling to the butcher for three cents per pound because he is related to the females he has in his herd that he is desirous of mating. By so doing he could start out definitely with an assurance that this bull would render service because he has rendered service, and unless he is jailed up in a box stall, and groomed with a pitchfork, there is no reason why he should not continue his usefulness until he is 10 or 15 years old. Grade bulls are all right for the cow dealer, but they have no part with the man who is desirous of being credited with the dignity of being a breeder.

F. C. MINKLER.

MISFITS IN BREEDING.

The coming season a good many are going to breed mares to the handiest horse without regard to the offspring being adapted to our needs. It will not pay us. Some of us have taken light trotting-bred mares to the handiest stallion, regardless whether he is a Shire, a Percheron or mongrel. We have had our farm experience and figured up in dollars and cents we are out because of the neglect. Our present farm horse power does not produce the dollars and cents in returns that it might be doing had we invested a dollar or two in time, and had we forgotten convenience.

We have a Percheron draft mare; although a grade, she is built on approved purebred lines. She weighs between 1,400 and 1,500. For convenience sake, five years ago, this mare was bred to a very ordinary stallion in the neighborhood. He was quite a serviceable farm horse, but the get of this stud is unsatisfactory. The result is a horse weighing about 1,500, much smaller than either the sire or dam. The offspring is a very ordinary farm horse in build, in service on the farm and in intelligence.

The results from another mare have enlightened us. She is trotting-bred, and her first colt was from a Coach sire. The mare weighs about 950 pounds, while the Coach weighed about 1,350. The result from the combination is a well-built 1,250-pound horse built on Coach lines. He is a very serviceable animal. Again for convenience sake, the mare was taken to a draft stallion of the ordinary kind. The result was a colt on draft lines, and she weighs scarcely 100 pounds more than the dam, and the result is neither drafter nor trotter. Another colt from the same mare bred to a trotting-bred stallion has produced a first-class road horse. Our good results from this mare were from the trotting-bred or the coach horse, while from the draft mare they were from the draft stallion. We have a two-year-old colt from a purebred Percheron draft stallion, and from the draft mare. This colt will not be two years for two months, and he is heavier now and far better built as a colt than the four-year-old progeny from the ordinary stud and the draft mare.

The advice of a good many successful breeders agrees that it does not pay to breed a light trotting-bred farm mare to a heavy draft stallion. The offspring might be gratifying, but generally the results are unsatisfactory. It does not pay to breed a draft mare to a mongrel or trotting-bred stallion. Mr. Nicodemus, one of the institute speakers of Ohio, and a successful breeder, advises against the breeding of a 1,200-pound draft mare to a ton stallion. He suggested the breeding of a 1,400 to 1,600-pound stud, and grading up the weight gradually. Extreme difference in weight of sire and dam in his experience produced frequently an inferior colt. It will pay the farmer to drive half-way across the county to the stallion that is adapted to his needs. In the offspring a day's time would be worth $50 in a better colt.

Look over every factory in the United States and all foreign countries, you won't find its superior at any price. The New Galloway Sanitary is the latest and greatest produet of my big Chain of Factories. It's the mechanieal masterpiece of all my years in the manufacturing business. It's absolutely in a class by itself. But I am not going to ask you to take merely my word or anybody else's word for my machine. Not for a single second. I am going to give you the opportunity of finding out the real facts for yourself.

Try it 90 Days at My Risk

I'll let you try my New Improved Galloway Sanitary any way you wish. I'll send you one of my wonderful new separators, size you want, right to your farm for 30, 60 or 90 days' trial absolutely free. I want you to test it out every way you can think of. Compare it with any other machine that you know of, no matter what the price. If anybody else is trying to sell you a separator, make them let you take their machine and set it right up by the side of mine. Compare them at every point—easy running, easy cleaning, close skimming, mechanical construction, sanitary features, in any way you can think of and then keep the machine that suits you best.

If you think that there is any other separator in the world at any price that you would rather have than the Galloway, after you have given it a good, fair test, ship it right back to me at my expense. I'll agree right now to pay all the freight both ways so you won't be out a penny or under the slightest obligation if you decide not to keep the separator after having had the free trial. If you decide to keep it, I'll guarantee to save you from $30 to $50 besides giving you a separator that absolutely has no equal in the world at any price. Then on top of this remarkable offer, remember my New Galloway Sanitary is backed by a

10 Year Guarantee—$25,000 Bond

Every single New Galloway Sanitary cream separator that leaves my factory has a straight 10-year guarantee on materials and $25,000 legal bond back of it. You take no risk of my separator not only giving you the greatest of satisfaction for a 90-day trial period but for practically a lifetime. My 10-year guarantee and my bond are printed in black and white and there are no strings tied to them. They are regular contracts that protect every Galloway customer. Accept this most liberal offer with this positive protection back of it. Don't delay. Write me now. Get my catalog and full details of my Offer. Just fill in, cut out and mail the coupon.

90 Days' Free Trial

10 Year Guarantee

$25,000 Bond

FREE Cut Out and Mail Coupon for My Free Catalog and Valuable Dairy Cow Book.

My New 1914 Book shows my New Galloway Sanitary Cream separator and explains my liberal, direct from factory, plan of selling it at the lowest prices ever made on a strictly standard, high grade separator. Don't fail to get this book and investigate my new separator before you think of buying any other style or make. It's money in your pocket for it means a saving of $35 to $50 to you.

Then when you send for my catalog I am going to give you full details of my New Special 1914 Offer—the most liberal offer ever made and a coupon which entitles you to a free copy of my valuable book of information—Galloway's Dairy Cow Book—regular price $1.25. You want my Dairy Cow Book without fail. It's chuck full of cow facts. It will help you make your cows pay you a whole lot bigger profit. It tells how to feed and stable your cows—How to build up a milk-producing herd—How to make top quality butter—How to test your milk and many other important things you ought to know if you want to make big money in the Dairy business. This book is free to you. Just fill in, cut out and mail free coupon or write me a postal. Then as a clincher, I am going to make you a still bigger offer—one that will help you get your separator partly or entirely without cost to you in the end. This is my Co-operative-Profit Sharing Offer that has helped thousands of men pay for their machines. No canvassing. No soliciting. Just a straight business proposition. Write me today. Do it before you lay this paper down. Address

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Ration for Jersey.

Will you give me advice how to feed a Jersey cow, the best feed for milk and the right proportion? I have plenty of mangels and carrots and good hay; have been feeding gluten and bran, but do not know just what quantity we ought to give. F. R. G. B.

A common proportion for mixing bran and gluten is three pounds of gluten to five pounds of wheat bran. Of course the proportions, and the quantity to feed depend to a great extent upon the kind of hay you are feeding, the condition your cow is in and the amount of milk she is giving. If your hay is Alfalfa or clover you would not require so much gluten, as cornmeal could be substituted at a lower price. In regard to quantity it is usually best to let the cow decide that, feeding all she will eat and digest properly without getting off her feed. Your mangels and carrots should be cut into small pieces and fed liberally all that will be eaten with a relish twice a day. C. S. G.

Another Milk Ration.

Will you give your opinion as to feeding both milch cows and young stock the following feeds? 800 pounds rye, 500 pounds oats, 500 pounds corn and cob, all being ground together; in addition to the above feed the milch cows to have a fair allowance of dried brewers' grains soaked with the mill-feed. If you think it would pay to buy and mix other concentrates with this feed, state what proportion and what feed. J. H. D.

For milch cows I think you will find it profitable to mix 500 pounds of cottonseed meal with your feed. For young stock your mixture is very good as it stands. C. L. M.

Dairy Ration.

Will you please give me a balanced grain ration for dairy cows fresh now till they go to pasture? For roughage I have clover and Timothy mixed hay. I have my own oats and corn, which I can grind myself, and have in stock bran, middlings and gluten feed, and can get oil meal or cottonseed meal. H. C. P.

If you will mix equal parts by weight of the feeds you have on hand, and two parts of either cottonseed or oil meal, preferably cottonseed, you will have a very good milk ration. Feed six to seven pounds to a cow giving 25 pounds of milk daily, and more or less in proportion to milk flow. C. L. M.

Improving Milk Rations.

I have a cow, part Jersey and Holstein, came in middle of November. I am only getting from four to five quarts of milk from her a day; am feeding her bran and middlings. Can you tell how to feed her to better advantage, to produce more milk? Should she give more milk or is it the nature of the cow? She is a young cow and in good health.
Ohio. J. W.

Bran and middlings with an unknown quantity of roughage makes a very poor ration for the production of milk, so any cow freshening in November whether naturally productive or not, could not be expected to give a large quantity of milk at this time. If, for example, you are feeding mixed hay you should add one pound of oil meal and two pounds of cottonseed meal to your grain ration, and you will have a much better chance of producing a satisfactory flow of milk. C. S. G.

Winter Feed for Farm Horses.

We find that it is impossible to give any set rule for feeding either a working horse or one that is idle. It is mainly a matter of judgment, and best results can be secured only after long experience. During the Winter, when horses are doing practically no work, about the best method is to turn them out in the barnyard, where they can have plenty of cornstalks to pick at, and where they have plenty of room to exercise. With such treatment an ear of corn twice a day will be all the grain required. In Spring and Summer, when doing very hard work, we feed good sound corn for their grain ration, and govern the quantity by the size of the horse. Eight or nine large ears (or three to four quarts shelled corn) would be an average meal for a medium-sized farm horse. For medium work oats and corn mixed half and half and fed at the rate of three to four quarts to a meal will give satisfactory results.

The condition of a horse, however, does not depend on the grain ration alone. The hay fed night and morning will count fully as much as the grain, and it should be bright and clean, and cured so as to be palatable to the horse. Alfalfa and clover fed in moderate amounts, either night or morning; or preferably mixed with good bright Timothy and fed both night and morning will do much to keep the horse in ideal working trim.
South Jersey. TRUCKER, JR.

Ration With Molasses.

I am feeding four pounds of dried beet pulp wetted with molasses dissolved in hot water; also one pound wheat bran, two pounds gluten, and two pounds cottonseed meal a day. Is this a good ration, or would you advise some change? Do you think it profitable to feed molasses? I have plenty of clover and Timothy hay, but no silage. M. A. A.

I see no reason for making any change in the ration you are feeding. I believe that a certain amount of molasses may be fed profitably. It furnishes a comparatively cheap source of carbohydrates, and also has a good effect on the digestion. C. L. M.

Silage for Horses.

Every year there are questions about the wisdom of feeding silage to horses. Here is positive advice from the Colorado Experiment Station:

"Silage is not a safe horse feed. It is used to some extent for that purpose, but the feeder must be extremely careful in the examination of the silage that goes to the horses. Horses are more subject to digestive derangements than most other live stock, and while a comparatively small amount, say a fifth of their feed, by bulk, may consist of good silage, there is great danger from overfeeding, or from the feeding of moldy or spoiled silage.

"It is impossible wholly to prevent moldy spots in silage, these being caused frequently by imperfect packing, leaving slight air pockets. Also, it is very difficult to make sure that there are none of these moldy spots in silage which is being fed. Its use should be confined chiefly to growing colts and idle horses. As it contains about 75 per cent. water, it causes a horse to sweat easily and affects him otherwise in the same way that green feed or pasture does."

The General says:-

Every building on your farm will be a better, more valuable building if you give it a *Certain-teed* roof! The label on

Certain-teed

ROOFING

guarantees 15 years' service. No "test" for toughness, pliability or anything else can give you *advance* knowledge of how long a roof will last

Roofs don't wear out—they *dry* out. Let the three biggest mills in the world guarantee the roofing you buy.

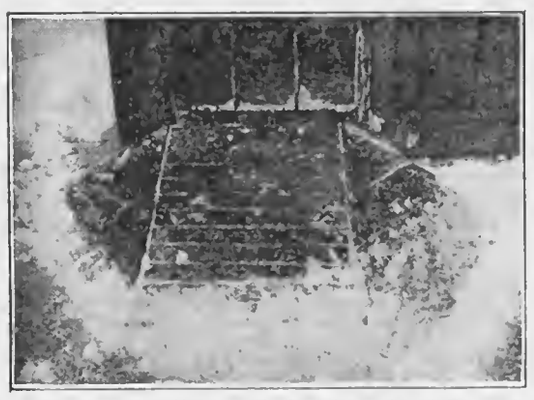
SELECTING THE BREEDERS.

The time is at hand for mating up the breeding pens on the farm. The poultrymen and fanciers will have done this before now, as their season begins early, but most farmers do not care to hatch before late April and early May, after the weather has become settled and the chicks require less care. If no selection other than that of eggs is made, little or no improvement can be expected in the farm flock. Mediocrity will perpetuate mediocrity, and no improvement in size, type, or productivity need be looked for. Farmers cannot trap-nest, and must depend upon some other method for selection of breeders. It will usually be possible to give a few hens an enclosure apart from the rest of the flock for a few weeks in the Spring, until the needed eggs for hatching have been secured. It may be taken for granted that only purebred fowls will be hatched this Spring, for, whatever may be said for or against mongrels in other stock, there is no need for anyone, nowadays, to keep mongrel



RUNWAY FOR CHICKS.

poultry. Careful experiment has shown that there is nothing gained by it, and the objections are obvious. Flocks of purebred fowls are so numerous and widespread that it should be possible for any farmer to obtain eggs from the breed of his choice and maintain his stock pure. It is not necessary, or even advisable, frequently to introduce new blood, and the old practice of changing cockerels with the neighbors every year should be given up. With careful selection of the breeders, choosing the strong, vigorous members of the flock, one should be able to build up a flock superior to those of his neighbors, and one which would only suffer by having their blood intermingled. In selecting a cockerel to place in the breeding pen choose one t at shows his vigor in his every action. He should have a blocky head, with short beak, bright full eyes, full comb and proud carriage. He should be of good size for his breed, "scrappy" to the point of insolence, generous to the hens, but an overbearing bully among his brethren. If he thinks that he can "lick" his master, so much the better. Not having been compelled yet to acknowledge the equality of the other sex, there is an air of masculine strength and superiority about vigorous males among the lower animals that is easier to see than describe.

Equal attention should be paid to vigor in the hens, for a hen that can't live can't lay. The hens that go into the breeding pen should be of good size, and layers of large eggs. A large egg means a large chick; this is the chief point in

GASOLENE TANK ON BROODER.

favor of using hens instead of pullets for breeders. Another one is that hens have demonstrated their ability to live through a full period of laying and pullets have not. A well-developed pullet will produce good chicks, however, and need not be discarded if enough hens are not at hand. Most people think that the laying type in hens means a long-bodied fowl, with wide spread legs and deep abdomen. As a dairy cow shows something of her capacity for production in the size of her paunch, so, in some measure, may a hen. A good laying hen, like a good workingman, is an early riser, but late in retiring. She is eager to begin eating in the morning and loth to quit at night. If she has made a good record during her first year, she will have begun laying early and molting late; and the pretty yellow legs that she began with will have faded out. Note that the useful females are seldom the pretty ones; among hens, I mean. It is now believed that prolificacy is transmitted through the male; so if you have a hen that you know is an extra good layer, mark her chicks and choose the best of them, if all right otherwise, to head your breeding pen.

M. B. D.

BOSTON MARKET REVIEW.

The greenhouse people who ship or sell their products to Boston are receiving a fair return for their trouble at this time. The frost damage in the South has helped them very much in obtaining profitable prices for their product; their dandelions bring around $2 per box; beet greens $1.50 to $1.75; lettuce up to $1.50 per box, with romaine, escarole and chicory 75 to $1 per box; tomatoes 50 cents and better per pound. Southern spinach sells at a good figure, going at $3.50 per barrel; kale bringing up to $1.75. California asparagus is reasonable at $3 to $4.50 per dozen; cauliflower $2.50 per crate; celery $1.50 and $2 per dozen. Southern green and wax beans $3.50 and $5 per basket. Cabbage $2.50 per crate.

Strawberries reasonable at 25 to 35 per box; oranges $3.75 and better per box for best, other grades $2 to $3. West India pineapples $3.50 and $4 per crate. Grapefruit $2.25 up to $4 per box; lemons $2.75 to $4. California oranges $1.50 to $2.50 per small box. The few cranberries left, go at $13.50 and $14 per barrel and $5 per box. Best bananas $3 per bunch. Others $1.25 and $2.25 for yellows; reds $2 to $4.50 per bunch.

Native old cabbage $1 to $1.50 per barrel; rutabagas $2 per bag; White Egg $1.25 per bushel. Beets $1.50 per bushel; carrots $1; parsnips $1.25; radish $2. Native onions are getting poor and are being closed out if possible, to get a reasonable offer. $2.50 and $3 per bag of 100 pounds usually takes them. Cuban and Mexican stock bring $3.25 or more per crate. Those who have some good sound squash left are happy, as it is no trouble to move them for $80 per ton. The Southern frosts again affect the potato market, giving the holders of Maine stock a chance to stiffen prices a bit when the demand is on as at present for planting. These bring $1.55 to $1.70 per bag of two bushels; Southern sweets $1 per basket. Cucumbers are easy at $8 per box for best and range down to $3.50 for poorest grade.

The apple market is good on fancy fruits, but demand is limited, as other fruits are plenty at a lower figure. Best Baldwins easily bring $5.50 to $6 per barrel; others $3.50 to $4.50. Good Russets go at $3.50 to $4.50; common native box fruit $2. Western fancy box fruit around $4 for Winter Banana and Delicious, with Rome Beauty and Spitzenburg $2.50 to $3. Exports, which have been almost half those of last season, are about over.

Baking bean prices are medium, pea beans $2.10 per bushel. Yellow eye $3.25 and kidney about the same or a few units lower.

Butter is still dropping, having lost about one-half cent per pound this week, with best Northern creamery going at 28 to 29 in tubs, boxes and prints about one cent per pound more. Best western 27 and 28; good to fair butter brings 24 to 26. Cheese holds its own better than butter, bringing 19 and 20 for last Fall stock, others 17½ to 20.

Eggs are about at their lowest ebb, yet reports of storing are not heavy. Their being about the cheapest article of food at present is generally known, and advantage taken of it by retail buyers and users. Best fresh bring 24 and 25; good 22 and 23. Live poultry trade is good and prices excellent; some bring 18 and better per pound. The bulk, however, bring 16 and 17; medium size are wanted and bring best prices. Dressed fowl and chickens about 20 cents per pound; roosters 15; capons 25 to 28; turkeys 18 to 24.

At Brighton market beef on hoof goes at $7.50 to $8.50 per hundred pounds for best grades; others 6½ and seven cents, while poorer grades bring four to five. Sheep and lambs light supply, prices easy at four to six for sheep and six to eight for lambs. Veal calves eight; western hogs nine to 9¼; dressed hogs up to 11½.

Milch cows plenty for demand, which is now moderate; prices range from $50 to $75 for ordinary stock, extra good ones higher. Calfskins about 22 per pound; cow hides 12; steer 13. Horse sales are moving along satisfactorily and prices are better for seller than buyer. Farmers are reported buying largely of medium weights for reason of lower cost and good ability to do work required; 1,800 to 1,900-pound horses bring $350 to $450, if sound, some even better; mediums $250 to $350; common and light weights $175 and $225 each.

Hay holds about the same at $22.50 per ton for best, other grades $15 to $21. Grains are higher or inclined that way at wholesale; meal $1.50 per bag; bran $30 to $31.75 per ton; middlings $31; mixed feed $30 and $32; cottonseed meal $32 and $33; linseed $32.50; beet pulp $27; gluten $32.

A. E. P.

Two Poultry Wrinkles.

The picture shows a new position for gasoline tank on Cornell brooder, which I find handy in filling. With tank low down the stepladder is eliminated and danger from spilling and fire is lessened. The other picture shows an improved runway for chicks, which I find works well. It has no corners at base, and the little fellows always find their way back to brooder.

M. E. K.

Kingston, R. I.

SHERWIN-WILLIAMS

PAINTS AND VARNISHES FOR FARM USE

Paint over your kitchen floor, bedroom floors and hallways. Make them artistic, easily cleaned and sanitary. Unsightly scars, dirt-catching scratches can't be covered up with stain—these things need *Paint!* And you or anyone can paint them easily and quickly by following the directions given with

SHERWIN-WILLIAMS INSIDE FLOOR PAINT

Compounded first for extra durability and next for quick drying. For this reason, stands harder usage than any other paint under similar drying conditions, as proven by great railroads and steamship companies. Can be walked on in twenty-four hours if necessary.

This handsome, extra durable paint is only one of a great family of artistic finishes described in our book, "Paints and Varnishes for the Farm." Send for this book today—it's free.

Best dealers everywhere. Address all inquiries to

The Sherwin-Williams Company, 635 Canal Road, Cleveland, Ohio

THE CHEAPEST ROOF

is not the one that can be bought at the lowest price—usually it is the most expensive roof you can buy. Cheap roofs made of paper and tar may be good enough for some temporary shed or outbuilding; but for a permanent building it is economy to put a permanent one over it—one that will stand the heat of summer as well as the snow and ice of winter—a roof that the owner can feel confident will protect the building and its contents from damage, this year, next year and 25 years from now

"RAIN-TIGHT" RUBBER ROOFING

fill all the requirements. And there's a reason for its durability—it is made of Trinidad Lake Asphalt which is the standard of the world. You know how asphalt pavements withstand the pounding of horses hoofs and heavy traffic on city streets. What wonder then if the same material made into roofing is well nigh indestructible and everlasting.

Our brand of **"Perfect Roofing"** is the same as **"Rain-Tight"** with mica flakes added to the surface which make it fire resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof.

Perfect Rosin Sized Sheathing and Perfect Tarred Felt are Best for Sheathing Purposes

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us today.

MAURICE O'MEARA CO., 448 Pearl Street, New York City

This Hay Carrier Is 12 Months Ahead!

DON'T think of buying any Hay Carriers until you see the new 1914 Model HARVESTERS. They're at least one year ahead of ordinary kinds both in mechanical improvements and strength. Double the size and twice the weight of old-fashioned, everyday fork carriers. Simple and strong—practically no repair expense.

Harvester Hay Carriers

1914 Models—for Steel, Wood or Cable Track

Made in three types — sling or fork style. Eleven new and distinct improvements make them mechanically perfect. No matter where you unload your hay, the Harvester will handle it without re-roping or changing pulleys. You won't consider old-fashioned hay carriers after seeing the Harvester.

Our big "Hay Tool Book" tells the whole story. Let us send it. *We'll include the name of a dealer in your town who will gladly show you the Harvester Line for 1914.*

YOUNG CHICKS

die of bowel trouble more than any other cause. It is estimated that of every 1000 chicks hatched each year less than 400 reach marketable size. Germozone users raise, usually, 90% of chicks hatched. Germozone keeps the bowels regular. It prevents diarrhoea from overdrinking of water; from eating musty or spoiled food, etc. It should be given in drinking water twice a week from the day they are hatched. It stops the loss. Every chick that dies cuts badly into the profit from the rest. Every chick saved will pay the cost of a bottle of Germozone.

One size only, 50 cents, at dealer's or postpaid.

The Henyard.

Bone Meal for Poultry.

In a recent issue there was an article recommending bone meal as good for chickens. I have a lot of bone meal, pure crushed bone, such as I use for fertilizer on roses, etc. It costs $42 per ton. I have no guarantee that it is pure ground bone. Is this the kind that you mean is good for chickens and if so can I give them all they will eat of it?

Stockbridge, Mass. J. M.

We should be careful about feeding fertilizer bone, or fertilizer tankage to live stock. The bone may have been treated with sulphuric acid, or it may contain substances which would be injurious to the stock. Personally, we would not feed bone, scraps, or tankage, except under a guarantee that it was suitable for the purpose.

Worms in Poultry.

Can you tell me what is cause and treatment of small hard white or yellowish worms in gizzard of White Leghorn cockerels. Their health does not seem impaired. R. P. F.

New York.

These are parasitic worms which infest the crop and other digestive organs of fowls and sometimes lead to the death of the birds through destruction of the tissues. Perhaps as good a remedy as any is oil of turpentine, diluted with an equal quantity of any bland oil, and the mixture administered in tablespoonful doses. Dose to be repeated after an interval if necessary. Chopped garlic in the food is also very distasteful to these parasites and should be given if at hand. M. B. D.

Wyandottes and Plymouth Rocks.

I notice an inquiry asking for the distinguishing mark of the White Wyandotte. I am the person who originated the Silver Laced and White Wyandotte and made the standard of same. A few years ago the breeders of the Wyandotte type insisted upon the breeders of the Plymouth Rocks that they should stick to the type. The two birds are entirely different in type, the Wyandotte being a bird of curves and the Plymouth Rock being a bird of angles; in other words slab-sided and long-legged, and as your correspondent says, weighs about a pound more. Now if you would refer to the Standard of Perfection of various birds, you would get all the information required.

I also notice some one asks about the difference in the laying qualities. Being somewhat of an expert in this department, would say that whatever the variety may be, the breeder can by selection make the laying qualities whatever he desires. As a matter of fact, one of the largest experiment stations shows that the Silver Laced and the Buff Wyandottes excel all the other varieties in their year's work up to the first of January. This does not mean, however, that the Plymouth Rock, Cochin, Langshan, or in fact any other variety could not, by careful selection, be made to lay just as many eggs. Should your correspondent happen to strike a good laying strain of even a mongrel fowl, he might find that they lay more eggs than some of the purebreds, as fanciers of the purebreds often neglect this for *feather or type.* I am trying to emphasize the fact that laying qualities are within the manipulation of the fancier and breeder.

FRED A. HOUDLETTE.

R. C. White Leghorns.

Will you tell me whether the R. C. White Leghorn is as good a layer as the Single Comb? Can they be made to lay in five or six months after hatching? If so on what feed? H. S.

New York.

The chief difference between the Rose and the Single Comb varieties of the Leghorns is in the comb, though as the Single Comb Whites are more popular, good laying strains are probably more numerous and more to be depended upon than the Rose Comb variety of that color. Either should be brought to laying condition in five to six months from hatching, if well fed and kept growing from the start. They should have the ordinary grains, of which corn and wheat usually form the greater part, and a mash of ground grains combined with meat meal of beef scrap. Skim-milk is also a very valuable addition to the feed of growing chicks. M. B. D.

Feeding Beets to Hens.

I notice a reader asks for a beet pulping machine to prepare beets for his hens. Why anyone should spend time pulping beets for hens is beyond me. Simply split the beets in half and the hens will eat until their droppings are red like blood. A container of chicken wire, V-shape, at a suitable height, is good for exposing the beets. After they learn the trick splitting the beets is superfluous. E. L. S.

Massachusetts.

YOUNG'S STRAIN

SINGLE COMB WHITE LEGHORNS

I HAVE NO OTHER BREEDS

They are the standard for all the Leghorns of all America, and the greatest layers of all varieties of domestic fowl. I have hundreds of yearling hens and cocks for sale. Mating list free. Address

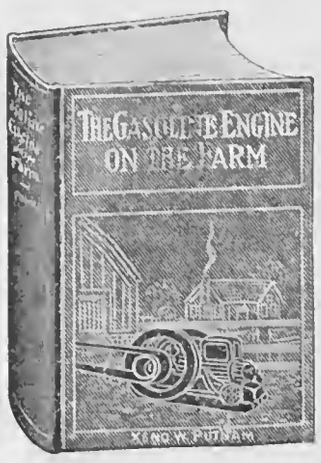
THE GASOLINE ENGINE ON THE FARM. Its operation, repair and uses. By Xeno W. Putnam.



This is the kind of a book every farmer will appreciate and every farm home ought to have. Includes selecting the most suitable engine for farm work, its most convenient and efficient installation, with chapters on troubles, their remedies, and how to avoid them. The care and management of the farm tractor in plowing, harrowing, harvesting and road grading are fully covered; also plain directions are given for handling the tractor on the road. 330 pages. Nearly 180 engravings.

This book will be sent to any address prepaid for

THE EGG-LAYING CONTEST.

The twenty-first week of the contest, ending March 27, shows the largest output to date; 3,597 eggs were laid, exceeding last week's good record by 160 eggs. Frank L. Tuttle's Barred Rocks win first place for the week with the highest score that has yet been made, viz., 59. The record is, 7, 5, 4, 5, 6, 6, 6, 6, 5, 5. W. C. Morgan's Buff P. Rocks tie with Neale Bros. White Wyandottes for second place, each pen scoring 54. The S. C. R. I. Reds of A. B. Brundage, are tied for third place with the White Wyandottes of Merrythought Farm, each scoring 53.

Barred P. Rocks made the highest average for the week as well as taking the first place. The four pens laid 212 eggs, average per pen 53. White Wyandottes are next, the five pens laying 243, average 48.6.

Buff P. Rocks are third with a pen average of 48. The S. C. R. I. Reds averaged 43.8 per pen. The White P. Rocks also averaged 43.8. The White Leghorns averaged 42.9 per pen. The R. C. Reds 41; and the three pens of Dunghills averaged 40.5. All the pens in the contest, good, bad and indifferent, averaged over 43 eggs each for the week. The week's score and the total is given below:

The total number of eggs laid to date is 30,753. It may be noticed that the Storrs Agricultural Station pen of White Leghorns, pen No. 42, the pen that has been fed sour milk ever since they were hatched, has caught up now with Francis F. Lincoln's pen of White Leghorns, which hitherto has been the leading pen of that variety. Tom Barron's pen of White Wyandottes still leads in the total production by 140 eggs. GEO. A. COSGROVE.

MAMMOTH TOULOUSE **GEESE EGGS**—35c. EACH. DELIVERED CRANDALL FARMS, Albion, N.Y.

RHODE ISLAND REDS
The famous Vibert flock of beautiful, brilliant, glowing cherry to mahogany red-to-the-skin rose and single comb thoroughbreds. Not uncertain layers mated to males from uncertain layers, but specially selected, long backed, low tailed, certified trapnested record layers, scientifically line bred along Government lines for heaviest winter egg production, with yearly trapnest laying rates of 211 to 267 eggs; bred away from broodiness, and mated to large, vigorous, brilliant red males out of heaviest trapnest record layers. Heaviest winter laying, large, hardy Reds in America, hen hatched and raised, on absolutely free range, in wide-open front colony houses, on a scientific plant absolutely free from roup and white diarrhœa. Highly fertile, clean, well shaped, unblemished eggs, gathered hourly, shipped daily, delivered when wanted, guaranteed unbroken. Vibert Vitality Day Old Chicks. Splendid breeding cockerels from trapnested hens, trios, mated breeding pens for sale. Prompt shipment, safe delivery all over North and South America, courteous, strictly upright dealings. Mating booklet upon receipt of stamp.
VIBERT RED FARM, Box 1, Weston, New Jersey

AILING ANIMALS.

Pin Worms.

Six of my horses have had pin worms badly all Winter. I think they came from feeding fodder early in the Fall. They have had more feed than the rest and look the worse. I have fed salt, sulphur, and sulphate of iron (equal parts). I have injected milk and turpentine. Have fed oats, bran and the best Timothy hay, and then change back to corn again. I admit that after the use of the milk and turpentine I saw live worms pass, but even after careful treatment for days there seem to be just as many worms as before and the animals do not improve. I have not fed fodder for two months now. I have also used the old remedy, "hickory ashes." These horses are hunters and race horses and now is the time to put flesh on for the Spring training and they do not respond. Can't you suggest something else? W. M. A.

Pin worms live in the rectum and are not killed by internal medication. Worm mixtures containing copperas in sufficient quantities turn the manure black and destroy the worms in the intestines so that they do not appear in the manure. Pin worms commonly are associated with intestinal worms. Better give each horse two ounces of turpentine in a pint of raw linseed oil as one dose, after starving the animal for at least 12 hours. Repeat in two weeks if thought necessary. Three times a week inject into the rectum two or three quarts of soapy warm water containing one cupful of tobacco decoction made by steeping tobacco stems or leaves in boiling water; or use a decoction of four ounces of quassia chips to the gallon of hot water. A. S. A.

Sore Shoulders; Eczema.

1. I have a fine work horse about seven years old that I have owned for two years; every time I work him in a plow or harrow his shoulders get sore and all of the hair comes off. I have tried different collars and harness, both new and old, and the result is just the same. 2. A fine riding horse about the same age, every Spring has a breaking out under her stomach that extends from her breast to her hind legs, about a foot in width, and all of the hair comes off. It seems to itch a great deal and continues all Summer. We have tried different remedies that our veterinarian gave us, and it seems to do no good. What do you advise? D. A. G.

1. Fit the horse with a strong breast collar and twice a day bathe the shoulders with a lotion composed of half an ounce of tannic acid to half a gallon of soft, cold water; or use strong white oak bark tea. 2. Clip the mare. Bed her box stall with planing mill shavings or sawdust. Keep the bedding perfectly clean and dry. Do not feed corn or green grass. Feed whole oats, wheat bran and mixed clover hay. Keep the harness clean and dry. If any trouble starts, wash the parts once and then apply freely two or three times a day a salve of two parts sulphur, one part coal tar dip, and five parts of lanolin, or unsalted lard. A. S. A.

Rabbits With Sore Ears.

I have some rabbits which have a scab inside of the ear, and under this scab there are little specks about half as big as a pinhead, and they seem like lice. Could you advise some treatment? I have been using boracic acid diluted in water, putting it in the ear a drop at a time. J. M.

Cleanse the parts, removing the scabs; then keep them smeared with a mixture of one part of sulphur to five parts of lard or vaseline. A. S. A.

Pig-eating Sows.

What causes my brood sows to kill and eat their young, immediately after birth? How can I feed them to prevent them doing so? J. C. S.

This vice generally is brought on by pampering, stuffing sows on corn and other rich feed, withholding succulent or laxative feed and failing to enforce exercise every day while in pig. Such sows are flabby, soft, constipated, cross and nervous. The popular preventive is to feed salt pork to brood sows. The feeding of digester tankage as a part ration also is said to prevent the trouble. Make the sows take abundant exercise every day and feed mixed rations. Exercise may be encouraged by letting the sows root for whole oats sprinkled on a big barn floor well covered with litter. Feed Alfalfa or clover hay, adding a pound of silage or two pounds of beets, mangels or rutabagas. Give little or no corn to a brood sow. Enforce exercise. Handle the sow in her box stall every evening until she gets accustomed to the presence of man. Bring her to the farrowing time with her bowels relaxed and her muscles in good order. Then she will not be likely to have trouble in farrowing, and will be unlikely to kill and eat her pigs. A "Down East" reader of this paper once suggested a novel plan of preventing pig-eating and vouched for its efficacy. It was to remove the pigs, one by one, as soon as dropped, placing them in a cotton lined basket to be set near the stove. As soon as all the pigs are born give the sow the following "toddy" mash: One pint of rum, one quart molasses, three quarts of shorts, warm water to make one pailful. Let the sow drink this and as soon as she goes blissfully to sleep return the pigs, letting each suck and when the sow wakes up she will take to the pigs kindly. Remember it is the *sow* that is to have the rum! A. S. A.

Rickets.

I had 17 pigs born last November. Being late and the weather bad I could not let them run out on the ground very late in the Fall. I put them in the pen, each litter separate. When about two months old, one litter got something like rheumatism, could hardly get out of their nest to eat; then joints seemed to get enlarged and three of them have died. The other lot has done well up till now. I have just noticed one of them is getting in the same condition. These pigs have had good dry pens, been kept clean with plenty of oat straw for bedding; have been on double floors, so there was no circulation of air from below that could harm them. I fed them the same kind of feed I fed the sows, ground oats and barley and wheat middlings. Of late I have fed more corn; have had some separator milk that I have fed with the ground feed. Can you tell me the cause, and a remedy? C. L.

Such cases will not occur if you make sows and pigs take abundant exercise every day and feed some laxative or succulent feed. Sprinkle whole oats on a big barn floor and cover with litter; then let the pigs root for the oats. Stop feeding corn. Add roots and Alfalfa hay to the ration. Mix lime water freely in the slop. A. S. A.

Infected Eyes.

When lambs are a day or two old, and sometimes younger, their eyes turn red and become inflamed. Some of their eyes seem to have a white scum over them. I have been using hydrogen peroxide, but it does not seem to help them. What can I do for them?
West Virginia. H. C. S.

At birth wash the eyes with a saturated solution of boric acid applied on new swabs of absorbent cotton; then drop into each eye two drops of a one per cent. solution of nitrate of silver. Clean up, disinfect and whitewash the lambing stable and pens. Use the boric acid solution twice daily if any lamb has sore eyes after the preventive treatment has been given. A. S. A.

SAVE HALF Your Paint Bills

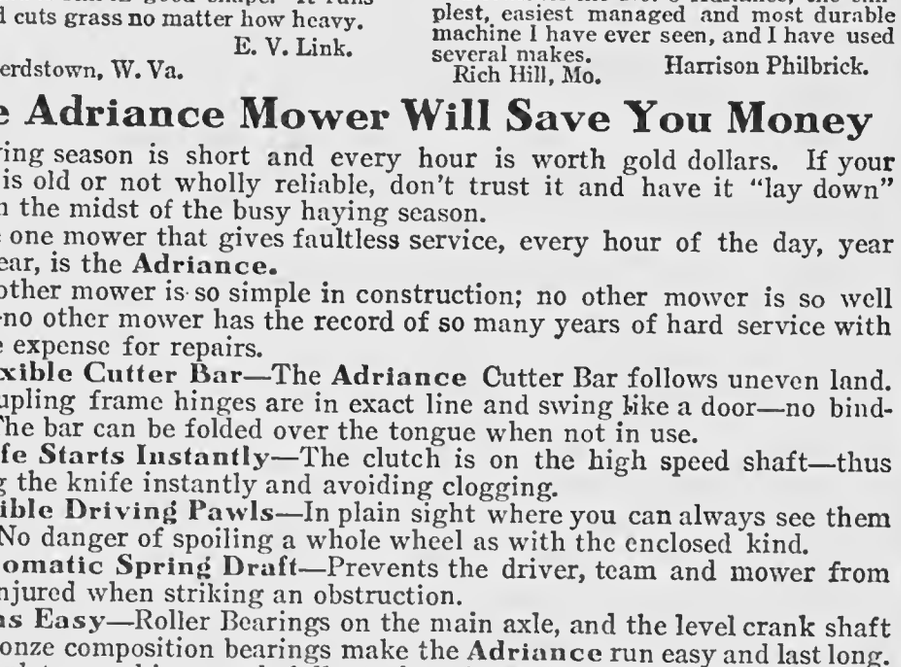
Examine the many Special Features of the ADRIANCE MOWER

Saves Time Horses and Money



Simplest in Construction
Most Powerful Cutter
Easiest to Operate
Lightest Draft
Needs Fewest Repairs

"Simplest—Easiest Managed—Most Durable"

The Verdict of the User—Read These Letters

I have an Adriance Mower that has been run for 30 years. It cut 25 acres the past season and is still in good shape. It runs easy and cuts grass no matter how heavy.
E. V. Link.
Shepherdstown, W. Va.

I have used the Adriance Mower made at Poughkeepsie, N. Y. for the last 19 years and consider the No. 8 Adriance, the simplest, easiest managed and most durable machine I have ever seen, and I have used several makes.
Rich Hill, Mo. Harrison Philbrick.

The Adriance Mower Will Save You Money

Haying season is short and every hour is worth gold dollars. If your mower is old or not wholly reliable, don't trust it and have it "lay down" right in the midst of the busy haying season.

The one mower that gives faultless service, every hour of the day, year after year, is the **Adriance.**

No other mower is so simple in construction; no other mower is so well made—no other mower has the record of so many years of hard service with so little expense for repairs.

Flexible Cutter Bar—The **Adriance** Cutter Bar follows uneven land. The coupling frame hinges are in exact line and swing like a door—no binding. The bar can be folded over the tongue when not in use.

Knife Starts Instantly—The clutch is on the high speed shaft—thus starting the knife instantly and avoiding clogging.

Visible Driving Pawls—In plain sight where you can always see them work. No danger of spoiling a whole wheel as with the enclosed kind.

Automatic Spring Draft—Prevents the driver, team and mower from being injured when striking an obstruction.

Runs Easy—Roller Bearings on the main axle, and the level crank shaft with bronze composition bearings make the **Adriance** run easy and last long.

Complete machines and full stocks of repairs carried by our Branch Houses in all principal cities and dealers everywhere. Any Flying Dutchman Dealer can show you the **Adriance**—ask him. Write us for FREE BOOKLET on Flying Dutchman Hay Tools.

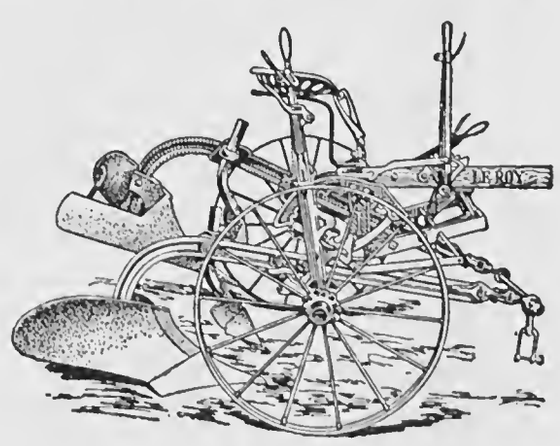
Station 290 Columbus, Ohio

These Are Reasons Why The Light Draft LeRoy Reversible Sulky Is The Best.

The All Steel Frame **LE ROY REVERSIBLE SULKY PLOW** is guaranteed to do better work than any other reversible sulky plow made.

A remarkable feature of advantage over all other makes is the noticeable very light draft. If your horses get tired and sweaty, hitch onto a Le Roy and watch them cool off. There is no need to rest your horses if you use a Le Roy. Ask any farmer.

To obtain the hardest and strongest plow points possible, only the best grades of iron are used, mixed with the utmost care to insure strength and good wearing qualities. Moldboards, points and landsides, perfectly chilled. Frame is made of high grade steel and malleable iron.



MANUFACTURED BY
The LeRoy Plow Co.
LeRoy, N. Y., U. S. A.

The LeRoy handles just as easily in small fields as large and will turn the same size furrow as any other with much less horse power.

Every farmer likes the **LIGHT DRAFT LE ROY** because it works so easily, does such good work in a large variety of soil, is easy on the horses, pays for itself in such a short time and saves walking seven miles to the acre. Ask your dealer for a trial or write us.

We are not in a Trust or Combine, but are a strong Independent Co.

LE ROY PLOW CO., LE ROY, N. Y.

When you write advertisers mention The R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page. : : :

Products, Prices and Trade.

PRODUCE RECEIPTS AT NEW YORK.

Week ending April 3.

Butter, lbs.	2,630,000
Eggs, doz.	5,145,720
Apples, bushels	71,340
Potatoes, bushels	102,000
Hay, tons	6,430
Wheat, bushels	230,440
Corn, bushels	11,250
Oats, bushels	290,700

Wholesale Prices at New York, Week Ending April. 3, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Last year the following premiums over contract prices were paid high scoring dairies: April, May and June, seven cents per 100 pounds; July, eight; August, 10; September and October, 11; November, five.

Wholesale prices paid by New York dealers are in some cases 10 cents lower, $1.61 and $1.51 per 40-quart can for B and C grades. A drop of 10 cents per can has been made to restaurants and hotels, those using three to four cans per day now paying 5¼ to 5½ cents per quart.

BUTTER.

The market is overstocked and the price outlook so uncertain that buyers are unwilling to stock up with more than enough for immediate needs. Reports are that the amount on the way is unusually large. Prices are generally one to two cents lower throughout the entire range of qualities, the exception being prime State dairy, of which there is but little offered.

Creamery, extra, lb	24	@	25

Factory	15	@	18¼
Packing Stock	12	@	16

Elgin, Ill., butter market firm at 25 cents.
Philadelphia, western creamery, 26 cents.

CHEESE.

Arrivals of new whole milk are larger. No special price changes are noted, but the market is decidedly unsettled, and the new make will doubtless be lower.

Whole Milk, new, best	16	@	17
Old, best	19	@	19¼
Common to good	16	@	18

EGGS.

Receipts continue large. Arrivals for two days being 2,200,000 dozen. The demand is fairly good for large selected eggs suitable for special Easter trade, but the general bulk of stock is offered under 20 cents wholesale. A few European eggs of medium qualities are on sale at 18 to 18½ cents. Duck eggs selling well but lower, mainly 32 to 34 cents.

White, choice to fancy, large	24	@	25
Common to good	18	@	22
Mixed colors, best	21	@	23
Common to good	17	@	20
Western fresh, white	22	@	24
Lower grades	17	@	19

FRESH FRUITS.

The apple market is weak, mainly because of the large amount of fruit showing scald. The few choice barrelled apples arriving are selling fully up to the top quoted price. Strawberry receipts are increasing, but running good in quality and selling well.

Apples—Spitzenburg, bbl.	4 00	@	5 50

Common to good	38	@	41
Pacific Coast	19	@	22
Old stock	15	@	18
German crop	65	@	70

VEGETABLES.

Prices on domestic potatoes are, 25 cents per barrel higher than last week, but business is light. Very little southern stock arriving; Bermuda $2 to $3 higher. Sweet potatoes very dull, except on a few choice South Jersey. The onion market is badly upset. This week's receipts of Egyptian have been mainly reshipped to other markets, and a cargo of Mexican onions has also been diverted.

*

Several thousand pounds of butter, doctored with flour and water have been seized in Wisconsin. The adulteration was so skillfully done that considerable of the product offered had passed through the regular channels of trade before discovered by an inspector.

*

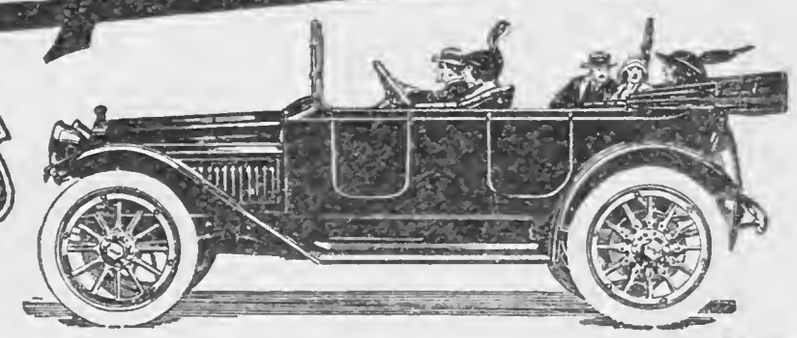
The Burley Tobacco Society, organized five years ago by farmers in Kentucky, Ohio and Indiana, has just passed out of existence, a final distribution of $316,000 having been made to the farmers in the pool. A business of $20,000,000 has been done during the five years. An improved organization, the Burley Tobacco Co., succeeds the old society.

At Shelbyville, Ky., the last sales of the season on the loose leaf market were made March 27, 17,265 pounds going at a range of $1 to $15 per 100 pounds. Sales since December have been 10,039,655 pounds at an average of 10 cents per pound.

*

The experience of a produce shipper putting up a special mark of vegetables is instructive, if not satisfactory to him. For a long time one produce house handled the goods, selling at what might be considered a good price. Then another concern made a strong bid for a trial shipment. They got it, sent a spy to the first house to learn what price was being paid and returned the shipper 10 per cent. more. For a week they got the entire output but fell down on the price so badly that the next week the old concern got the supply as before. This matter of changing commission houses is one of the hardest for a shipper to decide. A change may be desirable, and the idea of "letting well enough alone" is not always sound. But when produce is bringing what an experienced shipper may judge is well toward the top of its commercial value, a safe rule is to go slowly in changing, and have something more definite than the say-so of an interested party who is trying to steal a neighbor's customers.

Imperial



Send for Complete Story of the

Year's Greatest Car Value

DON'T buy an automobile until you send for our folder describing our powerful, economical, beautiful Imperial 32. See the *real*, *actual* motor car quality offered you at a remarkably low price.

You get a powerful 4-cylinder, 40 horse power motor—able to take the steepest hills and travel any road. Big, roomy, luxurious body. Attractive body design like cars costing twice as much. 34-inch wheels; 34x4-inch tires. Left hand drive—center control. Electrically started and lighted. Latest and most complete equipment.

A CLEAN DAIRY BARN With Half the Work

By using a Porter Litter Carrier. It works on our Columbian Steel track, is easy running and will carry heavy loads. Our Perfect Cow Stanchions line up the cows without interfering with their comfort.

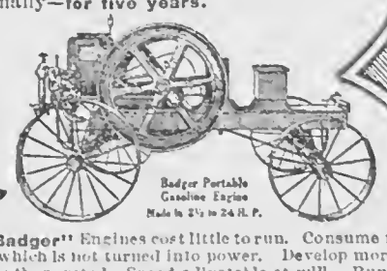
Porter Steel Stalls give perfect ventilation and light throughout the barn and make it easy to keep the cows clean.

We also make the celebrated Porter Hay Carriers and Barn Door Hangers. Send for catalog of our Perfect Barn Equipment.

J. E. PORTER CO., Ottawa, Ill.

You can turn your entire attention to your farm work and forget your chores and incidental big jobs, if you own one of these reliable machines. Simple enough for a boy to run. Dependable and durable. We guarantee every part—unconditionally—for five years.

Badger Farmer's Friend GASOLINE ENGINES



"Badger" Engines cost little to run. Consume no fuel which is not turned into power. Develop more power than rated. Speed adjustable at will. Run smoothly, need no blocking because perfectly balanced. Wearing parts case hardened and made adjustable. Use gas, gasoline or crude oil. Finest power plant for grinding, wood sawing, fodder cutting, churn, separator or milking machines. Made in portable, semi-portable and stationary types, 2½ to 30 H.P. Send for Catalog. Free Engineering Lessons sent on receipt of dealer's name.

The Christensen Engineering Co., Milwaukee, Wis. or J.B.Norton Co., Inc., Distributors, 289 Elizabeth St., Utica, N.Y

MOST MEN WHO SHAVE NEED A GOOD HONE

Here's one which we will send for

One New Yearly Subscription or Three Renewal Subscriptions

(One of these may be a renewal of your own subscription for one year.)

The size of this Hone is 2 x 4 inches. Manufactured of Clay and Rouge pressed and burned in kill, making it very hard.

If your neighbors are not subscribers to the Rural New-Yorker, get their subscriptions. If they are subscribers, get their renewal.

THE RURAL NEW-YORKER,
333 W. 30th St., New York City

SAVES $75.00 A farmer in this State sent his son to take a course in agriculture at

THE NEW YORK STATE SCHOOL OF AGRICULTURE
AT MORRISVILLE, N. Y.

From what the boy learned, he saved $75.00 on this year's fertilizer bills.

THE SCHOOL OFFERS

TO YOUNG MEN: Two-year and short winter courses in Agriculture, Dairying, Fruit Growing, and Poultry Husbandry.

TO YOUNG WOMEN: Two-year and short winter courses in Home Economics, including cookery, sewing, millinery, home nursing, household management, etc. Year trades courses in dressmaking and millinery to fit for professional work.

School has large, well-equipped laboratories, modern two-hundred-acre farm, pure-bred stock, well-trained staff.

Tuition is free to residents of New York State. **Entrance Requirements** are 16 years of age, good character, and completion of 8th grade school work.

For catalogue and information, address F. G. HELYAR, Director, MORRISVILLE, N. Y.

When you write advertisers mention The R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

PUBLISHER'S DESK

Some weeks ago I sold a pair of horses to a city man. He sent a veterinary surgeon to examine them before buying. He paid the fee for examination. The horses were pronounced sound, and the buyer took them at my price. Now the veterinarian comes around and intimates that I ought to give him something on the theory that I sold at a good price and could not have done so if he had not given them a good bill of health. What do you think? Should I give him anything? It has been suggested that, if I refuse, he may be in a position to block a deal some other time. E. F.
New York.

If you were to pay such a demand by a veterinary surgeon, you would be as guilty of procuring grafters as he is of soliciting graft. No custom and no fear of future injustice through him would justify you in bribing him to neglect his duty to his principal. He should have no interest in you and you no influence over him. He is hired to examine the horses and to give an honest opinion of their condition. A conscientious surgeon would refuse your money, if you offered it to him. To accept it would destroy whatever service he could otherwise render to the buyer. He cannot serve two masters. It is true he may do his principal as much injury in wantonly condemning a sound animal as he could do you in that case, but you are not responsible if you do nothing to tempt his behavior. This type of veterinarian is more numerous than we wish it were. We know there are men of high ideals in this profession. The grafter is a scandal to such men, and a menace to the profession. The associations ought to work out the grafters of this type and locate them. Such men are a discredit to any profession in which they secure membership.

Recently somebody offered to be one out of 100 to contribute financially to "Publisher's Desk." I would like to be another one, and pledge $5 each year. Please get the club together. E. P.
New York.

There have been many such offers; but as yet no cash contribution is necessary. Cash sent for this purpose has always been credited up to the sender's subscription, and some of them are paid 20 years in advance in consequence. But you become a charter member of the association to promote honest advertising.

Massachusetts, like Connecticut, has a law making it a criminal offense knowingly to make false statements in an advertisement of any kind. Under that law a conviction has just been secured in Massachusetts for the first time. Not content with this arrangement, a member of the Massachusetts Legislature has introduced a bill to discipline the newspapers that print false advertising. That leads the Berkshire Courier to say: "All over the country are newspapers that refuse doubtful or dirty medical advertising, and there are papers that will not handle liquor advertising. Beyond that papers cannot go far and live." Oh yes, they can. There is THE RURAL NEW-YORKER, of New York, for example. A prosperous, growing, influential publication, as well as one of the cleanest and most exacting as to its advertising in the whole field of publications—much more so than most religious and trade publications—and it continues to thrive and grow. It is at once an example, an encouragement and a rebuke to those papers that take doubtful advertising of any class. THE RURAL NEW-YORKER censors its columns more severely than any official ever would, with the result that it exerts a power for straight business that no similar publication can possibly claim. It is unique, alive, energetic, helpful, and successful. Does that not prove it possible for publishers to put character, discrimination and care into their advertising columns, safeguarding their readers; that it is possible to go beyond the mild exclusion of undesirable business and live?—Bristol Press.

Several friends sent us the above clipping with a request or suggestion to reprint it. At first our sense of modesty suggested to omit it, but we yield to the further consideration that there may be something in the argument to combat the contention that a paper cannot be clean and honest and live, and to support the contention that the cleaner and straighter a publication the better its prospects of prosperity.

I take four farm papers, and now I have got to get THE R. N.-Y., just because the "Boss" (my wife) says so. A. B. W.

We simply wish that a whole lot of other farmers had a similar boss.

Our experience with commission merchants was so unsatisfactory that some time back we eliminated all of their advertising, and have since refused to accept advertising from any produce commission house whatever. We are here, however, to serve our friends as best we can, and so when a New York State subscriber asked us for the names of commission merchants to handle hothouse lambs, we picked out half a dozen of the best we knew with financial rating, and sent the addresses to the subscriber. In response he shipped on the same day two lambs, weighing 27 and 28 pounds respectively, to Phillips & Sons, 277 Washington Street, New York, and two other lambs of exactly the same weight to Read & Garrison, 332 Washington Street, New York. He made no selection and insists that one shipment was exactly as good as the other. Read & Garrison made him prompt returns for $14 for the two lambs on March 6. Phillips & Sons made returns of $7 for the shipment to them. Read & Garrison wrote, "The stock is nice and we can use all that you can ship us." Phillips & Sons reported to us after complaint that the condition of the lambs was not good. This is the kind of thing that shippers have been up against in this market for at least 30 years of personal recollection. The farmers have no redress. The commission merchants fought our bill to create a State Department for marketing farm products. They will probably do everything they can to embarrass and defeat the purposes of the Department, but it is up to the State now to put a stop to transactions of the kind that we have reported above.

We took the Tribune Farmer for 10 years, until they discontinued; but like THE R. N.-Y. very much. Could we not help the paper? NEW READER.
New York.

The friends of the Tribune Farmer have become friends of THE R. N.-Y. There is one way all friends can help. Renew subscriptions promptly and induce neighbors to send for at least a 10-weeks subscription. Get farmers to know the kind of service THE R. N.-Y. is giving them. Then they are their own judge of its value to them.

About the first part of January I ordered a hundred ducks from the Chantecler Poultry Plant of Ulster, Pa. When they arrived some were dead, and others have been dying since, 25 or 30 probably in number. These were guaranteed or represented to be Walton Cumberland White Egg Indian Runner ducks, properly mated and ready to lay this month. Those examined have either no egg or only a little cluster of tiny egg germs. They were represented to be first-class as to size, markings and laying quality, and I paid every cent asked for them. I have received a pen of Waltons which are fine, and equal to photographs seen of prize winners. They came about the same distance in cold weather, and received the same feed and water, and weigh four to five pounds. Now the Ulster, Pa., lot are apparently mongrels with hardly any resemblance to a good Walton, and seven of them, full weight, weighed 17 pounds, about half size, and dirty, altogether different colors from the true Walton. You could never say they were the same breed or any particular breed, as they have varied markings, hardly any alike, but seem to be a Walton cross on some other duck.
Maine. E. E. I.

We wrote the proprietor of this poultry plant with regard to the subscriber's complaint, but we have not been able to induce him to take the complaint seriously or give it the attention which it deserves. Under the circumstances we are under the necessity of withdrawing any endorsement of this concern which may have been conveyed to our readers from the fact of an advertisement of it having appeared in our columns some time ago.

I enclose a receipt for some magazines for which my wife subscribed in August, 1913. I have received only one magazine. Can you do anything for me? W. S. M.
Maine.

Our letters to the International Advertising Syndicate, Boston, Mass., were returned from the post office unclaimed. They claim to have offices in Montreal and New York, but our advice is that the Mr. Gregory who claimed to represent this syndicate was never authorized to solicit subscriptions for the magazines he had on his list. J. J. D.

68 Years of Common Sense in Clothes Making

1846

No. 5130 Blue Serge Special is a suit of clothes made for real men of all ages who want the utmost in solid, substantial value for their money.

It's the culmination of sixty-eight years of common sense in Clothcraft Clothes making—which sounds easy, but wasn't.

It meant studying every little operation from cutting the cloth to sewing on the buttons—to find the one best and shortest way in each case.

Here's another point: Cutting the cloth for twenty suits at once not only means *doing it better*, it also means saving time and money.

That saving gives you better cloth, better lining, better designing.

No other method could have put so much all-round value into a suit like "5130" at $15.00—all ready to put on and wear.

Clothcraft includes many models, both in "5130" and in a variety of other fabrics and patterns. It's the one GUARANTEED ALL WOOL line at $10 to $20.

Write for the new Style Book and personal note of introduction to the nearest Clothcraft dealer.

1914

This label on every Clothcraft Suit. Our signed guaranty in the pocket of every coat.

There is also a fall-weight Clothcraft Blue Serge Special at $18.50 known as No. 4130.

WHEN haying time comes you cannot control weather conditions, but you can make the best of them if you use the rakes, tedders, stackers, loaders, sweep rakes and hay presses sold by I H C local dealers. With a line of I H C haying tools in your sheds you can come out of the least favorable weather conditions with the highest percentage of bright, well cured hay.

I H C haying tools are carried in stock or sold by local dealers who can take care of you quickly in case of accident. It is their business to see that you are satisfied with the I H C haying machines and tools you buy from them. You cannot go wrong if you buy only haying tools with the I H C trade mark.

Write us, and we will give you the name of the nearest dealer handling I H C haying tools, and we will send you catalogues on the machines in which you may be interested.

BUFFALO MARKETS.

There is some new asparagus here, at 12 cents for very small bunches and 75 cents for large ones. Strawberries, Florida-grown, are 50 cents a quart and new potatoes five cents a quart. Eggs are decidedly cheaper, retailing as low as 25 cents for what are called fresh, though some dealers are up to 35 cents. Butter is now higher than eggs, pound for dozen, good grades not retailing for less than 30 cents. Potatoes retail at about 80 cents, the farmer getting 60 cents. Sweet potatoes are still rather low in spite of the late cold weather. The two-quart measure retails for 15 cents, being on a par with white turnips and the cheaper apples, most apples being up to 20 cents for a measure holding about a dozen. The barrel price is now up to $6 to retailers. Fine cucumbers 15 cents each; the imported endive 20 cents a pound. Beets five cents a bunch; radishes two bunches for five cents. String beans retail for 20 cents a quart. Cabbage and onions are still high, but there is new southern cabbage here and prices are not likely to last. The retail is five to 10 cents for smallish heads. Moderate-sized Spanish onions retail for two cents each or three for five cents. Home-grown onions are from $2 a bushel down to retailers. Spinach 30 cents a peck. The price of carrots, parsnips and vegetable oyster remain from five to eight cents a bunch or small measure. Celery is in better appearance than it was in the Fall and sells from five cents up. Southern fruits are still the cheapest of all market stuff. Lemons and oranges are 15 cents a dozen for the smaller sizes and tangarines are as low as 10 cents. Bananas are in great supply at eight cents a dozen up. They affect the prices of other fruits materially. Pineapples retail at 20 cents each. There is a growing demand for nuts in the market and hickories are cheap, $2 or less a bushel to retailers, with walnuts and butternuts $1.75. J. W. C.

THE MISSOURI EGG-LAYING CONTEST

The February report of this contest is quite interesting. A pen of Buff Orpingtons from Springfield, Mo., carried off the honors as the best laying pen for the month. They laid 205 eggs. Tom Barron's pen of White Leghorns lead all the pens in the total number laid, they being 109 eggs ahead of any other pen. The highest individual record has been made by a White Wyandotte from Pennsylvania and a Buff Rock from Missouri, each laying 74 eggs in the three months. The average of all the hens in the contest is 29 eggs, so these two leading hens have laid nearly three times as many as the average hen, and about as many in the three Winter months as the average Missouri hen lays in a year. There are 1,040 hens in this contest, making it far the largest egg-laying contest in the country. They laid 12,391 eggs in February.

COST OF FEEDING.—The hens in the last contest laid about 12 dozen each, on the average, which if sold at 25 cents would bring $3. The hens ate about 33% of grain, and about 38% of dry mash. The feed cost approximately two cents a pound. This made the cost of feeding about $1.42 each, leaving about $1.58 per hen for labor and profit. My neighbor, the editor of the Connecticut Farmer, who keeps about 600 White Leghorns, estimates the average price of eggs here in Connecticut at 36 cents. The 12 dozen eggs computed at these figures would bring $4.32, leaving the balance for labor and profit $2.90 per hen. (This amount, $2.90, is exactly the amount per hen that I made one year in the early days on my farm.) The best pen laid 17¼ dozen; at 36 cents this would be $6.21. This pen ate a little more feed, viz., $1.46 worth, leaving $4.75 for labor and profit per hen. The poorest pen in the contest laid just enough to pay for their feed, leaving nothing to pay for the labor.

This contest has a large number of entries from foreign countries. Below is the record of their best pens:

	EGGS.
White Leghorns, England	610
Buff Orpingtons, United States	501
S. C. Reds, Missouri	466
White Leghorns, New Zealand	341
White Leghorns, Vancouver Island	322
White Leghorns, British Columbia	309
White Wyandottes, Ontario	301
White Leghorns, Australia	278
White Leghorns, South Africa	216

The poor showing of these foreign pens is due to the poor condition at the time they were received, and the severe change in climate. One of the New Zealand pens had to be removed from the contest, and all suffered severely. The same is true of the Australian and South African pens.

The best pens of the different breeds laid as ollows:

	EGGS.
WHITE LEGHORNS.	
Tom Barron, England	610
BUFF ORPINGTONS.	
Bermuda Grass Orp. Yds., Texas	501
WHITE WYANDOTTES.	
Penn. Poultry Farm, Pennsylvania	495
S. C. REDS.	
Fred A. Bentz, Missouri	466
Anconas, Missouri	443
White Orpingtons, Ohio	434
Buff Leghorns, Missouri	433
Campines, New Jersey	426
Buff P. Rocks, Pennsylvania	419
White P. Rocks, Arkansas	409
Barred Rocks, Illinois	401
R. C. Reds, Missouri	393
American White Leghorns, Pennsylvania	368
"Rhinelanders," California	363
Black Orpingtons, Missouri	354
Silver Wyandottes, Iowa	348
Buff Wyandottes, Missouri	343
Black Langshans, Missouri	334

The report is very complete, showing the record of each of the 1,040 hens in the contest, but too long for these columns. GEO. A. COSGROVE.

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

DO YOU NEED FARM HELP

We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. TRAINED NURSES—Hackensack Hospital Training School has vacancies; applicants healthy, good character; age 20 to 30; two years' course. Apply SUPT. MARY J. STONE, R. N., Hackensack Hospital, N. J.

POULTRYMAN WISHES POSITION—Married; thoroughly competent; 15 years' experience; able to manage large plant; Cornell training; will build up a plant or take entire responsibility of existing plant. POULTRYMAN, Box 12, Manorville, L. I.

WANTED POSITION—Young couple, no children, wants position on up-to-date farm; experience in dairying and general farming; wife willing to assist house or board help; state wages. Address DAIRYMAN, HORNSTRA, Woodside Farm, Perkasie, Pa.

EXPERT POULTRYMAN desires position as manager; scientific training and thoroughly practical; experience covers all lines; young American, single, well educated; capable, energetic and honest; no tobacco or intoxicants; best references; only first-class proposition considered. WEWAPPO POULTRY FARM, Midvale, N. J.

MAPLE COVE FARM—Products direct to Consumers. ROUTE 24, Athens, Pa.

FOR SALE—Strictly fine Maple Syrup, best quality, my own make; $1.25 per gallon, f.o.b. Dewittville, N. Y. A. M. RHINEHART., R. F. D. 44, Box 18, Dewittville, N. Y.

FOR SALE—Glenwood Range, with water back; almost new. Also two Prairie State Hovers, complete. Address MOODNA FARM, Mountainville, N. Y.

FOR SALE—Three Hall Colony Brooders, good condition; reason, installed Hall hot-water system. MAPLE HILL POULTRY FARM CO., Richfield Springs, N. Y.

FOR SALE—My farm of 245 acres; particulars address R. N. FAIRBANK, Bernardston, Mass.

93 ACRES and 12 ACRES—Two acres in grapes. Inquire N. M. KISTLER, Emporia, Va.

WANTED—Large equipped poultry farm; fertile level soil; near large city; reasonable. SCHAUB, 2004 Madison Ave., New York.

170 ACRES—Good dairy farm, good buildings, timber and muck land suitable for onions or trucking. KIDDLE, Williamsfield, Ohio.

WANTED—Good 50-acre farm for fruit, with buildings, water; state price and full particulars; no agents. G. H. S., 405 Fourth St., Brooklyn, N. Y.

FARM FOR SALE—Good for raising poultry, fruit and berries of all kind; 1 horse and 1 set of tools left on farm. Owner, F. SEAMAFO, Hammonton, N. J.

FOR SALE—80-acre irrigated farm in Idaho fruit belt, close to electric car; telephone and R. F. D.; live stock, machinery; easy payments. Address owner, G. PRIMBS, Caldwell, Idaho.

WANTED—Small dairy and fruit farm, 25 to 100 acres, good tillable soil, conveniently located in Orange, Ulster, or Dutchess counties; terms cash. Address L. B. S., care R. N.-Y., 333 W. 30th St., New York.

FRUIT, TRUCK, POULTRY FARM FOR SALE—36 acres, excellent location and market; good buildings; all kinds fruit; strong soil; with or without stock, etc.; buy direct, saving commission. HOMER TWEED, Quakertown, Pa.

120 ACRES, NEW MEXICO—Grows anything; fruits, vegetables, Alfalfa; delightful climate; abundant pure water; near prosperous county seat and railroad; price reasonable. GEORGE SUMMERS, Inter-Southern Bldg., Louisville, Ky.

MODEL POULTRY FARM—Successful business proposition, fully equipped with thoroughbred stock; 35 acres; capacity 3,000; large dwelling, mile from railroad; profits will return 20 per cent. on investment; $15,000, part cash. BOX 256, Beverly, N. J.

FOR SALE—Successful poultry plant, location convenient to market; modern equipped buildings housing 900 hens; must be seen to be appreciated. Price, reasonable, terms. Address BARGAIN, care R. N.-Y., 333 West 30th St., New York.

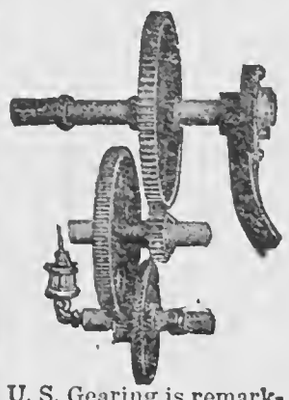
FOR SALE—Boarding house and dairy farm, 128 acres; stables for 44 cows; milk station on farm; house has 30 rooms; accommodates 50 guests; modern conveniences; telephone; price $11,000. Write for photos. and terms. Address OWNER, Willow Brook Cottage, Wallkill, N. Y.

117¾ ACRE ONEIDA COUNTY DAIRY FARM. $4,900; $2,500 cash; balance easy terms; brand new 10-room house, finished oak and cherry, natural; water and sink in kitchen; new cement basement barn, stanchion 20 cows; hay track; plenty other good buildings; enough split wood for about 2 years; $500 worth new, heavy oak furniture; all tools, machinery, etc.; 3½ miles to city and railroad; on crushed stone road. Wish to hear only from those interested. Address owner, N. L. HOOVER, R. 5, Camden, N. Y.

Repair Bills Go
when
The U. S. Comes

How much have you paid out for repairs on your separator in the past five years? Would you like to get rid of that kind of a tax?

Every Part of the 1914 Model
UNITED STATES
CREAM SEPARATOR



U. S. Gearing is remarkably simple and built to last, all enclosed in solid, one-piece frame.

has material so good, workmanship so expert, and is so well provided for as to lubrication that **it lasts.**

Simplicity

The United States Cream Separator excels all separators in **greatest simplicity** and few parts, which, to give lasting service have the most perfect arrangement in relation to each other. Frequent adjustments are never necessary. Write for our handsome, new catalog.

VERMONT FARM MACHINE CO.,
Bellows Falls, Vt.
Chicago, Salt Lake City, Portland, Ore., Los Angeles

$1.50 Worth of Goods for $1.00

Here's your chance to profit by the unavoidable misfortunes of others. Over 500 big manufacturers of fine merchandise nearly went into bankruptcy this year because of hard times. They made more goods than they could sell. We bought their surplus for spot cash at one-third less than cost to manufacture. And we will sell you their overstock of

Brand New Goods at Less Than Cost!

We saved 50 cents for every $1.00 spent and we will hand you that fifty on every dollar you spend with us.

Our profits of 4% are the same as ever. We figure that it is better business for us to give our customers *all* of the *saving*, because our wonderfully low prices will sell over four times as many goods as ever before.

Prove the saving or send the goods back. Compare our goods and prices with those of the local stores. If we don't save you Fifty Cents on every Dollar you spend,

just send the goods back and we'll refund your money in full.

But don't delay. It is almost certain that we won't be able to replace the goods listed in our new catalog without paying at least 50% more for them.

Notice to Storekeepers

We are receiving a large number of orders from storekeepers with requests to bill our goods on 30, 60 and 90 days time. Our small profit makes it impossible to do business on anything but a *strictly cash-with-order basis*. Kindly do not ask for credit. Our prices to you are *net*, as printed in our catalog. No discount to anyone under any circumstances.

The Manufacturers' Outlet Co.

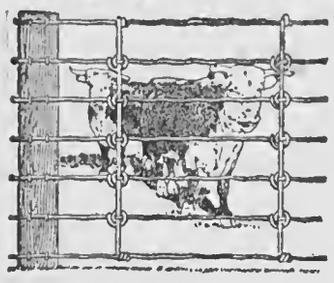
If You Want These Goods at These Prices

ACT QUICK! Our stock is always changing because we only buy manufacturers' overstocks. That's why our prices are so low. When we buy cheaper, we lower prices, but when we have to pay more, we have to charge you more.

Goods are cheaper today than we have ever seen them. Send in your order while we have these low priced goods to ship. Don't be too late.

MAIL THE COUPON TODAY

Get the Fencing that Lasts



If you want a fence that will hold up under all conditions, don't buy before you get our big fencing sheet.

We have several thousand rods of the best grade of fencing that is made. Heavy pure steel wire, triple galvanized. Patent lock joint that cannot slip and will not rust like twisted or welded joints. This fencing would cost you more money direct from the manufacturer than we ask for it.

Get your order in quick before our stock is sold out.

Every piece of wire in these fences goes through a patented process which leaves a perfectly smooth surface for our heavy galvanizing.

Our big fencing sheet will tell you the best fence to use and give you a price per rod laid down at your railroad station. Our list of heavy all No. 9 fences will last a lifetime if stretched properly.

26-Inch Hog Fence, 17c Per Rod; 32-Inch Hog and Sheep Fence, 18c Per Rod; 4-Foot Field Fence, 22c Per Rod.

Send for Special Sheet! Get Our Delivered Prices!

OUR GUARANTEE

Sure you can have goods on trial. If you find that everything is not exactly as we claimed, *fire them right back and we will refund your money by return mail.* We don't want one dissatisfied customer, and every article we sell is fresh, clean, up-to-the-minute. It is as easy to buy from us as from your home store. Just sit down and if it is not handy for you to get a postal or money order, send your personal check and enclose with it one of our order blanks. We'll do the rest.

RUBBER ROOFING, 59c

We take the entire output of remnants from four large factories. Just think of it—a rubber roofing at 59c a roll, the lowest price ever quoted for this quality roofing. Guaranteed to resist heat, fire, water, snow, hail and acids. No painting is needed; easy to lay as a carpet; no tools required but hammer. This roofing in the 2-ply comes at 83c per roll.

Queen City Rubber Roofing

This is the best rubber roofing made. Only pure asphalt and wool felt is used, which are acknowledged the best water and weather proof roofing materials on the market today.

1-Ply, Guaranteed 5 Years, $1.03; 2-Ply, Guaranteed 10 Years, $1.30; 3-Ply, Guaranteed 15 Years, $1.60.

Other grades on our big delivered price sheets.

STEEL ROOFING

Owing to slack business this year several large steel mills are heavily overstocked. We have taken the surplus of four of them, and our prices on steel roofings are the lowest in years. Don't think of buying any of this material until you have seen our delivered prices. For quality and prices we beat the world on steel roofing.

Get Samples and Delivered Prices

Best Paint, $1.06

Get your paint now, so as to have it ready when you need it in the spring. We offer to the first comers 3,500 gallons of specially mixed "farmers' paint," made to stand the extra hard wear that paint undergoes on the farm. Don't miss this opportunity. Order quick if you want the best farm paint ever made, at 44c less than you would have to pay at wholesale.

Reports from 176 of our customers show that Buffalo Farm Paint will cover 525 sq. ft. of wall or floor. Other paints of equal service cover only 400 sq. ft.

Our paint department is one of the largest in the country, and includes brushes, stains, varnishes—in fact, all painters' supplies, at bargain prices.

House Paint, $1.06 Per Gallon, in 5-Gallon Cans; Barn Paint, 78c Per Gallon; Cold Water Paint, inside, 6c Per Pound—outside, 9c Per Pound. SEND FOR LARGE COLOR CARD.

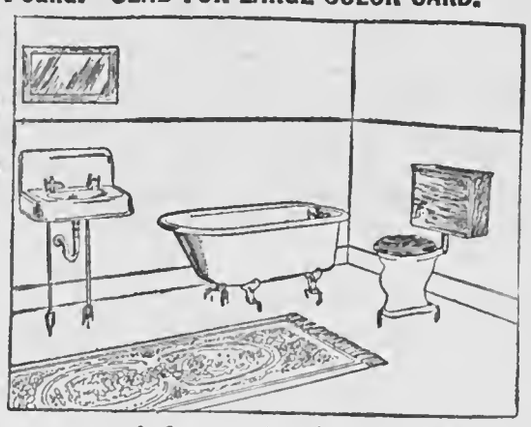
Wall Board

This wonderful substitute for lath and plaster is becoming so well known that no further description need be given. Improved Buffalo Wall Board makes your home warmer in winter and cooler in the summer. Easy to put on. You just tack it to the studding or over old plaster and paper. Weighs so little the freight is practically nothing. Send us your room plan and we will give you a price delivered to your station. We have over a million feet bought, all of which we offer at $2.35 per 100 square feet or $22.50 per 1,000 square feet Don't delay—write us today.

Bath Room Outfits



Sanitary plumbing today is a vital question all over the country. For years we have been installing complete outfits everywhere. Every piece, from enameled ware to pipe, that leaves our warehouses is guaranteed perfect. You don't get chipped or seconds when you buy of us. No mechanic is needed to install our outfits, as we can furnish all iron pipe connections and full instructions.

Let Us Install Your Water System

We make a specialty in water systems. Just tell us you want one and our engineers will do the rest, giving you size and all instructions for installing FREE. Our system is made extra heavy throughout, and you can rest assured, with a Buffalo Water System in your home, you never need worry.

Our Engineers Furnish All Plans Free

MILLWORK and LUMBER

Everything in the building lines can be found in our BARGAIN BOOK. We will sell you material for an entire building, freight paid to your town, and give you a saving big enough to pay the entire labor cost of building. All A-1 new stuff and all guaranteed.

In this book all the material is listed at prices your wholesale dealer would have to pay. Don't be misled about freight charges, as we will give you delivered prices to your station on everything and show you where you can save big money.

Our building department includes nails, shingles, lath, siding, hardware, doors, windows and all inside and outside trim. (45)

RED-TOP IN NEW YORK.

A Grass for Sour Land.

CONTRASTED WITH TIMOTHY.—The place of Timothy in New York agriculture is so important and prominent that the value and importance of Red-top is often overlooked. On the one hand, no one will argue that Red-top can successfully compete with Timothy, where conditions are favorable for the latter. Its yield per acre is less and the market prefers Timothy, for which it will pay a higher price. It lacks in palatability when compared with Timothy. On the other hand, much of our land will no longer grow Timothy, due to acidity and poor physical condition generally, in addition oftentimes to an actual depletion of soil fertility. On these lands Red-top is indispensable. Moreover, in many of our permanent pastures, where the conditions of soil, moisture and temperature are unfavorable, Red-top is again of greatest importance.

SPECIES OF RED-TOP.—Although there are a relatively large number of rather distinct species of this grass, three are of greater agricultural and commercial importance. The first of these more important varieties is Agrostis alba vulgaris, commonly known as "Red-top," due to the reddish appearance of the head or panicle when ripe. When this species first comes into bloom it gives a silvery appearance, but later becomes reddish, giving rise to its common name of Red-top. It is largely used for hay. The stem is the largest and coarsest of the three common species. Under very favorable conditions it will yield two tons per acre, although the yields throughout New York State, where it is grown, is probably not more than one ton per acre. The second species considered is Agrostis stolonifera, commonly known as "Bent" or "Creeping Bent" grass. Its stem is not so large, but finer than the Red-top. It is a very fine grass for permanent pastures, and would not be profitable to grow for hay where common Red-top could be grown. The cattle pasture on it readily while green and succulent, although its palatability decreases rather rapidly when it ripens and becomes dry. It spreads itself over the ground rapidly, and produces a fair amount of green pasturage and a good sod. The third species is Agrostis canina, commonly known as Rhode Island Bent, or Brown Bent grass. It is shorter and finer than the creeping Bent grass, and is used for pastures and lawns. Where conditions are favorable for the growth of the Bent grass for pasture purposes, it should be grown rather than the Brown Bent. Insomuch as the Brown Bent can adapt itself to greater extremes than the Bent or Creeping Bent grass, and forms a denser sod, it persists as a valuable grass where conditions are unfavorable to the Creeping Bent grass.

CHARACTERISTICS AND ADAPTATION.—One of the common characteristics of the group is that the Red-top grasses are stoloniferous. By this we mean that new plants arise from the underground root system, and thus it spreads itself more rapidly than a bunch grass, a common example of which is Orchard grass. New plants may arise from a joint of the grass stem, particularly the lower joint, by coming in contact with the soil, due to the bending character of the grass plant. It takes root in the soil, sends up new stems and gives rise to new plants. This habit of reproducing itself makes it a good sod-forming grass, much better than Timothy, and so makes it valuable in pastures where a strong sod, that will resist injury from tramping, is necessary. This stoloniferous habit is most developed in the Brown Bent grass, least developed in the common Red-top, while the Creeping Bent grass is intermediate between the two.

SOIL REQUIREMENTS.—Red-top will grow on

WESTERN NEW YORK SPRAYING SCENE. THE RIGID BARREL PROTECTS THE SPRAYMAN. FIG. 234.

acid lands, though it does not prefer them. This single characteristic or power to adapt itself to such condition of soil is of great economic importance in New York State, because so much of our land needs lime. Timothy will no longer grow. Red-top takes its place as the next best grass, and becomes of first importance in such regions. As soon as the lands are limed, the more valuable Timothy grass can again be raised. Until then, Red-top will be the most valuable grass that can be grown. Moreover, this adaptation to acid soil conditions is more marked in the Red-top used for hay than in either of the other species, although all three are resistant to soil acidity. Red-top is also adapted to wet conditions. It will produce a crop of hay on soils too wet for Timothy and Red clover. When grown under such conditions the hay is apt to be coarse, and is not considered so desirable or valuable. While adaptation to wet lands is a characteristic of the Red-top, the Brown Bent grass is adapted to dry lands, and is more resistant to drought. This makes the Bent grass—both Brown and Creeping Bent—valuable for pasture plants, particularly where there is a tendency to regional or seasonal droughts. The bent grasses are more resistant to the bad effects of high temperatures than many of the more valuable pasture plants, such as Kentucky Blue grass. Where drought and high temperatures occur, if not too extreme, Bent grass, therefore, offers an important means of utilizing much land that otherwise would be of little value. These adaptations to acid soils, wet soils, and to dry hot climates are, accordingly, of much importance in choosing seeds and grass mixtures in order to utilize best such lands, and to assure the best returns.

RED-TOP AND TIMOTHY.—Where conditions are favorable for Timothy, Red-top will give way to it. Red-top will respond to the application of lime, as well as Timothy does. Experiments have shown that, on lands that have been limed and seeded to both Red-top and Timothy, the Timothy grew at the expense of the Red-top, and that this latter gradually ran out as the Timothy increased. It is reasonable to expect that where lime is now the limiting factor in the production of Timothy on New York lands on which Red-top is now grown, such conditions may sometimes be reversed. Whether such conditions as these can be changed depends largely on the amount of lime required. It is not at all impossible that some lands require more lime than can at present be afforded. We must therefore, for a time at least, either cultivate our fields at an actual loss, due to the cost of lime to correct the conditions of soil and increase productiveness, trusting to get increased returns later, or continue to raise Red-top and be compelled to be satisfied with the smaller returns from it. Where the limiting factors are not lime as assumed above, but drainage, etc., such conditions present, of course, a different problem.

MAINTENANCE OF SOIL FERTILITY.—Red-top plays the same part in maintaining the present fertility of the lands that will grow it as Timothy does to the land on which it is grown. It offers a means of putting organic matter in needy soils. Such soils, that will only grow Red-top and are too acid for Timothy and Red clover, would become unproductive much faster were it not for the roots and stubble of the Red-top which are plowed under. It is the mainstay of the hill lands, especially in Southern New York, in restoring humus to these soils. What may be said of the relation of Red-top to the hay lands of New York may also be said of the pasture lands that are occupied by the Bent grass. The utilization of these grasses in the permanent pastures that will no longer grow the more valuable pasture grasses, is highly important in maintaining the organic content of such soils, and may be the means of reclaiming them, other conditions being equal, to more valuable pasturage production.

ITS PLACE IN THE ROTATION.—In some counties its place in the rotation is an important one. Where potatoes are grown as the principal cash crop it is especially so. Red-top three years, potatoes and oats is a common rotation. The Red-top may be cut two years, then manured, and instead of harvesting the hay the third year, the grass is plowed under, and the land planted to potatoes the year following. Potatoes are followed by oats. It should be noted that all three crops are more or less adapted to acid soil conditions, especially potatoes. Where potatoes are largely grown, such a rotation, and the place of Red-top in the rotation, may assume even greater importance.

Ordinarily we would prefer Timothy, Alfalfa, Blue grass and Red clover, and others of the more important forage plants, to Red-top. But in many cases our soils are in such a poor condition of fertility and productivity that we have no longer any preference in the matter. When we understand these conditions, and the wide adaptation of this Red-top group of grasses, we begin to appreciate more fully the importance and value of these grasses in New York State under our present conditions.

J. H. REISNER.

THE NEW YORK GAME LAWS.

The article on page 170, "A Farmer on Fool Laws," might be the text for a long sermon, to which the farmers of this region would respond a hearty amen. The only protection or aid we are allowed to give wild pheasants is to feed them. If they should go into a building to roost and a door should blow shut so as to fasten them in, the owner or occupant of the land would be liable to fine or imprisonment. On the other hand, if we put out grain or other feed for them it is sure under the present trespass laws that some party of game hogs will come along and kill them all off in a few minutes' shooting. It is a common thing for a party to start out in an automobile and kill 10 or more pheasants per man in a day's shooting (the legal limit is three males in the open season). Many of these people carry wire cutters, so that they will not be put to the trouble of opening gates. The worst of it is that the owner of the land has no redress. If he happens to be so fortunate as to get the names of the offenders he must institute a civil suit, and then is decidedly lucky if he is awarded six cents damages, and so escapes the court cost of the action. If the laws were so changed as to make it a misdemeanor to trespass on posted lands without written permission of the owner or occupant and if farmers were allowed to keep in partial domestication any game or fur mammals or birds on written notice to the local game warden, or on payment of a *reasonable* fee, and the game warden were given the powers of a trespass officer, the enforcement of the laws would be much easier; the sale of hunting permits would reimburse the farmers for their trouble and expense in caring for the game, the game hogs would be curbed in their activities; the amount of game on State and unposted territory would be greatly increased by drift from posted lands, and the average town man would be assured that for a reasonable price he could get within shooting distance of plenty of game.

At present pheasants are practically not protected at all in this part of the State. This is no fault of the local game warden. He must cover a territory about 30 miles long and 10 miles wide, including four or five extensive bays and marshes. Last Fall, in addition to this, he was busy for about two months collecting fish eggs for the State hatcheries. During this time the shooting was almost as continuous as on a rifle range that is being used by a regiment. This may be contrasted with the condition of fish protection on the largest bay under his control. Fishing is permitted with licensed nets in this bay during certain months, provided specified game fishes are not taken, or are returned to the water without injury. No application for a net license is granted unless it is approved by the game warden. This has practically stopped illegal fishing in the bay, as those who formerly were able to escape prosecution because of the difficulty of getting sufficient evidence to convict are now anxious to avoid the appearance of evil because they know that if the protector gets the idea that they are fishing illegally their license will be revoked or held up until they can prove to his satisfaction that they have violated no laws. The proposed changes in existing laws would have as salutary an effect in the case of land game. Under the present system any farmer who makes any attempt to protect or increase the game on his land, whether posted or not, is a fool who is simply catering to the pleasure of a gang from some nearby town, who will come along with an automobile, a supply of whiskey and a battery of pump guns and automatics to make a target of every living thing on the farm.

A good example of the result of the present laws is on our farm. We are working a tract of land nearly two miles long, practically surrounded by woods or marshes, on which a thousand pheasants could be raised every year without serious damage to any crops. Last year was a good season for the birds, and there were certainly more than a hundred brought to maturity. Of these we got one and others killed most of the remainder. There is a loose flock of perhaps 25 wintering partly on our land, and most of them are likely to survive, as the hunting season is now closed, and there is no further excuse for the presence in the woods of the man with the gun. There are also about a dozen ruffed grouse or partridge in the woods about us. If we had any assurance that the State would protect us we would feed these birds and give them shelter when needed, but we shall not do so as long as we know that we can never get any benefit, but will only be exposing ourselves to damage.

Wayne County, N. Y. ALFRED C. WEED.

RECORDING CLIMATE.

There are about 4,000 coöperative observers well distributed over the United States who keep a daily record of the weather and make a monthly report to the section directors. Each State has a section director who is an official of the Weather Bureau and has charge of the instruments loaned to the cooperative or voluntary observers who are under his direction. The local observers receive no pay for this work, but it requires not to exceed five or 10 minutes each day, and all supplies are furnished, such as pencils, report blanks, carbon sheets, franked envelopes, memorandum blanks and franked cards for reports to the local press. The monthly reports are made in triplicate; one is retained, two are sent to the section director, who keeps one and sends the other to the National Weather Bureau Office. These reports supply data for the Monthly Weather Review, the Annual Report of the Chief of the Weather Bureau and the Summaries of the various sections of the Climatical Service. The instruments supplied to the coöperative observers are a standard rain gauge and support, at the right hand of the picture, and self-registering maximum and minimum thermometers mounted in a thermometer shelter shown in foreground of Fig. 236. This thermometer shelter is so built that it keeps the thermometers dry, protects them from the direct rays of the sun and radiations and reflections from the ground, but permits free passage of the air. The shelter should be about four feet above the ground, preferably one rod from buildings, in the open, but not exposed to molestation by stock or persons. The shelter shown in the picture is protected by four posts to which are nailed some strong slats, so that the stock can rub against the posts without jarring the thermometers, since these posts and slats are not connected with the shelter in any way.

The weather data desired are the highest and lowest temperatures, precipitation in inches and times of beginning and ending, snowfall in inches and depth on ground, directions of wind, condition of sky and various phenomena such as frosts, sleet, thunderstorms, high winds, lunar and solar halos and coronas, auroras, etc., tornadoes, fogs, etc. The instruments are read and records made once a day, preferably about sunset, and at the same time each day. After reading, the rain gauge should be emptied and both thermometers reset, the shelter closed and locked. There are somewhat less than 200 forecast stations which are supplied with expensive recording barometers or barographs, thermographs, psychrometers or moisture gauges, rain gauges, wind vanes and anemometers, and which transit the data each day as taken, by telegraph to the Weather Bureau at Washington, where a daily weather chart and forecasts are made up and transmitted in turn to each station issuing daily weather maps, forecasts, flood, storm, ice and cold-wave warnings. These forecast stations are usually located in some large city near or on top of a government building, and are in charge of salaried men who through training and experience are well fitted for their work.

The work of the coöperative observer is rather interesting and if located along a much frequented walk the instruments are but little bother, even at busy times. The instruments are standardized and so are of great accuracy; therefore it is more satisfactory to read them than non-standard instruments. You have the satisfaction of knowing they are truthful, and besides you are sure of the highest and lowest temperatures. These instruments and accessories would cost $10 or $12, if purchased, and the Weather Bureau still retains their ownership, though they are loaned to the observer so long as he continues to record his observations and make his reports.

W. E. DUCKWALL.

Ohio.

Seeding Red Clover.

On page 292 you advise one of your readers to sow clover seed by scattering it on frozen ground. That was the practice years ago, but the up-to-date farmer uses a 20-disk drill, with disks four inches apart, and drills his clover seed. It takes only four quarts per acre and insures a stand with good seed. The old method of scattering clover seed on top of the ground is not only wasteful, but it is a matter of luck if one ever sees it again. F. W. OKIE.

Virginia.

R. N.-Y.—The advice was given in a case where only a small seeding was to be made—too small to make the ownership of a drill profitable. On a large scale the plan suggested is right.

FIGHTING FROST WITH FIRE.

PART I.

NEED OF IT.—We have had many questions about plans for fighting frost. In the West and South a good many fruit and vegetable growers have adopted the plan of providing fixtures for artificially heating the orchard or garden when the mercury goes too low at blooming time. Some of these growers report great success with their experiments, and evidently Eastern fruit growers are disposed to try it. Some of them have already done so. Here, for example, is a note from A. T. Henry of Connecticut, and there are others who have tried very much the same thing.

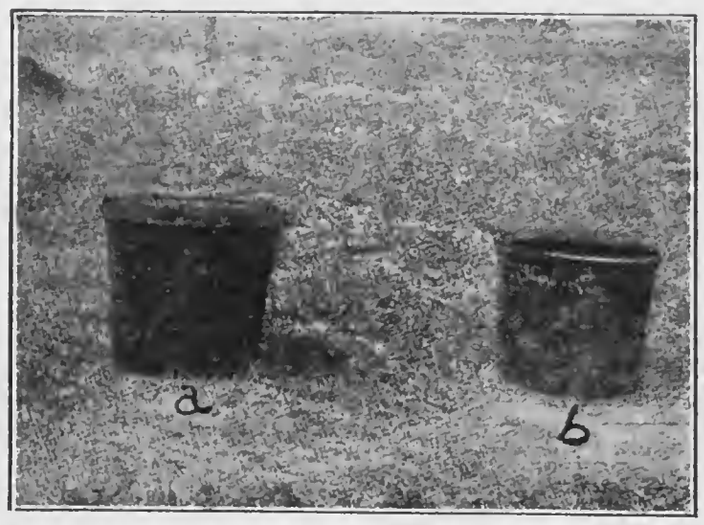
The article on orchard heaters is the most interesting I ever read. We have some of our own make, from powder cans, using excelsior, charcoal above, to start the coal burning. We have about 3,000. In an experimental way we raised the temperature seven degrees one night; had them out in orchard last Spring, but temperature did not go low enough.
Connecticut. A. T. HENRY.

It is very difficult to obtain actual facts from Eastern experience. All we can do is to make a fair statement of what Western men have done. Generally speaking, this plan of frost fighting has been most successful in protected places. For example, there may be a pocket of land, a rather low valley surrounded by higher ground. Naturally the cold air would roll into this pocket and increase the danger from frost. There would also be less danger that the wind would blow the heated air out. Thus many of the great successes in this method of preventing frost have been worked out in these low places, for there the heat from the fires and the smoke and smudge from the fuel are held around the trees.

BEST SITUATION.—A situation, too, where a strong wind-break stands to ward off the wind, will greatly help in work of this kind, and a good many Western growers now consider this in their planting, and make sure that wind-breaks are started so as to ward off the prevailing winds. A good many of our Eastern orchards, especially those of peaches, are purposely planted upon high hills, on the theory that these locations are less liable to frost, and that the wind and thorough air drainage will carry off many disease germs. Such locations are not well suited to frost fighting, for should there be a wind with the cold air, it would be almost impossible to hold the heat and smoke around the trees. The usual plan is to start little fires all through the orchard.

BURNERS USED.—In former years small piles of wood, brush or sawdust, or even soft coal, were used for this purpose. It has now been found better to use pots, or burners for this purpose. There are many types of these pots. In some cases ordinary kegs, used for carrying metal paint, are used, and they do excellent work when provided with covers. A picture of the form of pot which proves very successful with John Bland, of Missouri, is shown at Fig. 235. These pots have covers, and are known as the lard pail type. The cover may be raised more or less to increase or diminish the flame from the fuel. In other cases larger rectangular pots are used, which are divided into two compartments, one holding the burning oil, and the other forming a reservoir to hold an extra supply of the oil. What is needed is a fire which gives off a large amount of smoke. This heavy cloud of smoke hanging over the orchard tends to prevent radiation of heat, and thus the heat from the fires will remain longer in a protected orchard. In former years this fact was recognized by those who used slow smoking fires of wet straw. One of the earliest reports of experiment in California told of a man who drove slowly through his orchard, up and down the rows, with a large metal tank on wheels, this tank containing wet straw covered with damp manure, and a fire at the bottom which sent off great volumes of smoke and vapor. Any kind of a pail or keg that will hold the fuel, and can be regulated so as to make a slow and smoky fire, will answer. There may be cases where soft coal, or other material will make a cheaper fuel, but generally speaking a thick fuel oil has given best satisfaction. The oil heaters are quickly filled and easily lighted. The flame can be easily regulated, and the fuel supply easily kept up. The coal heaters are slow in starting, throw off very little heat at first, require more labor for filling and handling than the oil, and cannot easily be extinguished except by dumping out the contents.

EQUIPMENT.—The general method of handling these oil heaters is first to provide a reservoir, at some elevation near the orchard, and keep it filled with the oil. In most cases a pipe runs from this down to a level with the orchard. A tank on wheels is used to carry the oil. This tank is driven under the pipe and filled from it. It is then driven through the orchard, the oil being taken out in pails and poured into the heaters all ready for use. In many cases these growers fill their heaters early in April, and keep them constantly filled until all danger from frost has passed. There are some seasons where it is not necessary to start the fires at all. In that case after danger has passed these oil heaters are emptied back into the tank and the



POTS FOR FIGHTING FROST. FIG. 235.

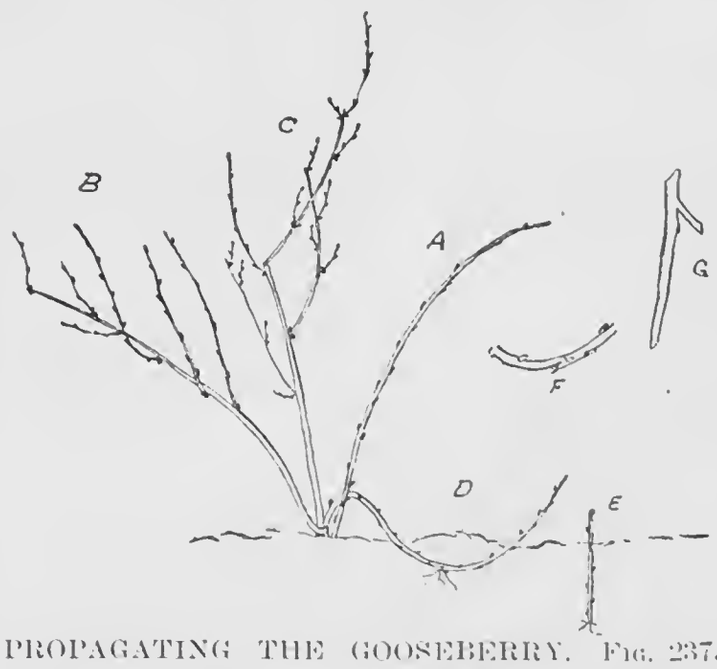
oil turned back into the reservoir. The rule is to place these heaters from 20 to 25 feet apart each way. The usual plan is to put them in rows between the trees, rather than close to or under the trees. On the windward side of the orchard a row of the pots will be placed about 10 feet apart, and 15 or 20 feet from the outside row. The heaters are placed in this way largely to make it easier for filling, lighting or extinguishing.

GROWING CURRANTS AND GOOSEBERRIES

There are many ways to propagate these fruits. If new varieties are wanted seeds are used, which are washed from the ripe fruit and planted in the Fall, or stratified until ground is fit for planting in

SHELTER FOR OFFICIAL THERMOMETER. FIG. 236.

Spring. If one desires to propagate a certain variety it may be done by separation, layering or cuttings. Many times these fruits will send up suckers, which if separated from the plant with some roots attached, make good plants. Layering is a very easy means of propagating. Cuttings are also easy to start, and though a large percentage may fail if carelessly handled, it will be the quickest



PROPAGATING THE GOOSEBERRY. FIG. 237.

way to increase the plants. The drawing, Fig. 237, shows a one-year-old shoot of gooseberry at A. This is the proper age to use for cuttings and layering, although the two-year-old shoot at B may be layered, but would not be apt to give as good a plant as the one-year shoot A. The three-year-old shoot at C is not desirable for either fruiting or propagation, and should be removed to give the younger wood a better chance. D shows a one-year-old shoot bent down and covered with earth. The tip is left uncovered, and usually a cut is made on the under side at the bend, as shown at F. This hastens root formation. The cut should not be made too deep. A small forked stick, as shown at G, is handy to hold in place the shoots that are too stiff to be held down by the soil placed over it. The layers should be laid down in the Fall or Spring, and left in place till the following Fall, when they may be removed to permanent quarters.

Cuttings should be taken from the one-year shoots such as A. Wood for cuttings should be cut with knife or shears, as broken ends seldom heal as well. The cuttings should have from eight to 12 eyes or buds, and are best taken in the Fall, tied in bundles and buried with butts up till Spring. The cuttings should be entirely covered, and in a well-drained place. The object in inverting the cuttings is to give the butts a chance to callus without starting growth in the tops. In the Spring the cuttings must be dug up as soon as the ground will permit, and are then ready to plant in rows about two or three inches apart in the row. Only two or three of the upper buds are exposed. The cuttings should be given clean culture. The plants should be removed to the permanent quarters the following Fall.

If it is not convenient to take the cuttings in the Fall, they may be taken in the Spring and planted in the rows the same as the trenched cuttings were. The age of the parent plant will make little or no difference to the cuttings, provided these are strong one-year-old shoots. Great emphasis should be given to the fact that cuttings should be taken from the best plants. If the plant is weak, if poor in its habit of growth or subject to disease more than the others, it should be discarded so far as propagation goes. R. B. G.

A FARM FERTILITY PROBLEM.

I am a beginner at farming and have a run-down farm that I wish to restore to a high state of cultivation. I have carefully read and studied farm papers, also books, on the above subjects and should like some of the successful readers of THE R. N.-Y. to give their idea as to which of the above methods would be best for a beginner.

My means are limited and I must, therefore, proceed carefully. I intend to make hay for market the main crop, potatoes next, chickens and small and large fruits, and raise whatever else can be consumed by the family. Stock, it seems, would be a long road to fertility of the soil, and the means of a good living. It would mean buying scrubs—as I could not afford purebred—and it seems absolutely foolish to buy scrubs when the cost of milk production by scrub stock, according to experiments in New England, is more than the receipts from same. Nearly all the farmers in my town have inferior stock and cut their hay, feed it, buy high-priced grain, have poor pastures that run out in hot weather, and sell their product at a loss, according to authorities. They have the labor of carting out manure, carting in hay, and keep carting in and out to keep such stock, and usually do a little teaming for others on the outside, to enable them to scratch out a living. Some of their farms are for sale and others are giving up the cows to try other crops, while the rest plod on in the same old way.

Having read that cows must give so many pounds of milk in order to pay a profit, and knowing that I cannot afford purebreds, and not wanting to start with "scrub boarders" and begin the long tedious job of grading up with a good sire, my idea is to try green manures, lime, and commercial fertilizers.

Will green manuring, lime and fertilizers give the good results claimed for them in print? I am starting to build up a 1¾ acre piece in this way. It is a sandy loam, with little gravel. A small crop of weeds was plowed under last October and the piece wheel-harrowed and sowed to rye, now a good thick stand. This Spring, when it is about 18 inches high, it will be plowed under and the manure from two cows for six months wheel-harrowed in. I shall raise on one-half of this piece roots for hens and cows, sweet corn and vegetables, and an experimental one-quarter acre of potatoes—being careful not to put manure on potato plot. The other half I shall seed to buckwheat. Will the buckwheat be in bloom in time to plow under and seed the piece to clover, or would some legume make a catch after rye and manure as before mentioned? What I think, is that the quicker the land can be made to grow clover or other nitrogen gatherer, and the more they are plowed in, the sooner the land will be in shape to grow grasses and clover or Alfalfa, also other crops—with the addition of lime to sweeten the constant fermentation; and fertilizers high in phosphoric acid and potash. H. N.

GRAPE NOTES.

A 15-year-old Vine.

Would you advise me what I shall do with a grapevine that is about 15 years old, and has never borne fruit? It blossoms every year, but has no fruit.
Worcester, Mass. J. B. F.

Probably the reason that this vine has not fruited is that the flowers are self-sterile. This may come about through defective pollen—that is, pollen incapable of developing on the pistils of the flowers that produced it, or the flowers may all be male. In this case abundant pollen is produced but the pistils are abortive and do not function. This latter appears the more tenable explanation, for if other productive vines are near the sterile one they would quite likely fertilize it and fruit would be forthcoming if the difficulty be due to impotent pollen as was first suggested. As a relief for this condition I would suggest that the vine be cleft-grafted at or just below the surface of the ground to some desirable variety.
F. E. GLADWIN.

Making Grape Jelly.

I have about 16 acres set in Concord grapes five years. The average is about 4,000 to 5,000 one-half bushel baskets. Would it pay to put in a jelly outfit, and turn them into jelly? They ripen here about August 20, and we have had them to hang on about three weeks before we got through shipping. What would an outfit cost and how best put on the market? We made a few dozen last year on cook stove, put them on city market to grocerymen; quality pronounced first class. These few dozen paid well.
Worton, Md. B. F. R.

Grape jelly is evidently more in demand to-day than it has been for some years past. This is evidenced by the fact that some of the manufacturers of other grape products are about to begin the manufacture of grape jelly. There has been a great deal of jelly made and consumed in the New England States for some years. Most of this, however, has been made from the wild grapes that are picked green and which abound in the region. Whether some other variety or varieties than the Concord would be more adapted for this purpose is a question still unsettled. When Concords are used they are picked before they are fully ripe. A uniformally good and well advertised grape jelly should find a ready and profitable market. F. G.

How to Cut Vines.

I have two acres of Concord grapes two years old started for the Fuller system of pruning. They were trained to two vines. The past year laterals were pinched off at leaf as they started. Now I wish to bend down arms and cut back to four feet long and to one bud at spaces of about eight inches on each arm. I wish to know if I cut off lateral back to arm, will the dormant bud at crotch start with the other buds on arm that were not forced in growth this season? The reason for doing this is to have all bearing canes start from the same height on each arm. I also wish to know whether vine is injured in bending down if the outside bark cracks lengthways. These vines made a growth from 10 to 16 feet the past year, and it was hard to keep all laterals pinched out properly. R. C. H.
Leominster, Mass.

The basal buds of the laterals will start all right in this case but growth will not be as vigorous as that from the canes that are laid down as arms. This is due to the fact that the basal buds owing to their location are not so well supplied with plant food during the growing season as those toward the extremities where the sap flow is more abundant. The vines in question will be just as far advanced at the close of the growing season if the laterals be entirely removed and only the buds from the arms be allowed to grow. If there be sufficient and long enough laterals to reach from the arms on the lower wire to a second higher one fairly satisfactory yields may be obtained. Usually no injury results from the cracking of the outside bark; however, when bending down a cane for tying it sometimes happens that it is split nearly through, in which case, it very often dries out and breaks entirely away. When the canes are charged with sap as at the swelling of the buds they as a rule can be bent readily and without injury. F. E. GLADWIN.

Tobacco With Spray Mixtures.

Can any of the various tobacco extracts be mixed with Bordeaux and arsenate of lead mixture for spraying fruit trees at one operation, without affecting the value of either ingredient?
Lansdowne, Pa. J. H. B.

As I understand the matter, most, if not all of the tobacco extracts can safely be mixed with Bordeaux mixture; with lime-sulphur; with either of these containing lead arsenate; or with lead arsenate alone. In using tobacco extracts alone as a spray for aphids, it is best to add soap for a spreader. The soap usually contains free soda and is not needed and should not be added where used in combination with lead arsenate or either of the fungicides. W. E. B.

The Chemistry of Lime-Sulphur.

I note with interest your article on page 336 regarding the experimental mixing of spray materials, which brings to mind something which I noticed while spraying last Spring. For the blossom spray, an addition of a small amount of lime-sulphur was made to the arsenate of lead in order to combat scab and Codling moth with the same spray; this, I believe, I have seen recommended in THE R. N.-Y., as well as elsewhere. The resulting mixture was black, and a material resembling shoe-blacking gathered on the strainer. According to the chemistry I learned in high school, lime-sulphur is principally a solution of calcium sulphide, and this would react with lead arsenate if in solution. The formation of lead sulphide, which is black, would account for the blackness of the solution. When the spray was mixed as mentioned the lime-sulphur would be used up without affecting much of the arsenate of lead. Is this all correct, and if so, is the lead sulphide of any fungicidal value, or would it be better to use the arsenate alone? L. C. B.
Leominster, Mass.

The chemical composition of lime-sulphur is far more complicated, and the reaction does not occur in such a simple and direct manner as your formula would indicate. In fact, few expert chemists would be able to tell you exactly what would happen under the varying conditions. The commercial and homemade lime-sulphur mixtures contain a number of the higher sulphides of calcium, viz.: disulphide, trisulphide, tetrasulphide, and pentasulphide; the general name of polysulphides being given to all except the first. In addition to these another compound is formed called calcium thiosulphate, which on further boiling splits up into calcium sulphite and free sulphur. Calcium sulphide or monosulphide is probably not found in the mixture, as it is unstable and would quickly be changed. In the usual mixture, however, by far the greater portion consists of the tetrasulphide and the pentasulphide; and these are supposed to be of the greatest value for killing scale-insects. The chemistry of this mixture is explained in Bulletin 319 of the New York (Geneva) Experiment Station.

Whenever we add lead arsenate to a lime-sulphur mixture, there is always a change in color. Sometimes it blackens at once, sometimes it is first reddish or brownish, later becoming black. This blackening is undoubtedly due to the formation of lead sulphide but probably the reaction is slight and involves only a very small part of the mixture. A small amount of lead sulphide will color a barrel of mixture. The value of the whole as an insecticide or a fungicide is not materially changed. Ruth (Research Bulletin No. 12, Iowa Experiment Station) states that its fungicidal properties are not impaired by the addition of lead arsenate and the consequent blackening. W. E. B.

MRS. Brundage was crossing the ocean for the first time. One morning, as the captain was standing near her, she said: "Pardon my ignorance, but how do you manage to find your way across the trackless ocean?" "By means of the compass, madam," replied the gallant captain. "The needle invariably points north." "But," queried the woman, "suppose you wish to go south?"—Credit Lost.

The Home Acre.

BEAUTIFYING THE HOME GROUNDS.

The beautifying of the rural home grounds, particularly those of the farm, has been sadly neglected by the great majority of the owners of country homes. Why so many of our rural residents have been so tardy in recognizing the natural charm and beauty that can be imparted to their home surroundings, by the appropriate use of a few ornamental trees, shrubs, and vines and flowering plants, might be possibly explained in the lack of knowledge as to how to do the work properly, or that, in providing the necessities and comforts of life, they have been too busy to think of the pleasures that would accrue to themselves and their families, by the expenditure of a little time and a small outlay of money for that purpose.

The time has come when this important feature in country life must no longer be neglected by those residing in their own homes. Wealthy owners of large and small country estates, by the proper development of their property, and beautifying the home grounds, have set an example that should at least in a measure be emulated by all owners of rural homes, no matter how small and unpretentious the grounds may be. There are but few owners of country places who cannot do in a limited way at least, what their more fortunate neighbors have done on a larger scale.

The enhanced value of the property, the pleasures to be attained, the refining influences surrounding the home life, and the restfulness and beauty expressed in the trees, shrubs, flowers, etc., that adorn the home grounds, will many times repay the small cost of the improvement. Farmers will be doing a noble deed to agitate this subject in an energetic way, and not only point out the desirable and satisfying features of beautiful home surroundings, but to tell how easily and cheaply they can be attained.

Danville, Pa. MRS. E. O. S.

HOW TO KILL MOLES.

Will you give the best method of combating the blind ground mole which burrows along within an inch of the surface, raising up a ridge in its course? It is becoming quite a nuisance about here.

Butler Co., Pa. L. O.

The mole is a perennial nuisance to gardeners, and in addition to his own misdemeanors his runs seem to encourage the field mice to additional depredations. The mole subsists almost entirely on animal food—worms, insects, etc., and it seems generally agreed that his feeding damage is small, but the destruction to plants caused by the underground tunnels is very great. The mice, largely vegetable feeders, attack roots and bulbs and their work is certainly facilitated by mole runs. Owing to their insect diet, it is not easy to poison moles, and most gardeners are agreed that trapping is the best plan. There are several good mole-traps sold by seedsmen; set carefully in the fresh runs they are sure to catch the animals. The traps should be moved about and set in different runs. Another plan is to punch a hole here and there in the run, and pour into each place a teaspoonful of bisulphide of carbon, stopping up the hole immediately. Some gardeners report entire satisfaction with this method; others assert it does not work with them. A third alternative is the use of strychnine in solution. Small pieces of meat, or kernels of corn in the milk stage are soaked in the poison and dropped in the runs. We have also been told that little flakes of salt mackerel, soaked in the poison may be used, but cannot speak from experience. Trapping has always been our preferred method. Some terriers, and also cats, are excellent mole-catchers; one old cat we know will watch a mole-run for hours until she sees the mole working, then plunge in a paw, and hook the mole out, like a fisherman landing a fish.

HEDGES AND SHADE TREES.

My house is situated on a 50-foot lot within eight feet of the side line of a proposed street. I would like to plant a hedge along here, also shade trees at the proper distance. From rear end of house to street in front, runs a sewer line, not much over three feet in the ground. What can I plant that will give me the least trouble filling this sewer with roots? I see every year others having trouble this way. In front, have a privet hedge, but for this proposed one would prefer arbor-vitæ, as it would be on the northwest side and I could allow it to grow to a height of say six or eight feet. Looking off across this proposed street, over a strip of ground 150 feet wide, I see a row of houses with their backyards abutting up against my boundary line. Here too I would like to plant a hedge, preferably evergreen, so as to shut off unsightly views. What would you plant, and what size? I have to consider economy. What distances apart for a hedge that I would like to see grow to a height of 15 or 20 feet? Also, how far from the true line would you plant this hedge, considering that people in time and out of time start fires in these backyards, and they are not careful where fire goes to either. J. B.

Plainfield, N. J.

The American arbor-vitæ is extensively used for hedging purposes, and you would no doubt find it well suited for your northwest side line. Trees two to three feet high are a convenient and comparatively safe size to transplant, as well as being quite moderate in price, usually selling at about $30 per 100 retail. The trench should be dug at least two feet wide and 18 to 20 inches deep, and very old well-rotted manure mixed with the soil to the full depth of the trench. The quality of manure used should be at least equal to one-fourth the amount of soil. If manure of the required age and fineness cannot be procured, pure raw bone meal may be used at the rate of one pound to each lineal foot of trench. Set the plants 2½ to three feet apart. I might say there is no tree used for ornamental or other purposes whose roots will not sooner or later find their way inside the sewer pipes, filling them with fibrous roots. The soft wooded trees, on account of their more rapid growth and greater requirements of water, will send their roots to moisture much more quickly than the hard-wooded and slower growing trees, and therefore should never be planted in close proximity to a sewer line. The Norway maple is among the most beautiful of our ornamental shade trees, and being of rather slow growth will perhaps give as little trouble in the matter of clogging the sewer with roots as any tree you could plant. The Pin oak is another beautiful shade tree that is not liable to give much trouble in that way. You will find either of these trees very satisfactory, as a shade tree, with the danger of clogging the sewer with roots, reduced to a minimum. The Norway maple is priced at about $1.25 each for trees eight to 10 feet; the Pin oak at $2 each for trees of the same size. Any first-class nursery can supply trees of these sizes named. Plant either of these trees 25 feet apart.

For the boundary line at rear of the row of houses, there is no other plant quite so well suited for hedging and screening out such undesirable views as the California privet. Plant a double row of them, two feet apart and two feet apart in the row, breaking joints and in a few years you will have a hedge screen that will be practically impassable and impenetrable to the eye, as well as being almost indestructible. Do not prune or shear off the tops, but allow it to grow at will. You can plant it to within two feet of your boundary line, and if at any time the limbs should hang over the line and be objected to by the adjoining property owners, it will be a comparatively small job to cut off the offending branches to the dividing property line. It will not be safe to plant evergreens on or near this line in hedge-row, as they sooner or later would be almost certain to be destroyed by fire. Plants four to six feet high can be bought at $8 to $10 per 100. K.

A TEACHER trying to impress on her children the rightness of kindness toward all animals, took them for a walk, to bring the lesson home to them. Hearing a scream from little Johnny, she asked: "What's the matter, Johnny?" "I've been sitting on a hornet," was the tearful response, "and I'm afraid I've hurt the poor thing."—Delineator.

AN Easterner who had bought a farm in California had heard of his neighbor's talent for raising large potatoes, so sent his farm-hand over to get a hundred pounds. "You go back home," answered the talented farmer to the messenger, "and tell your boss that I won't cut a potato for anyone!"—Everybody's Magazine.

Lay Your Building Problem on This Table

Famous Board of Seven
Master Designers, Builders and Manufacturers

"I'll Pay $1.00 for Every Knot"
—that's my 1914 challenge to every man who buys or sells lumber! I'll pay $1.00 per knot for every knot any customer can find in our Red Cedar Siding shipped from Bay City. I stand ready to prove to you in this way that the lumber in Aladdin Houses is higher in grade throughout than is regularly carried by any seller of lumber in America. *Clear Siding, Clear Flooring, Clear Interior Finish and Clear Shingles are furnished for every Aladdin Dwelling House.*
O. E. SOVEREIGN, *Gen. Manager.*

Before this Board of Seven comes every Aladdin House for the acid test of perfection. No detail escapes the keen, searching analysis of these experts. The designer must prove his plans to the complete satisfaction of: First, the Master Designer, for accuracy; Second, the Master Builders, for practicability, strength and structural harmony; Third, Factory Experts, for elimination of waste, standardization of lengths and economy of costs. Unless the work of these high priced men could be spread over a thousand houses, the cost would be prohibitive. No other organization can subject each house design to this searching and costly inspection.

ALADDIN Readi-Cut Houses, Barns, $137 to $2,000

Aladdin Readi-Cut houses save you four profits—no middlemen, you buy direct from the maker. Aladdin houses have better lumber. "One Dollar for every knot found in our Bay City Red Cedar Siding" is the Aladdin guarantee that protects you. No other dealer gives you this protection. All material cut to fit—saving you one-third on the cost of labor—you can build your house in half the time. Aladdin catalogs show pictures of houses and farm buildings from $137 to $2000. Get the big Aladdin catalog today—free on request.

Warm Air Furnace $28.95
Complete Bathroom Outfit $37.50

5-Room House Complete $298
This Snug, warm winter home with five rooms, $298. Price includes everything needed to build. All lumber cut to fit, hardware, locks, nails, paints for two coats. Can be shipped same day order is received. Complete $298.

Aladdin Price Includes Everything
Price for every Aladdin house includes everything necessary to build. All lumber cut to fit; framing lumber, sheathing, siding, shingles, interior finish, windows, lath and plaster or plaster board, hardware, locks, nails, paints and oils for two coats, inside and outside—in short, a complete house. Send today for Catalog No. 340.

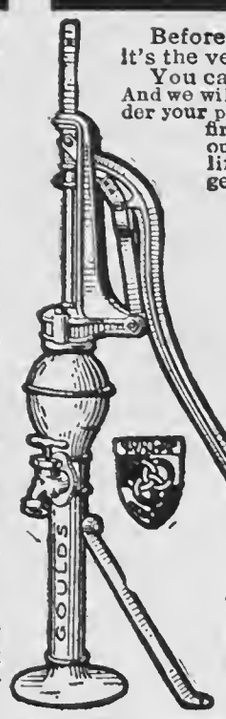
Goulds No. 423 A Great Farm Pump for General Use

Avoid Pump-Buying Mistakes

This is one of our latest types—adjustable stroke, force pump standard.
The adjustable stroke adapts the standard for connection to any windmill or pump-jack.
Revolving bearer top permits the lever to be set and operated at any angle with the spout.
Large air chamber gives steady, even flow at spout.
Nut and hose tube spout for connection with garden hose.
Outlet back of spout tapped for iron pipe connection.
Extra strong construction throughout. Ask your dealer for Goulds No. 423.



Before you buy a pump or water system of any kind, be sure it's the very one best adapted to your needs.
You can choose from over 300 types of Goulds Reliable Pumps. And we will tell you which type will give the best results when used under your particular service conditions. By getting exact information first, you'll save yourself worlds of trouble and expense. Write our Mr. Gould, in charge of our Consultation Department. His lifelong knowledge and experience are at your service. You can get his help without charge on any water supply problem.

GOULDS RELIABLE PUMPS

Outsell All Other Pumps
For 65 years Goulds Pumps have been preferred by pump buyers who wanted longest and most satisfactory service. As a result, today we make more pumps than any other concern.
And due to our enormous output, you pay no more for Goulds quality than for pumps of less merit. The best dealers in every locality handle Goulds Reliable Pumps. Look up the one in your section.

How to Have Running Water
This luxury is possible on your farm. Send for our free book, "Water Supply for Country Homes." It describes and pictures the most practical systems—hand, windmill, power, and hydraulic ram, with the most desirable type of pump necessary. Write for the book today. (30)

Largest Manufacturers of Pumps for Every Purpose

THE USE OF COMMERCIAL BACTERIA.

There is a company which advertises a preparation which is intended to inoculate soil for leguminous plants, such as Alfalfa, clover, etc. They charge $2 per can. A can of this, they say, is sufficient for one acre. Can you tell me if there is such a commercial product in the line of a bacterium which will actually collect nitrogen from the air? If there is such a product would you advise one to invest in it? O. A. H.

New York.

The bacteria which are offered for sale are not intended to inoculate the *soil*, but are intended for use upon the seed. Inoculation of the soil would be understood as taking several hundred pounds of the soil from a field in which Alfalfa or clover had been successfully grown, and scattering it over the ground at the time of seeding. The object of this would be to introduce these bacteria so that they would spread and grow throughout the soil. The commercial bacteria are usually intended for use upon the seed, so that when it is put into the ground the bacteria will develop and do their work. The scientific men have proved that the pod-bearing plants, running all the way from Alfalfa to locust, are able to secure nitrogen from the air. For a long time it was evident that these plants possessed the ability to do this, but the scientific men could not explain how it was done. They finally discovered that the nitrogen was obtained through bacteria, or tiny forms of life, which live in little nodules or warts upon the roots of these plants. This knowledge led to various ways of introducing these bacteria. It was of the utmost importance to have these bacteria present. The simplest way of introducing them is to dig 300 or 400 pounds of soil out of a field where they are known to be present, and scatter this soil over an acre of ground at seeding time. It is not always possible for farmers to obtain this soil. It is also found that this soil will not only carry the bacteria, but also an abundance of weed seeds as well as germs of various diseases of plants. The chemists therefore worked out a plan for adding this bacteria without using the soil.

In a way this plan is similar to the modern system of distributing yeast cakes for bread raising in the place of the old plan of making the homemade yeast and distributing it through the neighborhood. The bacteria are taken from the soil and propagated or bred in a laboratory. They spread rapidly, and are so small that many millions of them can be put into a small bottle. These bacteria propagated in this way are bottled and sold with the food which they need for growth and propagation. Thus a farmer can buy a bottle of these bacteria and handle them according to the directions so as to increase them with great rapidity. The liquid in which they are bred may be sprinkled over the seed. Thus when the seed is put into the ground these living bacteria are attached to it and if all goes well with them, do their work upon the roots of the plant and spread through the field. This is the theory upon which these commercial bacteria do their work. It is a sensible method of inoculating the seed and starting it properly. It often happens that these commercial bacteria are not properly handled so that they lose more or less of their force and thus do not give complete satisfaction; but when handled properly, and if the ground is in proper condition with an abundance of lime, the introduction of these bacteria will certainly help the seed. The great trouble has been that farmers have not understood the most important thing about these bacteria. They cannot possibly take the place of fertilizer, of clean cultivation, good seed and lime. Somehow farmers get the idea that these bacteria will make Alfalfa or clover grow on very poor soil, but really they will do nothing of the sort. They are only an aid in the starting of the clover or Alfalfa seed into proper growth. They have their limitations, and unless the soil is in proper condition, the money spent for bacteria might far better be given to some charitable object.

"WHO was that modest-looking young man, Cyrus?" "Modest looking? Say, what do you think he was?" "I don't know. "He was a moving-picture maker. All he wanted was to borrow our church for a mock marriage, and then have a bogus shooting affray on the front steps!"—Cleveland Plain Dealer.

THE MAIL BAG.

Hand Power for Spraying.

Can as good results be obtained with a hand as power pump and which is advisable for spraying about 300 trees, 15 years old? L. J. B.

No, not in the majority of cases. It is a matter of steady pressure back of the nozzle. The power sprayer will keep up a constant high pressure which drives out the spray uniformly. The hand pumping is apt to be intermittent or irregular, for it takes a superior man to work the pump at constant high pressure.

A Silo Question.

Would it be good business judgment to construct a silo where eight cows are to be kept to produce milk for Bordens? If so what size and character of construction, concrete or wood? L. B.

Yes, if you consult the Borden people beforehand and learn what kind of a silo they will endorse. We understand they permit the use of silage under certain conditions which insure its being wholesome, but they will prohibit the use of inferior silage. Get their views before building.

Acetylene Refuse.

One of our neighbors spoke to me about getting a barrel of the refuse taken from acetylene generator to use around peach trees; claims it will kill grubs. How about apple and other trees? Is there any danger from emptying on grass or garden? A. S. B.

Rock Stream, N. Y.

This refuse is lime—about as valuable as ground limestone. After a month's exposure to the air there would be no danger from its use. We doubt if it will have any value for killing peach borers. We should simply spread it over soil which needed lime.

"Mill Run."

What does "ground screenings not exceeding mill run" mean when printed on the tag of a bag of feed? E. J. W.

It means that under the present law dealers are obliged to state what their feed contains. Formerly it was possible to buy pure bran or shorts, but now many millers blow the screenings taken out of the wheat back into the bran and sell it all together. "Mill run" is supposed to mean the average proportion of "screenings" found in the grain, but analysis often shows that there is much more than this put into the bran. "Screenings" are supposed to be the shrunken kernels of grain which are unfit for flour making. They also contain weed seeds and often oat hulls, sweepings and trash. In one case a feed was found to contain nearly three per cent. of sand and dirt, which all came from the screenings.

Poultry Droppings for Potatoes.

I have always used hen manure for corn with good success, also used it in the garden and around apple trees. I have always grown my potatoes with high-grade phosphate, and they have been smooth, free from scab and rot. Will it do to use hen manure either plowed or harrowed in for potatoes, or is it liable to produce scab? Most of my neighbors use stable manure in their potato field and usually have scabby potatoes.

F. A. C.

Hen manure contains a good proportion of ammonia, which is an alkaline, and might under some conditions increase the amount of scab if the potato seed contains much of the disease, or if the soil is filled with the germs. Under ordinary conditions there would not be much danger, and we should go ahead and use the manure. Some fine results have been reported to us from the use of crushed hen manure put on top of the hill and worked in.

Getting Rid of Pigeons.

Can you suggest a plan whereby I can get rid of the pigeons, which are a perfect pest, around my house? Being a closely settled neighborhood, and in the city limits, it is impossible to shoot them. They originated from a pair that a neighbor had, but now are claimed by no one, and a nuisance in the neighborhood.

Huntington, W. Va. J. S.

We were troubled in the same way, and got rid of the pigeons by shooting a few of them and keeping the barn closed as much as possible. The noise of the shooting seemed to frighten the pigeons and keep them away. If conditions are such that a gun cannot be used, you might poison them. Soak wheat in a solution of strychnine and sugar, and put it on a platform high up in the air, out of the reach of the farm poultry. Keep the barn closed as far as possible, and put this poison, if you can, where the pigeons are most likely to enter the buildings, or where they congregate. This will kill a number of them, and the rest will become suspicious and leave. The poisoned pigeons should be buried as soon as possible after they fall. We regret to poison these birds, but we know what a nuisance a flock of them will soon become if they are not driven off or taken care of.

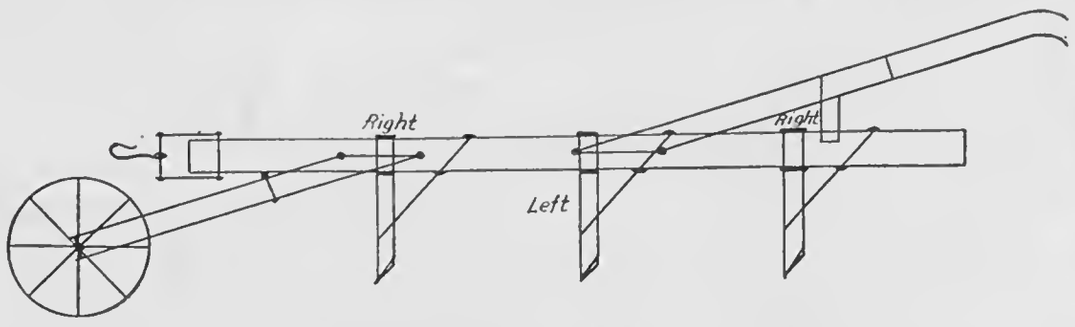
FROM OUR FARMS TO YOURS

Farm Management.

Spring Work.

The time for Spring work will soon be on hand. One of the most important things is draining land. With our short seasons and scarcity of help, this is often postponed for another year, and so on. As one of the great family of THE R. N.-Y. readers, I thought it would interest some to learn how we overcome the hardest work in draining, by a homemade tool, with which we can beat any ditching machine, horse or steam power, on stony and heavy land, such as we have here in Central New York. I send a rough sketch, and this is the way it is made: One hardwood plank, oak or maple, eight



HOMEMADE DITCHING TOOL.

or 10 feet long, three or four inches thick, 12 or 14 inches wide; three teeth of round iron or steel 1¼ inch thick, 16 or 18 inches long, with braces, welded to it, as shown in sketch. There is a shoulder on standard and braces for the plank to rest on, threaded on top. The lower end of teeth are flattened out and shaped like a cultivator tooth. The front tooth is set to the right, the middle to the left, and the last one to the right. Irons are about eight inches apart, and will make a ditch 10 to 12 inches wide. A pair of old cultivator handles will do to hold it. The depth is regulated by a wheel, as seen. I hope that some one may profit by this tool, which can be made for about $10 or so. J. B.

Central New York.

Sensible Talk About Vermont Farms.

I see by THE R. N.-Y. on page 395, that E. D. A. of New Jersey thinks, because land is cheap in Vermont, he can buy a farm here and make his fortune. The probability is that if the farm is in the southern part of the State the land may grow apples; if it is in the central or northern part it probably will not at an altitude of 1,000 feet. It is generally thought that a northern slope is better than a southern, as in the latter case the blossoms are more apt to be nipped by a late frost.

Your advice is good. By all means see the farm in the Spring—and in the Summer—and in the Fall; then make up your mind. It is as reasonable for a farmer to go down to New York City and purchase a dry goods store and engage in that business, as for one green at farming to engage in that business and expect to succeed. Fruit raising is good business and some succeed in it, but most do not. If E. D. A. wants to raise fruit, let him begin working for someone who understands the business and has made a success of it. There are a few such in Grand Isle, Chittenden and Addison Counties—possibly elsewhere—but I am not acquainted in the east part of the State. Planting trees, cultivating, trimming, spraying, digging borers, thinning apples and properly picking, grading and packing the fruit are different parts of the business which must be thoroughly learned if one expects to succeed. After E. D. A. has worked at the business a year or two, he will know whether he is adapted to the business, what varieties do well in any locality. The probability is that E. D. A. will not purchase a farm on the mountain for fruit growing. The Fameuse and crab apples are the only kinds that I think are really adapted to the mountains.

Look out for windy locations on the mountains. They can be known by the branches on the trees and by the bark. In Addison and Chittenden counties the western slopes of the mountains are swept by northwesters—either is fatal to fruit raising, since much of the fruit would be blown off in the Fall. In a region where southeast winds prevail, the branches of the trees in open positions are much shorter on the southeast side and the bark is smoother than on the opposite side. This condition of bark is more noticeable in deciduous trees than in evergreens, while the difference in the branches is rather more marked in evergreens.

If E. D. A. is willing to wait for returns and if the 240-acre farm is situated so he could ship pulp timber to advantage, he might purchase the farm, and set the 150 acres to Norway spruce. This species should not be set for lumber. After 15 or 20 years he can thin the trees and get an income, and after 10 or 15 years more he can get quite a cut of pulp. Most of our mountain land is better adapted to forest growing than to farming.

It seems strange that Vermonters should purchase land in New Jersey expecting to go there and make their fortune raising peaches, and that people in New Jersey should purchase farms in Vermont with the same ultimate object. I suppose such is the method of land agents. A. V.

Concrete Porch.

I wish to build a concrete porch 20x9 feet. The ground where I build is raised about four feet above surrounding soil. How deep do I need to go for foundation? L. C. M.

The foundation supports of a concrete porch should be carried below the frost line to avoid trouble from heaving. The necessary depth varies, of course, with the nature of the soil; from your diagram, I should judge that the cobblestone filling would prevent any heaving from frost, and that you would need to go only deep enough to secure firm footing for the concrete wall. M. B. D.

"Now the first thing to learn about the shoe trade is this: As soon as a customer comes in, take off his shoes and hide 'em." "What's that for?" "Then you can wait on 'em at your convenience, my boy. They can't walk out."—Winnipeg Telegram.

SAPLEIGH: "How much money do you think a man ought to accumulate before he can safely ask a girl to marry him?" Miss Keen: "It depends on the man, Mr. Sapleigh. You will probably have to accumulate several millions."—Boston Transcript.

They Say He's Worth 8 Million Dollars

Yes Sir! American farmers and business men, and their wives and children, have said, "He's worth eight million dollars," for they've paid that much to 20,000 jewelers to get him to come to work in more than three and a quarter million homes (3,250,000).

Big Ben is only four years old, but he's made a bigger success for himself than any other clock alive.

You'll find him on all of the big farms—helping to get the farm hands out on time—helping to get the bigger, better yields. You'll see him 'round the house telling the womenfolks the time all day so they can have the meals on time.

You'll see him in the parlor on the mantelpiece—7 inches tall, sturdy, handsome, triple nickel-plated, ticking quietly and *'tending to his knitting*.

In the bed rooms in the morning you'll hear him calling different people different ways—in "that" room, with one straight "hurry-up" five-minute ring, and in "that other room," with ten short "reminder" calls lasting ten minutes. Tell him how you like your call—he'll accommodate you.

Call on Big Ben at your jeweler's. His price is $2.50. Let him show you what he does. If your jeweler hasn't Big Ben, a money order for $2.50 addressed to his makers—*Westclox, La Salle, Illinois*—will bring him to you anywhere in the States prepaid by parcel post.

(205)

"Can't-Sag" Gates Save You BIG MONEY

Alvin V. Rowe, Pres.

Cost only one-third as much as ordinary iron, wire or gas pipe gates, but last twice as long. Neat in appearance—best and strongest gate made—light, easy to handle, opens both ways. Boards are double *bolted* between eight angle steel uprights and double truss braces. *guaranteed never to sag.*

Cost Less Than All Wood Gates—Last 5 Times as Long

Can't Sag Gates are furnished complete, ready to hang, or just the Gate Steels which include everything except the boards. Patent self-locking hinge feature---reinforced two piece malleable hinges. Six Triangular Truss Braces make gates extra strong.

Improved Elevating Attachment permits the gate to be raised full length from 5 to 30 inches, so small stock can pass under, and to swing over snow.

30 Days Free Trial and 5 Year Guarantee

Catalog shows both complete Gates and just the Steels, at prices you can't afford to miss. Send for my new catalog with free 30 days' trial and *freight prepaid offer*.

Protecting Early Cantaloupes.

By placing a five-inch square frame (¾-inch stuff) four inches high, covered with tobacco cloth over a hill of cantaloupes, at the usual time of planting, will it make them any earlier? It will almost insure a perfect stand, and will keep away all insects until the plants get four or five rough leaves. I remember when I farmed in Southside, Virginia, we always made a tent of two birch twigs covered with tobacco cloth. We did it not to get the melons any earlier, but to protect them from the striped beetle. We never grew them for market, just for home use, but I remember well how much faster those grew that were protected by canvas. I am now in a great commercial cantaloupe country and would like to get my fruit in with the earliest. If I can get them well started I do not see why I should not be in with the first. They usually commence selling around $2.50 for carrier holding 45; in a week they get to $1.50, in two weeks to $1, and the remainder of the season from 45 to 60 cents. So you can readily see the importance of getting some in very early. I am only a small grower—about three acres. I composted my manure with ditch scrapings, one load manure and one load scrapings alternately on the pile, which was done in early Winter. I turned the pile three times and late in January. I put it in the checks 3x4, one big forkful to each crossing. When I plant what grade of fertilizer must I use and how much to the hill, and will it be necessary to make another application? It will cost around $15 per acre to cover the hills. If it is a success the little frames will last several years, the canvas will have to be replaced annually, but it is quite cheap, costing by the piece, two and one-third cents a yard. Will you give me your advice about this matter? I. S. W.

Maryland.

I have no doubt that, other things being equal, your plan of covering each cantaloupe hill will bring them earlier. Often a strong wind will do as much damage to young cantaloupe plants as a frost, and if you can keep those coverings in place they will serve to protect the plants from wind as well as from cold. However, I would try them on a small scale first and then, if satisfactory, enlarge next year. Sometimes two wires are bent like croquet arches and placed in the ground over the hill so as to form a sort of a skeleton tent, which is covered with cloth. This is quite similar to your bent twig idea or plan used in Virginia. While these plans may be all right I do not think they are used to any great extent in a commercial way. The growers in this section who want to come on the market with the first cantaloupes, usually start the plants in cold frames under glass and then have them ready for the field about the time the field planted cantaloupes are appearing above the ground. In order to get them transplanted without disturbing the roots it is necessary to plant the seeds on old sods, in berry baskets, or better yet in checks four inches apart each way, in a bed made up of three inches of fine manure overlaid with two inches of strong loamy soil. When plants get out in rough leaf the soil and manure is cut clear through with a tomato blocker (blocker is a hilling hoe with a straightened shank) which leaves each plant, or more usually two plants, standing in a four-inch block of soil and manure all to itself. If handled carefully these blocks can be taken to the field in a cart without disturbing the roots. Plants grown in this way have the advantage over plants started in the open field. But there are many chances of failures in such work and it should be tried out in a small way before going into it on a large scale.

Growers in this section seldom use both fertilizer and manure. The plan is to turn down a clover sod and use fertilizer in the hill, being careful to have the fertilizer well covered with soil, so that the seed will not come in direct contact with it when planting. A high-grade truck or vegetable fertilizer is used analyzing about 4-8-10. A large handful is placed in each cross or hill. In the absence of clover sod we use a large shovelful of strong hog-manure under each hill, without fertilizer. We have found no fertilizer or manure that will keep up a healthy vine growth until late in the season as well as a rich manure from the hog-pen. A second application of fertilizer will often aid in maintaining a heavy vine growth and in increasing the yield. The second application of fertilizer should be applied about the time, or a little before, plants begin to vine out and it should be harrowed in immediately. It should be applied at least six inches from the plant and care should be used to keep all particles of fertilizer away from the stem of the plant. TRUCKER, JR.

Sowing Asparagus Seed in Bed.

I would like to say that I differ with C. W. P. (page 436) in regard to the sowing of asparagus seed where the plants are to remain. In the first place there is no need for the roots being eight inches in the ground, unless you want to cut the hard white-butted shoots, for the markets are now very generally demanding tender green asparagus. But if this is the case and you want the roots deep in the ground there is no difficulty in getting them there from seed. I make trenches about 15 inches deep and fill them half full of fine rotten manure, cover lightly with soil and sow the seed, and when the plants are a few inches high thin them, and then work the soil to them as they grow till level. Then I give them several dressings of nitrate of soda during the Summer to push a strong growth, and I have cut fairly good shoots in 12 months after sowing the seed, and the second year cut fine shoots when transplanted roots would be making them like knitting needles. Four years ago I left a row in my garden for transplanting, and the remainder left as usual, and to this day the transplanted plants have not caught up in size of shoots to the ones that were never removed. That there is any more difficulty in combating insects and weeds than with the transplanted roots, I have never discovered. I can get asparagus at least a year sooner by untransplanted roots than by transplanting, and I want my roots rather near the surface, where they start earlier and give me tender green shoots.

W. F. MASSEY.

"Papa?" "Well?" "I read in today's paper that the elks in the State of Washington multiply very rapidly." "What of it?" "I wish you would find out if they are any good on fractions, and if they are, get me one to help with my home problems."—Houston Post.

The Home Acre.

Anthracnose in Raspberries; Kainit.

1. We have about 40 raspberry bushes, 12 of which are St. Regis. Last Summer on the old bushes the leaves turned brown and withered away. The berry, blossoms and the stalk on many of the bushes did the same thing. On the St. Regis the leaves act the same way; the stalks get a purplish appearance with greyish spots. I think it is anthracnose but am not sure. Is it advisable to spray with Bordeaux mixture before the buds swell and also after the blossoms fall? 2. Is it advisable to dig 100 pounds of kainit into about 1,200 square feet a week before planting, say corn, tomatoes, beans, etc.? Would raspberries be benefited by a handful around each bush? T. A. B.
College Point, N. Y.

1. Your raspberry plants were without doubt attacked by anthracnose and to prevent a recurrence of the attack this season all diseased canes must be cut out and burned, and those remaining must be thoroughly sprayed with 5-5-50 formula Bordeaux mixture as follows: First spraying before leaf buds open, spray young canes soon after they appear above ground; repeat the application 10 days or two weeks later, and again just before the blossoms open. The meaning of 5-5-50 mixture is five pounds of copper sulphate, five pounds of unslaked lime and 50 gallons of water.

2. Raspberries would not benefit to any appreciable extent by the application of a handful of kainit around each bush. To produce large luscious berries such as bring the top notch price in the market, requires liberal manuring and fertilizing. The ground should have a liberal application of well-rotted manure annually, along the rows, in Spring, supplemented by an application of muriate of potash at the rate of 200 pounds, and ground raw bone at the rate of 600 pounds per acre, plowed in as soon as the ground is in good workable condition. Cultivation should continue up to the time the fruit commences to ripen. To neglect the matter of liberal fertilizing and adequate cultivation of raspberries is to invite a crop of small-sized undesirable fruit that must be sold at greatly reduced prices. The application of 100 pounds of kainit to 1,200 square feet of ground would be of more or less benefit to such crops as corn, tomatoes, beans, etc. The extent of the beneficial results will depend much on the texture of the soil, and the amount of lime it contains. A liberal application of well-rotted manure will prove much more beneficial than the kainit.

K.

Poultry in Sprayed Orchard; Grafting Wild Apples.

1. I am intending to set out strawberries, raspberries, currants, etc., this Spring and also raise a considerable number of chickens. Do you think the spraying is required on such fruit during the first season, and if so would there be any danger to chickens allowed free range among the fruit, and also among potatoes that have been sprayed? 2. There are a number of small apple trees about two or three years old that have been growing up wild and clumped up in a corner of the farm. Would it be profitable to transplant the best of these trees, cut off tops and graft on scions? If so could this be done all at once in the Spring, or would it be better to transplant this Spring and do grafting later on? B. F.
New York.

1. Strawberries and raspberries will not need to be sprayed the first year. Currant bushes should be sprayed with lime and sulphur solution as soon as set out to guard against the San José scale, and later, when the leaves are one-half to two-thirds grown, to kill or prevent the currant worm from defoliating the bushes. No danger to the chickens. Potatoes must be sprayed for the potato beetles, also for potato blight. 2. I have used "wild" apple trees from fence corners, and have grafted them, also later in the season when the grafts did not take, put in buds, with good success. The trees must be strong, well-rooted, straight, and clean from the bottom up, no forks or sprouts from the bottom. But they are very apt to send up suckers from the roots, and if not well cared for and watched every year the suckers will sap the life from the tree. They can be grafted as soon as transplanted, leaving some limbs on to draw the sap up to the scions. J. A. H.

Small Fruits in Shade; Yearling Fowls.

1. I have a city lot 40x154; two apple trees and one pear tree on the back. Could I raise blackcaps or red raspberries, strawberries or any small fruits under the trees? 2. What is meant by yearling hens, from the shell one year, or from the first egg one year?
Rochester, N. Y. G. W. R.

1. Small fruits of every kind will produce more or less berries in shaded situations. In the wild state, small fruits are found in almost every situation except in the densely shaded woodland, particularly the raspberry, blackberry and gooseberry, but the plants that are subjected to much shade rarely produce as heavy a crop, nor are the berries as large and of as good quality as those that have the benefit of full sunlight. Full exposure to sunlight is always desirable for strawberries, raspberries and blackberries, but currants and gooseberries are benefited by partial shading. If the trees are not large enough to prevent sunlight from reaching the plants, raspberries and strawberries may be grown near them with more or less success, but do not plant too close to the trees. On account of the limited root system of the bush fruits they will be greatly handicapped when grown near trees unless they are liberally supplied with manure or fertilizers, which must be supplied annually as a top-dressing and worked into the soil. In general practice the planting of berries in shaded situations is not commendable, but when one is limited to a small area upon which to plant these desirable adjuncts to the garden, it is perhaps better to attempt to grow them in such situations for home use, than to pass them by entirely.

2. All male and female chickens less than one year old from day of hatching are designated as cockerels and pullets. At the age of one year and upwards, as cocks and hens. K.

SUCCESS WITH HENS, by Robert Joos. The suggestions given in this book are definite and practical. There are 55 chapters, covering the subject from incubation to marketing of the product. Feeding, housing and care of poultry disease are all given attention. Published by Forbes & Co., Chicago; price $1.00.

LUCILLE (earnestly): "Karl, I want to ask you one question." Karl (also earnestly): "What is it, sweetheart?" Lucille (more in earnest than ever): "Karl, if you had never met me, would you have loved me just the same?"—Life.

You Pay Too Much For Tires

When You Pay More Than Goodyear Prices

Prices on Goodyear No-Rim-Cut tires have dropped 28 per cent in the past year alone.

Some other tire makers have not met these reductions. But let us see if those high prices mean better tires.

In No-Rim-Cut tires you get these four features found in no other tire in the world:

The 126 braided wires in the tire base—the only way known to make a satisfactory tire that can't rim-cut.

The "On-Air Cure." That is, each tire is final-cured on an air bag shaped like an inner tube. That is done to save the countless blow-outs due to wrinkled fabric. And it adds to our tire cost $1,500 per day.

The Rivet Fabric breaker strip, for the rights to which we paid $50,000. It lessens, by 60 per cent, the danger of loose treads.

The All-Weather Tread. A double-thick tread of very tough rubber. As smooth as a plain tread on dry roads, but a sharp anti-skid on wet.

Note that no other tire, whatever the price, offers one of these costly and tire-saving features.

GOODYEAR AKRON, OHIO

No-Rim-Cut Tires

With All-Weather Treads or Plain

More Mileage

Will higher-cost tires give more mileage? We have had scores of experts working for years to build a tire that gives more mileage. They are in our department of research and experiment. They have made thousands of tests. And they say that No-Rim-Cut tires as made today mark the limit in tire mileage.

And note this: In late years, when most cars carried odometers for measuring tire mileage, No-Rim-Cut tires have outsold any other. In 1913 we sold eleven times as many as in 1909. And all because of mileage records on perhaps 400,000 cars.

The Real Reason

It is easy to build tires to cost less than Goodyears. It is simply impossible to build a tire worth more.

The reason for our prices lies in mammoth output—the largest in the world. It lies in efficiency which results from years of tire-making. It lies in small profits. Our profit last year averaged 6½ per cent.

Let these tires show you what they save in trouble, save in upkeep to hundreds of thousands of users.

Goodyear dealers are everywhere.

WHAT KATY DID.

Will you tell me what the enclosed insects are? J. J. M.
LaFayette, Ind.

The interesting eggs on the branch mentioned in the foregoing letter were those of one of the katydids. The katydids are members of the grasshopper family, and are most interesting insects from many points of view. All of the katydids are noisy insects, especially during the night. The true katydid begins its shrill rasping song as soon as the sun disappears behind the western horizon, and keeps it up until day breaks in the east. The singing is at its height in August, and the song has been translated as "Katy did, Katy did; she did, she didn't." In this case it is the husband of Katy that makes most of the noise, for it is the males that do the singing. Whatever Katy is alternately accused and acquitted of doing we shall never know. Katy, herself, feebly but regularly answers her husband's querulous song with a single, spirited "chirp" which probably constitutes a scoff and a denial of the allegations.

The katydid that laid the eggs on the branch in Fig. 238 is known as the larger angular-winged katydid (Microcentrum laurifolium). The eggs are laid in the Fall, after which the insect succumbs to the vicissitudes of her strenuous life and

KATY. ID'S EGGS ON BRANCH. Fig. 238.

dies. Each egg is slate-colored, oval in shape and rather large, being shown about natural size in the figure. The insect first roughens the branch by biting off the bark with her jaws, and then deposits the eggs in two rows, glueing each egg fast. Each egg overlaps the one just above by about one-quarter of its length, and the eggs of the second row are deposited alternately with those of the first row. These eggs rest on the branch all Winter, subject to the variations of the weather conditions, and withstanding them successfully. About May they hatch, and the young katydids live for the most part upon bits of the leaves that they bite off and chew. In about two months they become full-grown and then their songs begin. The singing, however, of this angular-winged katydid is different from that of the true katydid, for it is simply a repetition from eight to 20 times of a sound like the syllable "tic." Apparently these katydids do not become abundant enough to cause any serious injury. At least the writer has never known them to injure trees to any extent. Probably they could be killed by spraying the trees upon which they occur with arsenate of lead.

GLENN W. HERRICK.

"You are the only member of the class that is not prepared on the subject of Moths," said the nature teacher, sternly. "Did you get a book at the library as I told you to do?" "Yes, Miss Burton," replied the boy, "I found a book about moths but I couldn't make much out of it." "What was the name of the book?" "Hints for Young Moth-ers."—Winnipeg Telegram.

VETCH AS A MANURIAL PLANT.

PART II.

INOCULATION FOR VETCH.—Although Hairy vetch can be grown on practically any well-drained type of soil in New York State, its success depends largely upon the presence of nitrifying bacteria in sufficient quantities on the roots. If Hairy vetch is to be grown for the first time on the farm, it is a matter of prime importance with the farmer to inoculate the soil with the proper germs to promote the growth of bacteria on the roots of the plants, and thus obtain the full nitrogenous value of the crop. There are two principal methods of securing this inoculation. The most successful one, and the one generally used in the East, is to use soil from a field that has already been producing a thrifty crop of vetch for the last few years. If this method is to be followed, it is advisable to get the soil from as near at hand as possible for then the bacteria are acclimate to the local conditions. A loam or clayey soil is usually considered best for this purpose because it contains more organic matter and a corresponding greater amount of bacteria. Possibly the easiest way of applying this transported soil is to scatter it over the field at the rate of 250-350 pounds per acre, judgment being used as to the strength of the culture. When scattering in this way it should be harrowed in immediately, for if long exposed the strong sunlight will kill the germs. Another method sometimes employed is to screen the soil, mix it with basic slag and vetch seed and then distribute it by means of a combination drill at the time of sowing. It should be noted however, that the acid form of phosphate will kill the bacteria when it comes in contact with them, and so if this form of phosphate is to be used it should be applied fully a week or even longer before inoculation. The United States Department of Agriculture at Washington has for distribution an artificial vetch culture. The chief advantage of using this lies in the fact that fewer weed seeds are present than in the so-called natural cultures. In nearly every case, however, the results have not been as satisfactory as in the use of the inoculated soil.

A PRACTICAL METHOD.—One plan that every farmer could use to advantage might be something like this: Take a small plot of ground of approximately half an acre, fertilize it in accordance with the system in use upon the farm, harrow in about 150 pounds of inoculated soil, and then sow it with 40-50 pounds of Hairy vetch seed and about a bushel of oats. Oats are perhaps the best crop to sow with the vetch, as maturing at a different time, the crops can be kept distinctive. In the first year there may be only partial inoculation, which is indicated by the healthy green plants intermingled with the poorer yellow ones that have not yet received enough bacteria on the roots to form nitrogen nodules. The second season, however, in nearly every instance will show a complete inoculation, and an abundance of inoculated soil will be available to distribute over the fields where vetch is to be grown. It is a curious fact, too, that when a couple of quarts of vetch seed is sown with Winter oats for a number of years, the soil gradually becomes inoculated. This is due to the fact that all vetch seed has clinging to it more or less of the nitrifying bacteria. This method is seldom used as it takes too long to get the best of results.

Thus in the growing of vetch, one of the first points a farmer must consider is the proper inoculation of the soil. A small plot in which to prepare his own cultures, will not only give him a cheap source of nodule-forming bacteria, but will also give him a chance to investigate the soil, climatic, and other conditions necessary for the successful growth of his vetch.

W. H. BULLOCK.

"My dog took first prize at the cat show." "How was that?" "He took the cat."—Columbia (University) Jester.

"MARIA," said the mistress to a favorite colored maid, "when's your birthday?" "Ma burfday, missis? I ain't got no burfday." "Why, Maria, of course you have a birthday. Everybody has a brthday." E. Frank Coe Fertilizers

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS **1914**

RAISE CORN AT 12c A BUSHEL

This is what Mr. L. S. White of Connecticut did in **The Coe-Mortimer $500.00 Corn Contest in 1911.**

You remember that the competition was for the **most profitable acre of corn** raised in New England.

You probably remember also that **The Coe-Mortimer Company** had nothing to do with the judging or with the awarding of the prize. This was all done by a disinterested committee from the Massachusetts Corn Show, and the records were approved by The Director of The Connecticut Agricultural Experiment Station.

E. FRANK COE FERTILIZERS will help you to equal this record. Perhaps you can beat it.

It cost Mr. White just **$42.-50 to raise his corn.** (Official figures.)

The committee valued the 7733.9 pounds of stover produced at $8.00 per ton, amounting to $30.93.

The difference between $42.-50 and $30.93 is $11.57; and this is what it cost Mr. White for the 97.9 bushels of shelled corn (12% moisture) raised on his acre. (Official figures.)

Figure it out for yourself: 97.9 bushels of shelled corn cost $11.57—one bushel cost $11\frac{8}{10}$ cents; or in round numbers **12 cents per bushel.**

If superior goods and superior service interest you, write to us promptly.

$1,000.00 Prize Cup for Best Corn Raised in the United States. Won at the New York Land Show, 1911, by Mr. Wm. H. Dorin of Virginia, a user of Coe-Mortimer Fertilizers.

John Deere Two Way Plow

The Sulky with the Steel Frame and Patent Auto Foot Frame Shift.

A Few Strong Features

1 **All Steel and Malleable Frame—Steel Arch:** Strong—Light—Durable, Alignments Permanent.

2 **Patent Auto Foot Frame Shift:** Perfect Control—accurate width of cut.

3 **Long Malleable Beam Clamps:** Beams held rigid—uniform cut.

4 **Automatic Shifting Hitch:** Clevis always in position. Correct line of draft.

5 **Automatic Horse Lift:** Pull of team raises bottoms.

6 **Adjustable Jointers:** Clamped to beam. Every adjustment.

7 **Wide Tread:** No tipping on hillsides.

8 **Chilled, Full Steel and Combination Bottoms:** Every style for Eastern conditions.

9 **Removable Shin Piece:** Keen cutting edge—easily renewed.

Send for John Deere Two-Way Book—Handsomely Illustrated in colors—Free.

A BOOK FOR YOU—FREE

"Better Farm Implements and How to Use Them" was written for you. It contains 169 pages of money making ideas. It cost us a large sum to produce. It is yours for the asking. Send for package No. T. W. 33 before they are all gone. A post card will bring you your book.

John Deere, Moline, Ill.

Light Draft

THIS disk harrow saves 25 to 50% in power

Which means it saves one horse at the very least. It also saves one man. And, furthermore, this

Cutaway (CLARK)

Double Action Disk Harrow

pulverizes the soil finer than any single harrow working in "half-lap." And more—it pulverizes finer than any two single harrows attached in tandem. Its rigid main frame holds the rear disks so that they cut just midway between where the fore disks cut. All soil is pulverized to the full depth to which the disks are run. Ask your dealer to show you a Cutaway (Clark) Double Action. If he doesn't sell Cutaway (Clark) harrows, write us. Don't accept a substitute. We ship direct where we have no agent. Ask for free catalog, "*The Soil and Intensive Tillage.*"

The Cutaway Harrow Company

Maker of the original CLARK disk harrows and plows

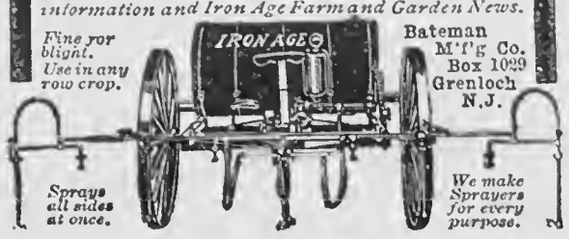
Something New In Traction Sprayers

Sprays 4 rows with 12 nozzles, 3 on each. 8 are low-down nozzles for still more thorough spraying of sides and underside of vines. Spraying saves your crop and *increases the yield.* One of a dozen

IRON AGE FOUR and SIX-ROW

Traction Sprayers, 55 or 100 gallon wood tanks, double or single acting pumps, wind shift, nozzles, strainers, thorough mixing, no corrosion. Ask your dealer about them and write us now for *new "Spray" book, spray information and Iron Age Farm and Garden News.*



Fine for blight. Use in any row crop.

Bateman M'f'g Co. Box 1029 Grenloch N.J.

Sprays all sides at once.

We make Sprayers for every purpose.

Care of Old Orchards.

What would you do to an old apple orchard? It was plowed last Fall and needs cutting back. J. L.

Massachusetts.

It is, of course, impossible for an outsider to give definite rules about handling trees of this kind. A man ought to see the trees and study them before trying to tell just how they should be handled. As general advice we would begin May 1 on this plowed sod, and harrow once a week, up to July. A spring-tooth would be a good tool for this purpose. Then sow six pecks of buckwheat, and 10 to 15 pounds of Mammoth clover to each acre. If the trees are in bearing we would let the buckwheat mature, then cut it and let it remain on the ground. This would make a fine run for the hens.

As for cutting these trees back, we would rather take three years to dishorn them, rather than to do it all at once. Good judgment is required in doing this work, and it will pay you to get some good fruit grower to come and cut back two or three trees for you, to give you an idea of how it should be done. We would not cut the top all back this first year, unless there were good limbs and water-sprouts below the place where you cut.

Moving Bees.

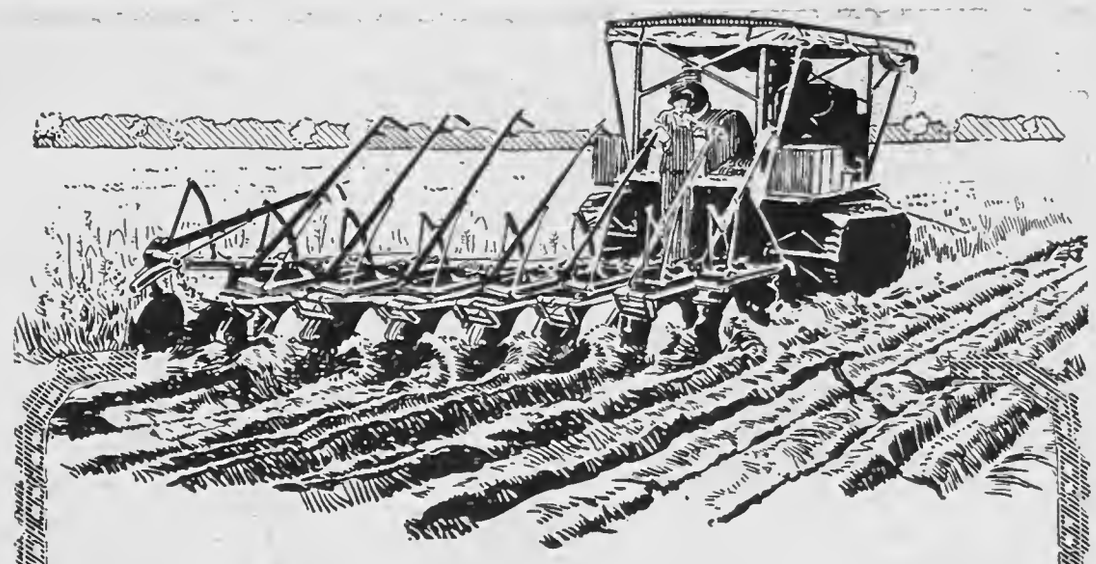
I have two hives of bees, but the hives are so old they are no longer fit for use. I wish to take the bees from the old hives and put them into new ones. Is it possible to do this? If so, how can it be done? V. K.

Carpenter, Del.

There are several methods of transferring bees from one hive to another, of which that known as Heddon's short method is probably as simple as any. The transferring should be done when some honey is coming in, and you should now wait until about fruit blooming time in the Spring. Then prepare your new hive with frames fitted with foundation or foundation starter and also make a box about eight inches deep, without cover, and just large enough to fit the bottom of your old hives without slipping down over. Don veil and gloves and with lighted smoker in hand give the bees a few whiffs of smoke at the entrance of the old hive, then remove the hive from its stand, setting it back several feet. Place the new hive on the stand of the old, with entrance facing the same way. Then go to the old, turn it bottom side up and cover the bottom with the box that you have made, open side down. With two sticks drum upon the sides of the hive until most of the bees have gone above into the box. They may then be carried to the new hive on the old stand and dumped in front of the entrance. As they run in watch for the queen, for she must be with them if they are to stay. If you do not care to trust to finding her as she goes in with the bees, you can place a zinc entrance guard in front of the opening before dumping the bees and this will keep the queen outside until the rest have gone in, giving you a chance to see her. If need be, drum the old hive again until you have got most of the bees and the queen. Then set the old hive about two feet in the rear of the new, with the entrance at right angles with that of the new. Leave it for three weeks, or until the brood in it has hatched, then turn it bottom side up and drum the bees out again, as before, and carry these to the new hive, dumping them in front of the entrance. Before doing this, smoke the bees in the new hive lightly so that they will admit the newcomers. A newly-hatched queen may go in with the second installment unless you again use your entrance guard, but unless you wish to preserve the old queen, it does not matter which one survives the conflict which will ensue.

I have transferred bees by removing the cover of the old hive and replacing it with my new one minus its bottom, and then drumming the bees directly up into the new hive and carrying it to the stand of the old hive. This is a shorter short method, but in order to use it the bottom of the new hive must fit the top of the old, or be made to, by use of strips of wood. M. B. D.

"Is she good-looking?" "Well, if faces were fortunes, she wouldn't have to pay much of an income tax."—Winnipeg Telegram.



Works in Rain or Heat

The 60-h. p. Caterpillar works anywhere—in rain or heat, in slippery or soft ground—in swamps if necessary. It will plow when you want to—as deep as you want to. It will disc, harrow, haul, build roads, fill silos, saw wood and pull stumps or trees. It is a wonderful power for loggers.

CATERPILLAR

Reg U S Pat Off

It is the only real substitute for the horse or mule—because it does its work on any ground and in any weather—without the labor cost or expense for feed, harness and barns. Those things which horses cannot do at a profit—threshing, shredding, baling, shelling, etc.—the Caterpillar will do with the greatest of ease.

The Caterpillar lays its own track—rolls over it—picks it up again. It is always running on a smooth steel road-bed. It never packs the soil—it exerts less pressure on the ground than a mule—less even, than a man. It can't mire down—the tracks hold it up the way a board over a mudhole holds up the weight of a man.

The Caterpillar is built right. Our forty-three years of manufacturing experience has taught us how. Every part is carefully inspected. Breaks are thoroughly guarded against.

Send for Catalog A.I. 20. Learn more about the Caterpillar—about the many kinds of work it is doing all over the world—Learn the number of Caterpillar owners—and investigate what it does for them. Find out about Holt Service with its repair stations everywhere. Write to-day.

EVENTS OF THE WEEK.

DOMESTIC.—The largest Federal income tax in Chicago will be paid by Julius Rosenwald, president of a mail order house. His return showed an income of $1,100,000 for the ten months ended December 31, 1913, or on a basis of $1,320,000 for twelve months.

During a blizzard, March 31, the Newfoundland sealing fleet met with great disaster. The steamer Newfoundland lost 77 of her crew, while as many more, it is feared, will be maimed as a result of exposure. The men lost were far from their ships, killing seals, when the storm, with blinding snow, swooped down upon them. They were exposed for 48 hours before assistance arrived and in that time many succumbed. The Newfoundland was one of a fleet of fifteen ships, carrying more than two thousand men, scattered among the ice floes near Belle Isle Strait. Another vessel, the Southern Cross, disappeared in the storm, and it is feared all on board, 175 men, are lost.

The twelve districts and twelve reserve cities of the Federal reserve banking system authorized by the new currency law were announced by the organization committee April 3. The cities to have Federal reserve banks are New York, Boston, Philadelphia, Cleveland, Richmond, Va., Atlanta, Chicago, St. Louis, Minneapolis, Dallas, Tex., San Francisco and Kansas City. Twelve districts are outlined with these cities as financial centers, it being required that the reserve bank of each district shall subscribe to a minimum of $4,000,000 of capital in the reserve system.

Fire which swept through two blocks along the bay shore at St. Augustine, Fla., April 2, destroyed 36 buildings, among them five hotels crowded with visitors from the North. There was only one death, although hundreds of persons had narrow escapes as they fled in their night clothes. The loss is estimated at between $600,000 and $700,000.

Nine men were killed and nine others narrowly escaped death, April 6, when a shaft leading to the underground workings on the foundation for the Harahan Bridge, being constructed across the Mississippi River at Memphis, Tenn., became filled with poisonous gases.

August Pajonk, alias August Miller, alias Albert Frei, alias Fred Klein, was recently sentenced in Chicago to two years in the penitentiary for obtaining money under false pretenses. Pajonk's plan was to advertise florists' stock for sale in the trade papers, and then make no return for the money.

Secretary of the Navy Daniels has signed an order which absolutely prohibits the use or introduction of alcoholic liquor upon any vessel of the navy yard or shore station. This order will become effective on July 1, 1914.

Mrs. Lillian M. N. Stevens, president of the National Woman's Christian Temperance Union and vice-president of the world's organization of the same name, died at her home at Portland, Me., April 6, of kidney disease. She had been ill since her return in December from Washington, where she had worked hard in the campaign for a national prohibition. law. Mrs. Stevens was born in Portland on March 1, 1844. Her maiden name was Ames. In 1867 she married Michael Stevens, a merchant of Portland, and in 1874 assisted in organizing the Maine W. C. T. U. From 1894 to 1898 Mrs. Stevens was vice-president of the National W. C. T. U., and after the death of Frances Willard she was elected president in 1898 at St. Paul. Since then she has been re-elected president each year.

Elections on April 7 resulted as follows: By a vote only one-sixth normal in the special election this State favored a constitutional convention. With President Wilson's administration the principal issue Dow J. Drukker, Republican was elected to Congress in the 7th New Jersey District, to succeed the late Robert J. Bremner, a Democrat. Emil Seidel, Socialist, was defeated by at least 5,000 for Mayor of Milwaukee, by Gerhardt A. Bading, non-partisan candidate. The Democrats retained the 12th Massachusetts District, electing Gallivan to succeed Curley, who is Mayor of Boston. The Republicans and Progressives ran in the order named. Kansas City elected a Democratic Mayor. Every one of the nine women candidates for seats in the City Council of Chicago was defeated. Throughout the State of Illinois the women carried a number of offices. The drys gained a number of larger towns in Illinois. The wets gained none, but retained control of several big cities. The drys in Illinois made substantial gains with the aid of women's votes in the local option elections. With now and then an exception, women voters more than offset the men, who generally rolled up majorities for the saloons. An impressive example of women's power was disclosed in Fulton county, where, with the carrying of Canton, the largest city, by over 1,000, and smaller places by lesser figures, the women swung the entire county into dry territory and put thirty-eight saloons out of business.

FARM AND GARDEN.—June 6 will be "Rooster Day" in Missouri. At that time, if the direction of T. E. Quisenberry, director of the Missouri poultry experiment station, are carried out, every Missourian will destroy surplus roosters. Prof. Quisenberry claims that the roosters of Missouri cause a loss of $3,000,000 to Missouri farmers every Summer. He insists the roosters should be exterminated as soon as the hatching season is over.

Nine hundred quarts of milk were given away free to a crowd of nearly 1,000 men, women and children at the State House steps, Boston, April 6, by the North Reading milk farmers, who charge that their product is going to waste because the big milk dealers will not pay them a fair price. A delegation of the farmers waited upon Governor Walsh to complain of the situation.

Henry Jackson Waters, president of the Kansas State Agricultural College, will spend 60 days this Summer in the Philippine Islands as a special representative of the United States to inspect the work being done by the Bureau of Agrienlture and Education and will make a report of the same to the War Department.

Wheat 95; oats 40; corn, short crop, and sells at all prices, from one cent per pound to 1¼ cents. Hay, clover, $9; mixed, $10; No. 1 Timothy $11.75. Eggs 15; butter, creamery 22; dairy 18; apples searce; selling from fruit stands, six for 25 cents. Spraying not common here. I have a few apples yet from small orchard, which was sprayed. Cows from $50 to $80 for common; other cattle, none moving to speak of. I have 75 head in all, including calves; 27 two-year-old steers, not ready for market. Several farmers feeding lambs, but none selling yet; hogs $8 per hundred on foot. Potatoes not raised for market here, some with garden crops. G. M.

Edon, O.

Cold and rainy; no spring farm work done as yet. Farm horses are worth from $200 to $300; good milch cows $75 to $100; purebred stock higher; dressed pork 11½ cents per pound; chickens 16 cents live; eggs 20. Milk eight cents per gallon; retail seven cents per quart. Best quality dairy butter sold to customers at creamery prices 34; at stores 26. Potatoes 85; cabbage four cents per pound; parsnips 1½ cents per pound. Hay $16 per ton; corn $20 per ton; wheat 95 cents per bushel; oats 42.

Elyria, O. J. S.

Snow having melted by March 20th, with a nice, warm sun George Green was able to till four acres of ground and plant early peas on March 25. The ground around here is a warm sand and the snow does not last long. While North Jersey had about four foot of snow, the heaviest fall around Millville was eight inches. H. S. M.

Burlington Co., N. J.

March will be remembered as one of the old-fashioned kind, cold, blustery, and plenty of snow drifts to open up. It has been a tax on the town to keep the roads open for mail carriers. Reports say we will have a poor peach crop. Eggs have taken a sudden drop to 18 cents; butter 24; potatoes 55; wheat 95; oats 40; corn 80; barley 68; mixed hay $12; bran $30. Veal 9½; pork 8; lambs 7; wool 16 to 18. Red Beans $2.25; apples, per bushel, $1; clover seed $10; Timothy seed $3.50. Good seed corn that has been tested and gives 95 per cent germination $1.25 per 60 pounds. E. T. B.

Canandaigua, N. Y.

It is very wet here now, and the Ohio River looks like the beginning of a small flood. Fruit growers are making a good start in spraying, and several carloads of lime-sulphur have been sold in this locality and more than a car of dry sulphur for making the mixture at home. Six carloads or more of fertilizers are being brought in here for the orchards this Spring. The prospect for all kinds of fruits was never better for the time of the year. Most of the peach buds are alive and strong and more backward than usual. Mice have done more damage in this locality than ever known before. Most of it was done during the snows about a month ago.

Proctorville, O. U. T. C.

Bargains Snapped up Quick Like This

Good land—217 acres. Two sets bulldings; one house worth $4,000; in fine shape. All kind of hen houses. Four big barns; corn crib; big orchard and other good house buildings, worth twice price asked. 3 miles to Railroad town. If sold this month only $4,000. Easy terms. Hay this year will pay near half price asked. Can run anto over it, lay so good. Now, do you want it? HALL'S FARM AGENCY, Owego, Tioga Co., N. Y.

ROOFING COST

This is a point every farmer should consider carefully—the original purchase price means little, but figure out what the roofing cost per year will be. The cheapest roof that lasts only a year or two may prove the most costly in the long run—this is usually true.

"RAIN-TIGHT" Rubber Roofing

lasts almost indefinitely, and, counting the length of service, it is the most economical roof you can buy. It is made of Trinidad Lake Asphalt—the standard asphalt of the world. It is the same material that is used to make city pavements, which withstands the constant pounding of horses' hoofs and heavy-laden wagons.

Our brand of "PERFECT ROOFING" is the same as "RAIN-TIGHT" with Mica Flakes added to the surface, which make it fire-resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof.

PERFECT ROSIN-SIZED SHEATHING AND PERFECT-TARRED FELT ARE BEST FOR SHEATHING PURPOSES

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us to-day.

MAURICE O'MEARA CO., 448 Pearl Street, New York City

It's a Pleasure to Farm in the South

NATURE coöperates with you at every turn in the Southeast. Crop failures are hardly known.

You are favored with 200 to 300 growing days, which allow two and three crops from the same land each season.

Expensive irrigation is unnecessary, as 45 to 60 inches of rain, well distributed through the growing season, fall annually.

The assortment of crops raised in the Southeast is the greatest anywhere in America. From the tropical citrus fruits to the finest varieties of apples, peaches, pears, grapes and numerous other fruits and nearly every known variety of grains, vegetables, grasses and legumes can be produced somewhere in the Southern Railway territory.

And with all these superior advantages Southeastern land now averages less than one-half the price of farms in other parts of America.

$15 to $50 An Acre Buys Excellent Homesteads

where the climate is exceedingly agreeable and healthful, where railroad communication is of the highest order and transportation to Northern markets but 24 to 48 hours.

Life in the rural sections of the South is all that could be desired. Modern highways and telephones, the best of high and agricultural schools, good churches and trading centers—all these advantages are to be had in this growing section.

INVESTIGATE SOUTHERN CONDITIONS

Avail yourself of the low Homeseeker's Rates. Write for particulars. Learn of the favorable conditions in the South. Ask for the "Southern Field" magazine, state booklets on Virginia, North or South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee and Kentucky. Let us know the state and line of farming in which you are interested.

400,000 Settlers a Year

Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in Manitoba, Saskatchewan and Alberta.

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent.

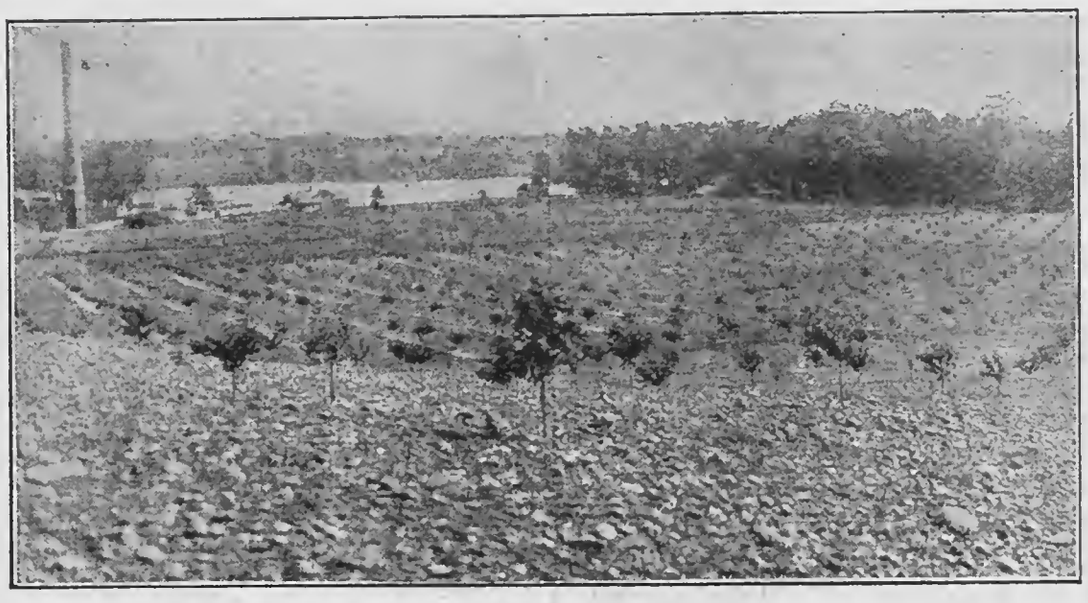
A MODERN SOUTHERN MICHIGAN ORCHARD.

By model the writer does not mean a small imitation of the real thing, which is the dictionary definition. But on the shores of Baw Beese Lake, Hillsdale County, Michigan, is a small orchard of about 11 acres, only one year from planting, that bids fair to be all that can be desired in the way of a profitable and pleasurable fruit venture. Situated upon a hill which slopes to nearly every point of the compass, with soil running through all gradations of stone, sand and black loam, this orchard will have as great a variety of growing conditions as might be found in several counties. And yet,



A WELL PLANNED ORCHARD IN SOUTHERN MICHIGAN.

the growth of the trees does not indicate, as yet, that difference in soil has made any difference in growth.

This land is owned by a man whose business calls him constantly out into the State, thereby making it necessary that all the labor be hired labor, but the owner has such an interest in this orchard that he is making sure every modern method of cultivation and fertilization is used. It is intended eventually that practically all of it will be an apple orchard, but at present peaches are used as fillers. About an acre right on the shore of the lake is devoted to grapes, and they have been so planted and cared for along straight lines that they make as pretty a picture as a flower garden. Another piece of about an acre will contain fruit of practically every kind for home use only. The trees were furnished by a prominent Michigan nursery firm, and the head of the company came personally to test the soil and see the ground before a tree was ordered. He was very enthusiastic over the outlook in Hillsdale County for future fruit farming, saying it was splendidly adapted to commercial peach and apple growing, and showed surprise that more farmers were not utilizing the hill slopes—and a large part of the county is such—for fruit growing.

About 1,300 trees of the first size and quality were planted, an expert being sent from the nursery to do the work. Of the entire quantity planted not over six have died, and five of those that died were planted in standing water, as there remained a little drainage work to be done at planting time. The trees have made an astonishing growth during the past season. A couple of months after planting, tree protectors were purchased at a cost of $5 a thousand and placed on the trees. These were made of wood such as is used in berry boxes, and are a great help to the tree, not only from the gnawing of rabbits, but also from the burning of the sun and any other causes that might injure the tender tree trunks.

One of the remarkable things about this orchard is that no fertilizer was applied previous to planting. The year immediately preceding the ground was in corn, and preceding that was part hill pasture and part swamp grass, but evidently the soil was rich enough, for the growth has been all that could be expected under the most favorable conditions. Cultivation has been kept up throughout the Summer in both directions, and not a weed has ever been seen. In late September 30 pounds of vetch and two bushels of rye were sown to the acre, which made a fine stand before snow came. This will be plowed under the coming Spring, and probably no further fertilizer will be applied until the trees show the actual need of it.

This is to be strictly a commercial orchard on a small scale, and every up-to-date way of picking, packing and marketing the fruit will be used. The intention is to show just how good fruit can be produced on our Southern Michigan soil, and it is hoped that a great number of farmers will plant such orchards, and in such quantities that the fruit-buying public will turn naturally to Southern Michigan as one of the great fruit sections. P. L. W.

Michigan.

POTATOES FOLLOWING STRAWBERRIES.

Would you advise planting potatoes on land occupied by strawberries last season? I have never raised these crops in succession and have wondered whether potatoes would tend to grow scabby on such land because of the berries taking the acidity from the soil. L. H. R.

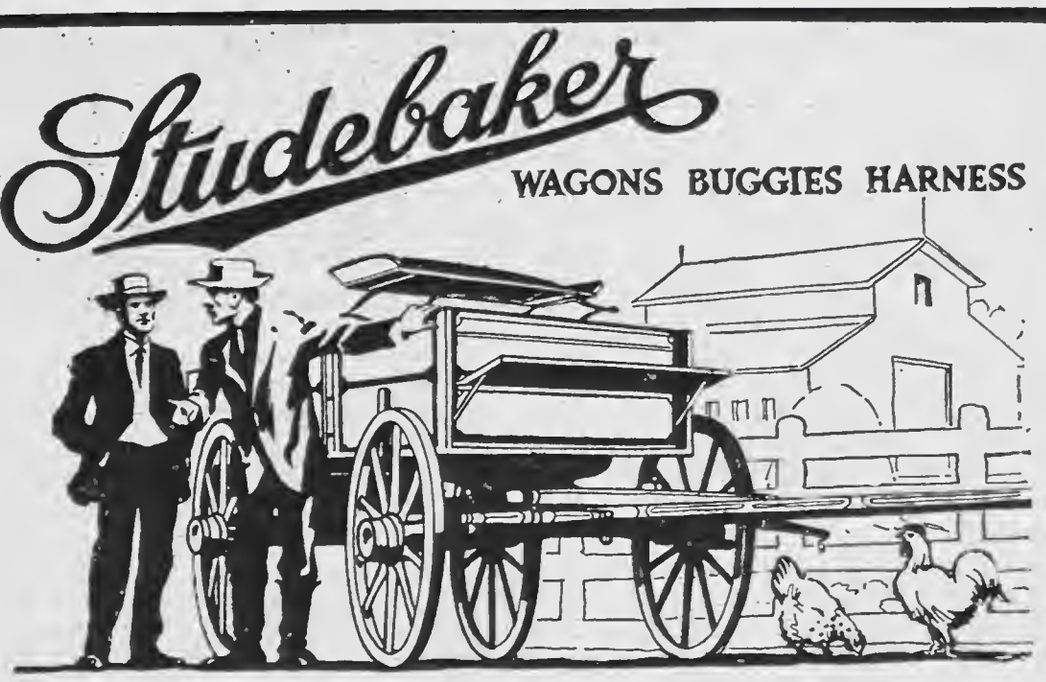
Harwinton, Conn.

Yes, potatoes will do well after a strawberry crop. The land where strawberries are grown is usually rich. Large quantities of manure are generally put on the strawberries for mulching, and when this with the plants is plowed under the soil is filled with humus, a condition which just suits the potato crop. The acid condition of the soil is what is needed to prevent the spread of potato scab. The germs of this disease thrive and spread best in an alkaline soil. In an acid soil they do not develop, while the strawberry crop makes its best growth on an acid soil. Thus a soil where strawberries have done well would be less likely to spread the disease of scab. We should go ahead and plant the potatoes on this soil.

DENTIST: "Have you been anywhere else?" Patient: "I went to see the chemist in our village." Dentist: "And what idiotic advice did he give you?" Patient: "He told me to come and see you, sir."—London Opinion.

Studebaker

WAGONS BUGGIES HARNESS



Outdoors for forty years painted once-carries five tons today

WHEN Mr. Peter Kern, Jr. of Reese, Mich. bought a Studebaker wagon, thirty-two years ago, the wagon had been working for eight years. This means that it has now been in use forty years.

A letter from Mr. Kern says:

"I bought my Studebaker from Henry Daley thirty-two years ago. The wagon has never been housed—always out in the open air and has had but one coat of paint in the forty years.

I have used this wagon to haul sugar beets, four tons at a time, over country roads. The material in the wagon is as hard as a bone.

In 1881 I bought more land, giving me a total of 340 acres, and my old wagon with one other Studebaker I bought fifteen years ago, has done all the hauling.

I will guarantee my old Studebaker to deliver 5 tons today. I am satisfied that the Studebaker is the best farm wagon in the country."

MADE OF THE RIGHT MATERIAL

This letter proves that Studebakers use good paint on their wagons, but the real reason for the long life of Mr. Kern's wagon is the material underneath the paint. Nothing but the best of everything is used in Studebaker wagons.

You can buy today a Studebaker wagon that will last you just as long and give you just as faithful service as the wagons Mr. Kern and others describe.

You may be offered a wagon represented to be "just as good as a Studebaker"—and at a lower price. Don't be fooled. It is the life of a wagon that counts. Studebaker wagons are the cheapest in the end.

Remember Studebakers have been building wagons for over sixty years and they know how to build wagons that will last longest and give the most satisfaction.

The same thing is true of Studebaker Buggies and Harness.

Planet Jr

No. 3 Planet Jr Hill and Drill Seeder

Sows all garden seed accurately in hills and drills. Sows in a narrow line making wheel hoe cultivation quick and easy. Sows in hills 4, 6, 8, 12 or 24 inches apart. The seed index, graduated for both hills and drills, is always in plain view.

Planet Jr Farm and Garden Implements cut down the cost of cultivation, lighten labor, and give better results. $2 to $100, according to requirement. Fully guaranteed.

FREE Our new 72-page illustrated catalogue describing 60 implements for all kinds of cultivation. Write for it today.

S L ALLEN & CO
Box 1107V Philadelphia

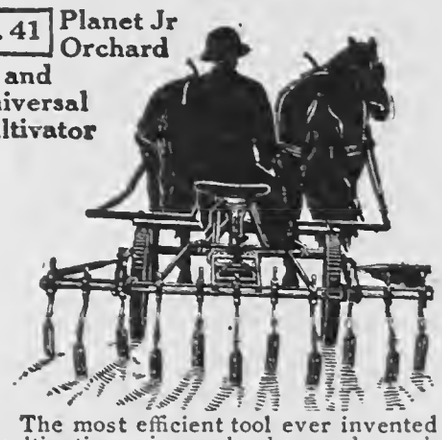
Immediate Shipment Guaranteed

No. 11 Planet Jr Double Wheel Hoe, Cultivator, Plow and Rake

The greatest cultivating tool in the world for the grower of garden crops from drilled seed. The plow opens furrows for manure, seed, etc. and can be reversed for covering. The cultivating teeth are adapted for deep or shallow work and for marking out. Crops can be worked both sides at once until 20 inches high.

No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel Hoe, Cultivator and Plow

This is a practical every day time-, labor-, and money-saver for the woman in tending her vegetable garden as well as for the market-gardener. It combines in a single implement a capital seeder, an admirable single wheel hoe, furrower, wheel cultivator, and a rapid and efficient wheel garden plow. Sows all garden seeds in drills or in hills.



No. 41 Planet Jr Orchard and Universal Cultivator

The most efficient tool ever invented for cultivating vineyards, hopyards, and orchards of apple, citrus, olive and groves of orange, walnut, etc. It is equipped with fruit tree shield and side hitch for low trees. Carries teeth, sweeps, furrowers, plows, etc. Works deep or shallow and cuts from 4 to 6½ feet wide. Convertible into disc harrow and alfalfa cultivator.

Planet Jr 12-tooth Harrow, Cultivator and Pulverizer

An invaluable tool in the market-garden, truck and strawberry patches. Its 12 chisel-shaped teeth cut out all weeds, stir and mellow the soil and leave the ground in the finest condition without throwing dirt on plants. Can be set exactly to desired depth making delicate work easy.

Hope Farm Notes

On the New York police force there is a company of picked men known as the "strong-arm squad." They are big, husky fellows, ready to tackle anybody or any job. When there is liable to be a riot, or when toughs try to terrorize a neighborhood, these "strong-arm" men get into action and go where they are needed. The gasoline engine has become the "strong arm" of the farm. I can remember the time when manufacturers laughed at the idea of making an engine of less than five horse-power. Even that power was a ponderous, heavy thing, that could not be easily transported. I was a hired man in those days, and had to play the part of "strong arm." I know what the small gas engine has done to take up this burden.

The engine on our power sprayer pumped water and blew it out as spray faster and better than any hired man ever could. Even the boss would grow weary on the spray pump after a few hours' work, and the sprayer would be more like a squirt-gun than a prodneer of fine mist, which a spray ought to be. After spraying was over the "strong arm" would have stood idle if it had been confined to the single job. A loafer is a nuisance on any farm. So is the character that claims the right to a long vacation because it has done its duty at one hard job. So we lifted strong arm off the sprayer and mounted it at the well, near enough to be belted to the pump. The windmill lifted the water when the air was strong. When a calm fell upon us with an empty tank the little engine rolled up its sleeves and got on the job. Air is cheaper than gasoline, but it does not always move when you need it. The two together make a fine team. Then when the Summer's supply of wood had been hauled from the hill in 10-foot sticks there came another job for "strong arm." We bought a saw, moved the engine up near it, set it going, and these sticks were chewed up into firewood, while the redheads and their comrades piled the chunks in the shed. There are half a dozen other things which strong arm could do. It can turn the feed grinder or grindstone, or run the cutter to chop up the stalks, or slice the mangels. It is a great farm helper, and no one can realize its convenience until he has tried it out. It is a great educator when you can stand at ease and see this strong arm doing the work which formerly took the starch out of your own back.

When the wood was cut up the engine was lifted back upon the sprayer, ready for its original business once more. There are new types of sprayers, so arranged that the engine cannot be taken off. The manufacturers do this purposely, as they claim the engine should not be used for any work except spraying. We have found that a *good* engine is suitable for these different jobs, and I would rather keep it at steady work. Spraying thus far this season has been a slow, interrupted job. Winds and rains have been frequent, and we have been obliged to take advantage of a few hours of suitable weather here and there. As usual, we spray the apple trees with soluble oil and lime-sulphur on the peach trees. I know, of course, what some of the scientific men say, but experience tells us that the oil solutions spread better on older, rough-barked apple trees, and are more likely to get at the scale in the fuzz or fur-like growth around the bud. I have no quarrel with the lime-sulphur men; there is nothing to quarrel about. We like the oil for apple trees and use it. The lime-sulphur is excellent for peach trees—not only cleaning out the scale, but destroying the germs of curl-leaf and brown rot. It should have gone on before this, however, to do much good with brown rot.

This season there have been many questions about time and quantity in the spraying business. Therefore we have been doing some figuring. For filling the tank our plan is to drive alongside a little pond or pool and use the tank-filler. Our pool is formed by putting a dam across a little spring brook. The tank filler is put on a piece of plate at the bottom of this pool, the upper part attached to the pump, and the engine started. With this system it requires about eight minutes to fill the 250-gallon tank. Our apple trees are about 30 years old, I should judge—good-sized Baldwins. Between four and five gallons of spray are required to cover them well. The time required to spray such a tree will depend on many conditions—wood, shape of tree, pressure, and half a dozen other things. Far better take more time and do a thorough job, for if you leave a few parts of the tree untouched the scale insects will spread like a fire over it. Spraying for the scale is not like fighting the Codling worm. You must *hit* the scale with the spray mixture; it will not crawl up to any poison and eat it. There seems to be little doubt that the scale insect is weakening in our neighborhood. Yet this is no time to stop spraying. Rather make a rally and clean them out. As for fruit, we are at this moment promised a good crop of peaches and a small crop of apples.

The strawberries are very promising as Spring begins her tardy preparation. The heavy snow on top of the mulch gave the plants a good chance. They begin to crawl out of bed and stretch themselves, like one who has had a good rest and is now ready for a great day's work. I find some demand for Marshall plants, though we make no effort to "boom" this variety. It will probably fail to satisfy seven times out of 10 in ordinary soil and with ordinary culture. When you get it right, however, there is nothing finer. We are trying a few others this year—Joe, Chesapeake and Progressive. We have had Chesapeake before. It is a fine berry for hill culture. Joe is highly praised for its quality and its ability to produce on rather poor soil.

BIG STORIES.—Not long ago I printed a newspaper story about a Washington apple orchard which averaged $3,235 per acre for seven years. Now comes one of our readers in Wenatchee, asking me to print the following statement from the local paper, *The Daily World:*

An erroneous report is going the rounds of Eastern farm journals and other papers, bearing a Wenatchee date line. It tells the astounding news that L. W. Smith has averaged $3,235 per acre from his five-acre orchard on North Wenatchee avenue for seven years. The skepticism with which this report is commented upon in the East is not to be wondered at. The fact is that owing to a misprint, we should judge, the amount is given as per acre when it should have said per year. At any rate, we are in possession of the fact, and it is true that five acres of apple orchard has averaged $3,235 per year for seven years.

This paper claims that in 1911 O. G. France received $3,964 from one acre of Winesap apples, and that local growers average 500 boxes to the acre! The man who sends this says that from his own eight acres—10 years planted—he picked and sold last year 3,140 boxes of apples. I feel sure that some of our South Jersey and New York growers can match that. We have one field at Hope Farm with a little over one acre. There is a fringe of apple trees around it, with strawberries in the center. Last year this field gave us 175 barrels of Baldwin and Spy apples, and about $250 worth of berries and plants. The berry plants were three years old. There will be a fourth picking this year.

"RAW PHOSPHATE."—We have had several articles about the use of raw ground phosphate rock. Recently a Pennsylvania man asked if it would pay him to use sulphuric acid on the farm to "cut" this rock. Our answer is "No, it is too dangerous." Now comes a Michigan man with the following:

If J. O., page 37, will put his raw rock phosphate through the manure pile he will get just about the same result as if it was treated with sulphuric acid, provided there is enough horse manure in the pile to cause chemical action. A good way is to sprinkle the phosphate behind the animals and allow it to soak up the liquid; keep the manure pile wet enough to prevent burning and loss of ammonia, but allow it to be warm enough and wet enough to cause the change in the phosphate. Haul the manure to the field about once a month. J. A. V.

Where is your authority for any such statement? I have read several experiments at our government stations where this thing was tried. Careful chemical tests seemed to show that the manure had practically no effect upon the raw phosphate. H. W. C.

Save Money on the Cost of Your Home

Get full measure of Home value Cut down your building cost. Free yourself from exorbitant lumber prices and the expensive, old-fashioned way of building. Send for Lewis plan book. It shows the modern way.

Lewis Easy-Built Homes are shipped direct to you—ready to put up. Every piece is sawed and worked to fit. The planning, designing, all the detail of figuring is lifted from your shoulders. You save your own time, architects' fees, contractors' profits and get a better home.

$248.00 and up. Lewis Easy-Built Homes offer you a big choice of cottages, bungalows and dwellings of all kinds—each a masterpiece of construction. Shipped complete direct to you—Easy-Built Homes are made of the best grades of lumber. At our prices we furnish all lumber, millwork, hardware, paints and plaster—all sawed and worked to fit, ready to put up. Complete working plans with each house. Lewis Easy-Built Homes are easy to erect.

Send for Money-Saving Book. If you are going to build send for the Lewis Easy-Built book. It shows you every kink of the building game. It tells you how to build efficiently—better and for less money. Get this valuable book. Every home builder should have it. A postage stamp will save you many dollars. Send for book today.

LISTEN! Friends and Neighbors While I Tell You About the Greatest Engine in the World

Galloway engines are built on honor. Quality first and price second is my motto. When I get the quality as high as I can I jump in and force my price down as low as possible.

That's why the Galloway is a better engine at a lower price than you can get anywhere else in the world. It's simple in construction. No confusing levers. No unnecessary parts. No complicated adjustments. It's the engine for you. A crackerjack farm engine that eats up work.

Fifty thousand farmers, contractors and others are using Galloway engines. They bought on free trial, the same as you can, and kept my engine because they couldn't afford to be without it.

Write Me, Get My Catalog, Price and Special Offer

Learn why my business climbs every year, why Galloway engines are used in every part of the United States, in Canada, Mexico and thirty other foreign countries. My new engine book—free for the asking—proves that I save you from $50 to $300. Immense output, careful material buying and direct selling do it. Special electrical and other automatic machinery trebles my output without increasing my expense. I have saved other engine buyers from two to three million dollars.

Prices Lower Than Ever

Galloway engines are high-grade, 4 cycle, water cooled engines with hand turned cylinders, battery ignition, hit-and-miss governor, and every feature that modern engine building can produce. My 5 H. P. engine, selling at $99.50 has 5 1-2 inch bore and 10 inch stroke. Other built in the same mechanic-like proportion and sold a proportionate direct-to-you low prices.

Ask your neighbors about the Galloway. Or sit down and order a Galloway sent to you on 30 days' free trial with 5-year guarantee. $25,000 bond backs my guarantee.

Free Service Department

I have pulled my prices down to the lowest possible notch but I don't stop there. I want you to be just as pleased after you use my engine as when you get it. So I maintain a service department of engine experts who will answer any question relating to ignition, carburetor adjustment, timing or any of the other points of engine running. You can run my simply designed Galloway engine without knowing these things, but knowing them enables you to get 25 to 50 per cent more work out of it. No other engine maker can give you the engine advice that comes from my corps of trained engine experts. Free to Galloway users.

Free Engine Book Describes and illustrates every Galloway engine. Quotes prices that make you wonder how I can do it. Shows everything from 1 3-4 H. P. pumping engine to our 15 H. P. heavy duty portable engine. Anything you want—and at the lowest price on earth.

Free Proposition Let me tell you how you can get a gasoline engine, cream separator, manure spreader or any other Galloway article partly or entirely without cost to you in the end. No agency scheme. Write for engine book and details of plan. Address

Wm. Galloway, Pres., William Galloway Company
275 Galloway Station, Waterloo, Iowa.

Fraver Says

I am well pleased with my Buckeye Machine—it is all that you claim. I have done an average of $400 worth of work a month. I have dug 1162 rods in 6½ days, 247 rods in one day and 66 rods in two hours. It cost me 2⅛ cents a rod and I received eighteen cents.

ALFRED FRAVER
Fostoria, O.

BUCKEYE TRACTION DITCHER

A perfect trench at one cut

has put hundreds of men into independent and profitable businesses. In every farming neighborhood there is a splendid opportunity for contract ditching. Even at 100 to 150 rods aday, the profit is from *$15* to *$18* daiiy and most men are busy nine or ten months a year.

Send for the Buckeye Book of Facts No. 3, and see what other men are doing and what you can do. Write today.

The Buckeye Traction Ditcher Company
Findlay, Ohio

Builders also of Buckeye Open Ditchers and Buckeye Gasoline Engines for farm use.

Good Paint Means Weather Insurance

Weather destroys more farm buildings than fire does. The sun dries the wood open and the rain soaks in. Insure against weather destruction with paint made from

Dutch Boy White Lead

mixed with pure Linseed Oil. It dries hard, fills cracks and pores; keeps out damp. Low average cost per year, economical, saves large repair cost.
Red lead—best for implements and metal—comes in paste form, same as white lead.

A Text Book on House Painting FREE

Full instructions for mixing all colors for all surfaces and weather conditions; tells the attractive and "wear-well" colors; shows how to estimate amount of paint required; also how to test paint for purity. Write for Farmers' Paint Helps No. 257 (they include the book) and save weather-wear expense.

Ruralisms

Fighting the Woolly Aphis.

I have read that lime-sulphur solution is a potent remedy for the aphis that preys upon the roots of plants, but the writer did not specify what potency would be efficient, and yet safe to use, and not kill or injure the plants. Can you tell how much water should be added to lime-sulphur of 30 deg. to meet that want? W. H. L.

Winterset, Iowa.

Lime-sulphur has been tried as a remedy for woolly aphis on the roots of fruit trees, and was found to be more detrimental than beneficial. It damaged the roots. Dr. Edith M. Patch has shown that the woolly aphis of apple trees needs the elm to spend part of its life on. It migrates from the apple to the elm in the Fall, and returns to the apple in the Spring after it has worked on the elm leaves a while, causing elm leaf-curl. See Bulletins 217 and 220 of the Maine Experiment Station. So first get rid of the elms. Trees infested with woolly aphis should be treated as follows: Spray the tops with a 10-per-cent solution of kerosene emulsion to kill such woolly aphis as are there. To clean the roots remove the soil about the trunk of small trees for a foot, large trees farther—but it is seldom a serious pest on large trees—and put a liberal supply of tobacco dust on the ground and return the soil to its place. An experimenter in Georgia has used two to seven gallons of 10% kerosene emulsion, removing the soil as described above, and returning it immediately upon applying the emulsion. A decoction of tobacco water can be used, or tobacco extracts liberally diluted will also work. The blue aphis on China Asters can be prevented by applying a liberal supply of wood ashes to the soil before putting in the Asters. And then during the season examine the roots, and if aphis are found water the soil with a strong decoction of tobacco water made by soaking tobacco stems in water. If it is on the corn you are troubled with corn root aphis—to rotate crops is the best preventive. P. T. B.

Method of Budding.

In budding trees, is the cut in the stock cut through the inner bark so that the back of the bud comes in contact with the wood, or is it just through the outer bark? I have tried the bud placed under the outer bark, but have had no success. C. C. H.

In budding two cuts are made in the stock entirely through the bark, and in the form of a T. The corners of bark made by the intersecting cuts are then slightly raised, and the lower part of the little strip of bark which carries the bud is inserted and firmly forced downward until its upper edge passes the solid bark above the horizontal cut, and its whole under surface is in close contact with the soft outer sap-carrying wood layer. If the stock is in proper condition this will be accomplished very easily and quickly but if the bark is inclined to cling to the wood it may have to be loosened carefully the entire length of the bud strip, and when in this condition the chances for success are much poorer. The whole cut should then be wound tightly with soft tying material to exclude all air and water and to hold the bud in close contact with the sapwood, the bud proper only being left uncovered. Raffia is the material used for this purpose by the nurseries. In two weeks the ties should be cut as strangulation will occur if these are left on too long. Early the next Spring the stock is cut off close above the inserted bud and after growth starts all shoots springing from buds of the stock itself should be rubbed off as soon as they start, throwing the whole strength of the stock into the adopted bud. The season for budding usually extends from the tenth of July to September fifteenth, depending on the stock to be worked and also to a certain extent upon the season. G. R. S.

THE COST OF GRAFTING.—Grafting is usually done by the piece, where there is any quantity to do, and the price charged in this locality is three cents per scion. Although the writer has done this work it has been in connection with his pruning work, and was included with it, the charge being 30 cents per hour.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

The Rural New-Yorker has, at its command, the largest and most efficient corps of correspondents and advisers ever gathered by any farm paper in the world. Thus we can obtain for you the last word on any subject relating to the soil, its cultivation or its products, or the human life of the farm. This service is yours for the asking.

*

THE article on Red-top in New York is first of a series of articles on the behavior of the popular grasses in this State. There are too many farmers who think Timothy is the only suitable grass for hay-making. Timothy is the best grass for *selling*, but in many localities Red-top or Orchard grass will give more actual feed. We shall have the facts about them.

*

ANYONE claiming to operate a mineral rod on behalf of the United States Government is an impostor and should be let severely alone, or reported to the police.

That is the way the U. S. Geological Survey gets into the game when fakers try to ride it. A "mineral expert" named Wise is working in Alabama with a mineral rod, locating minerals. He tries to make it appear that the government is back of him. Let us all get wise to Mr. Wise and the rest of the mineral fakes. The Geological Survey seems to belong to that "strong-arm squad" the Hope Farm man tells about.

*

ON April 10th, Governor Glynn signed the bill creating a State Department of Foods and Markets. No legislation in recent years has been received with favor equal to the enthusiasm created by this measure. The agricultural organizations of the State indorsed it. City societies of consumers have approved it; and individual producers and individual consumers have seen in it a promise of closer relation and mutual advantage. It has attracted the attention of economists the country over, and all have seen in it a promise of better returns for the producer and a hope of some reduction in the cost of living for the consumer. Heretofore the only answer to the farmer's complaint of low prices was the admonition to produce more at lower cost. Now for the first time in this country, we have recognized the necessity of an economic distribution of farm food products, and have actually provided the machinery for a system to distribute at prices regulated by the law of supply and demand. The institution of this department marks an epoch in the economic agricultural conditions of this State. If successfully organized and developed it will, through adoption by other States, become virtually a national institution. Governor Glynn has secured the passage of other popular legislation, but if he did nothing else his administration would be sufficiently distinguished by the creation of this important economic department in the State Government.

*

I NOTICED what your correspondent from Maine says in regard to the bills introduced in Congress to prevent the killing of calves and dealing in veal in order to increase the supply of beef. Ex-Mayor Fitzgerald of Boston, in an address before the Wholesale Beef Dealers' Association, at their meeting in Boston, was reported as advocating a law to compel every farmer to raise at least one beef animal for every two acres of land that he owned. It seems to me it would be more sensible to limit the size of the beefsteak that these gentlemen eat at their breakfast table if they are so anxious to increase the supply and reduce the cost of beef.

Massachusetts. W. E. T.

As a rule, the anxiety of these gentlemen to benefit humanity stops when their own interest ends, or when their own self-denial would begin. A man's public argument rarely runs along with his private practice. These orators would willingly compel farmers to produce beef at a loss in order to lower the price of their own beefsteak. If we were to call for a law compelling them to eat baked beans and fish balls, so that the market price of beef would be cheaper, there would be a frightful howl. Yet most of these gentlemen would be better off for the bean and fish diet, while such a law would be just as sensible as and more useful than the one they advocate.

*

THUS far at least 50 persons have come asking what they can do to abate the tramp hen nuisance. These people have gardens in which they take great pride. The neighbors have hens in which they take no pride, but let them forage at will. These tramp birds, cursed with the indolence, cupidity or meanness of their owners, come into the garden and tear it apart. The trouble lies in the man behind the hen. What can we do with him to make him recognize ordinary human rights? Thousands of our readers will look at their ruined plants and regret that they have too much character and too little size to take this hen man out into the road and thrash him. Failing in that vent for their feelings, what can they do? They can shoot the hens after fair warning and then stand the legal consequences of carrying a dangerous weapon and destroying property. They can be held liable for the value of the hens. They can keep a smart, active dog and train him to chase these hens whenever they come upon the premises. The best thing we know of is to entice the hens into a house and keep them until the owner does his duty. The hens will more than pay for their food, while the hen man is getting wise. There is no meaner little annoyance than this one of the tramp hen. He who can endure it with patience is a good candidate for the job of Job.

*

WE have never known the time when so many wealthy men in the city were interested in what they call "the cause of the farmer." These gentlemen profess to be sincerely anxious to help the plain man on the farm, and they ask what they can do to be of real service to him. We do not need to tell them that before one can be of real service to another it is necessary to understand not only his condition, but his point of view, and the way he looks at life from his home. It stands to reason that one man cannot hope really to help another and give him permanent aid until he can understand just how his friend lives, how he works, and the conditions under which his life is passed. Therefore it will be clear to our city friends that they can do the farmer far more good if they understand just his point of view and the difficulties under which he works. Naturally a man cannot live and work out his life in a great city, and still understand just what it means to work through sunshine and through storm upon a mortgaged farm. A practical friend has made the following suggestion to us. It may not appeal directly to the gentlemen who are anxious to help their farmer friends, but we give it for what it is worth.

This man suggests that a good way to get at farming from the inside would be for some of these philanthropists to disguise themselves as hired men, and join one of the excursions of city laborers up into the country where farmers come and size up the workmen with purely an eye to business. It might certainly give some of our benevolent friends a new idea of the needs of agriculture, and its dignity as well, if they were to present themselves in this disguise, let the practical farmers view them with an unprejudiced eye, and size up their value exactly as they think they would be able to render practical services upon the farm. We should not object at all to listening to some of our friends in their discussion of the farm problem, and then let them hire out in this way as farm hands, and spend one month upon a practical dairy farm of an average type. It would afford us great pleasure again to listen to their remarks on the needs of the farmer when they return from this very practical experience in actual farm life.

*

"THE use or introduction for drinking purposes of alcoholic liquors on board any naval vessel or within any yard or station is strictly prohibited and commanding officers will be held directly responsible for the enforcement of this order."

That is the text of an order issued by Secretary of the Navy Josephus Daniels. That means absolute prohibition of the use or introduction of alcoholic liquor upon any vessel of the United States Navy or within any navy yard or shore station. If you would realize the full meaning of this go back into history for a century. On August 13, 1813, the American brig Argus, cruising in the English Channel, captured and destroyed a ship laden with wine. Guided by the light from this burning ship the English brig Pelican came upon the Argus. The crew of the latter were noted for their expert gunnery, but in this battle they could not hit the side of a barn. They were drunk on the wine they had captured, and the Argus was pounded into a wreck and captured! There is no more need of rum in the navy than there is on the locomotive or at the railroad switch. For years now the sailors in our navy have been punished severely if found drunk or caught bringing liquor on board. The officers, however, have been able to drink as they pleased, and some of them seem to have been "soaked" much of the time. What Secretary Daniels has done is to make one rule for both officers and enlisted men, and he is right—outside of any moral consideration of the matter. There can be no question of the fact that year by year public sentiment against liquor-drinking grows stronger and stronger. It is now only a question of time when rumseller and the "rum-punisher" will be regarded by respectable people as criminals or men afflicted with a moral disease. Our warships do not belong to naval officers—they belong to the people!

*

THE efforts to give the American farmer a real parcel post have brought out a storm of ridicule from a class of people who habitually sneer at any effort to bring producer and consumer closer together. The Postoffice Department is trying to help city consumers find farmers who will ship farm produce direct by parcel post. A good sample of the efforts made to ridicule such a plan is a letter from Benjamin S. Dean, printed in the New York Sun. Here is one extract; we will take another later:

> Just imagine a Chautauqua County farmer wading through three feet of snow to feed the chickens and to milk the cows and doing up dainty parcels of produce for his brother man in New York city and giving this brother man the advantage of the reduction in the cost of transportation and the elimination of the middleman! Imagine it, I say, for you will never find him doing it.

The trouble with Mr. Dean is that he either has no imagination or doesn't know what he is talking about—probably both. Chautauqua County farmers are as intelligent as any others. When snow comes they must wade through it anyway. Mr. Dean wants them to continue wading for a 35-cent dollar. They will never get any larger share until they go after it, and parcel post shows them the way. "You will never find him doing it." That is where you make your mistake. We know a regiment of farmers who are selling sausage, lettuce, maple products, poultry, vegetables, meat and a dozen other things direct by parcel post. One man has sold over 25 pigs as bacon and sausage, by mail and netted over $6 per pig more than if he had sold to local butchers. Right over the line from Chautauqua County a farmer was discouraged because dealers would pay him only 65 cents a gallon for maple syrup. A single little notice in THE R. N.-Y. has already brought calls for over 50 gallons at one dollar. We can give hundreds of instances where farmers and their wives have developed direct trade, and more than doubled the 35-cent dollar by using parcel post. Such men as Benjamin S. Dean may sit on the fence and sneer and ridicule. They may even discourage a few faint-hearted people, but when it comes to holding up a useful reform of transportation they are just about as useful to society as a kernel of grit dropped inside the hub of a wheel!

BREVITIES.

IF you are thinking of letting the trees go without spraying or trusting to parasites—forget it and spray.

REPORTS show a great shortage of tomato plants in many trucking localities This is due to hot-house failures.

IN all this talk about how to keep the boy on the farm, why has not some one thought to *ask the boy?* He is the interested party—why not get his views?

MUCH time is lost in spraying waiting for the tank to be filled. Where a power sprayer is used a "tank filler" is a great time-saver, for the power will quickly pump the tank full.

RECENTLY a correspondent told of planting several kinds of peas together—mixing the seed so as to have a long-continued crop. Have any readers reports to give regarding this?

WHEN it comes to double-cropping a garden, you must remember that you cannot reasonably expect to make both crops produce full yields. For example, sweet corn growing among potatoes. You can only expect a fair crop from each.

A PIECE of New York property having a frontage of 27.6 feet on Broadway, and 94.11 feet on 20th St. was bought in 1842 for $3,000. The present assessed value of the land is $252,000. It was recently sold, after belonging to the same family for 72 years.

CO-OPERATION FOR MILK PRODUCERS.

Fair Profits to the Workers.

A NEW OPPORTUNITY.—Milk producers should find the solution of their problem through the new State Department of Foods and Markets. The opportunity for them to organize coöperative companies, and utilize the services of the market commissioner for the selling of their goods, is open to them as well as to other producers of the State. In every neighborhood where the Dairymen's League has members, it will be a simple matter to get the members together and coöperate under the coöperative law. Even where the League has no members there would be no delay in forming a company. The State has made an appropriation of $20,000 for coöperative organization work this year, and milk producers may as well get busy and get the benefit of the share of the service that rightly belongs to them. The work has already begun. Coöperative associations have already been formed in some sections. The purpose of the coöperative company of milk producers is to market the milk, and if necessary to care for it in one bulk by the company, instead of individually as it is usually done now.

EXCLUSIVE SALE.—Membership must include the condition that the milk produced shall be sold through the company, and this should be made a part of the by-laws or other form of contract. This is essential. Failure to provide for the sale of products exclusively through the company has been responsible for most of the discouragements in coöperation both in this country and in Europe. Beginners are always anxious to leave a loophole. They are perfectly willing to sign a contract with a New York milkman for six months or a year, and often without knowing much of anything about the responsibility of the buyer; but when it comes to their own company, where there is no question about its credit, they want to reserve the privilege of selling elsewhere. With the New York concern they readily sign a definite contract all in favor of the buyer. With their own company, they refuse a contract that binds them to anything. The result is that those who refuse to sell exclusively, through their own company, get the benefit of the association when milk is flush; but as soon as there is a scarcity, the dealer offers a fraction of a cent more, and these privileged members then abandon their own company, and weaken the organization. It is far better not to have such members at all. Coöperative companies must be run on business principles. Coöperative companies failed at first in Denmark, for just this reason. But no such mistakes are made there now. Every member pledges his milk to the association. The companies are universally successful, and Denmark is noted for the success of its coöperative dairy industry. Originally the Danish dairymen mistrusted one another and coöperative companies, just as dairymen did at first in Ireland, and as they heretofore have mistrusted in New York. The failures in Europe due to the causes referred to above, discredited coöperative work, and discouraged dairymen in Europe just as they have done with us. But just as soon as they organized right they were successful. Just as soon as we organize right, we shall be successful also. We now have the law, and the proper forms, and the State is willing and anxious to furnish the organizers, and start the coöperative enterprises.

WASTEFUL METHODS.—The method of distributing milk in small cities and towns by the individual farmers who produce it is extravagant and obsolete. As now practiced it is a slavish work, and the profits by no means compare with the labor and expense. The present methods require duplication of equipment of distribution by each producer in the business. Each distributor has a certain amount of dairy surplus which with him figures largely as waste. At times his supply falls short of the needs of his customers; and as a rule the whole territory within the distributing center will be covered by each of the competing wagons. With a coöperative dairy company in the neighborhood, all of the milk of all the producers would be delivered to the creamery or station, and then cooled, and prepared for distribution in bottles or otherwise. The distributing territory would be laid out in districts, and one equipment provided for distribution in each district. There would be no two wagons covering the same territory. The capital and labor required for distribution would be much less than now and the cost of distribution proportionately reduced. There would always be supply enough to fill the demand, and there would be no waste, because the surplus would go in with the regular deliveries to be manufactured or shipped to other markets. An important trade in butter, simple forms of cheese, and especially in ice cream could be developed from the creamery. Milk and cream are shipped from many up-State towns to New York, and a foreign concoction of skim-milk and cornstarch pudding returned to the town under the label of ice cream. When the ice cream is supplied in the town it is seldom made and controlled by the producers. There is every reason why the producer should have the benefit of this trade. By producing a high grade of ice cream, and advertising it, a large and profitable trade could be developed in every city and town in the State.

ELIMINATING WASTE.—Practically every business has side lines, specialties and waste products to dispose of. In many lines the profits come largely out of waste products. The farmer must get into the way of saving these wastes, and of preserving for himself the profits of incidental products, such as ice cream and cream cheese. Heretofore he has not been able to do so, because individually he could not afford to develop these incidental features of his business; but the coöperative factory can handle the goods and develop the trade and turn a neglected trade and a waste of material into a good business and a liberal profit.

DEALERS AND PRODUCERS.—During the last 30 years about a dozen milk dealers in New York City have set the price that consumers must pay for milk, and at the same time dictated the price that the producer of milk must accept for his product. The dealers have managed this because they have been closely organized and act as one person. Producers and consumers have been unorganized and each deals with the milk dealer as an individual. The family that cannot afford to buy milk on the dealer's terms has the privilege of going without it. The farmer who gets tired of producing milk at a loss, may sell his cows and go out of the business. There has been no alternative.

FORMING AN ORGANIZATION.—Now let us change the situation a bit. Let dairymen in every section organize a coöperative company. Let the members pledge the milk to their own company on the coöperative basis. Put the sale of the milk in the hands of a committee of their own members. If this committee can sell the milk at fair prices to establish creameries or shipping stations in their own neighborhood, well and good. The committee can demand good credit at good security, and prompt pay. If it cannot be sold locally, then provision can be made to ship or to manufacture it in a coöperative creamery at home. The individual dairyman would have no troubles. The committee and its salesman would have the business part of the company to look after. There are sections where a company of this kind cannot be operated without a struggle. The organized forces will put every possible obstacle in their way. They had this kind of opposition in Europe too. The fruit men had it in California, and the wheat growers are having it now in Minnesota and Dakota. But where producers organize properly and pledge the product to their own company, they always succeed against the impotent opposition of middlemen. The only way the middlemen ever succeed in opposition is by dividing the producers against each other. Let every member pledge all his milk to his own company, and after one year's trial, no producer would go back to the old and ruinous method of selling milk individually.

SAVINGS BOTH WAYS.—The organization that will receive the milk, and prepare it for distribution and sell it will also be in a position to buy for the dairyman many of his supplies at wholesale prices. Feed, fertilizers, hay, flour, salt and numerous other supplies can be bought in bulk at a great saving over local retail prices, and as this system is developed much of the trade would be direct between one farmers' coöperative company and another. The dairymen of the East should be able to buy their grain from the coöperative grain elevators of the West. The surplus products of one section could be easily marketed through the coöperative company in sections where such products do not thrive. In such cases the producers would sell direct to consumers through their respective associations, and both would be benefited. The only expense would be the necessary cost of transportation and distribution on the most economical basis. In discussing the possibilities of a trade of this kind it is necessary to remember that under the present system 65 cents of the consumer's dollar goes to the distributor. If we increase the producer's share by only 10 per cent. of the consumer's price, the dairymen of New York State would realize about $60,000,000 more than they do under present methods; and the farmers of the State all told would realize $200,000,000 more than they get now.

FARMERS AS PRODUCERS OF WEALTH.—Let farmers always remember this: Coöperation is not merely a system of buying or selling. It involves a great big fundamental principle of the distribution of wealth. Farmers are the greatest producers of wealth in the country or in the world; consequently they should be the wealthiest class in the country, or in the world. It requires no argument to prove that they are nothing of the kind. Why are they not in possession of the portion of wealth they create? Every man who creates wealth, or produces, must be supported. This support represents principally the cost of production. But most workers produce more than enough for support. This extra portion is called surplus. Of course, it rightly belongs to the man who created it, but in our complex system of production and distribution a few men manage to control the tools of production or the agencies of distribution, and through these agencies these few men manage to appropriate all the surpluses to their own use. The surplus of each individual producer may be small, but many such surpluses controlled by one man makes him rich. It is this accumulation of surpluses in one hand that makes the colossal fortune. If the surplus of all milk values were left in the hands of the dairymen who produce the milk, there could be no millionaire milk companies. The fortunes they make would simply be distributed among the producers. It would not make millionaries of any of them, but it will make them all more prosperous.

ECONOMIC PARASITES.—In so far as the distributor, the agent or the middleman renders a necessary service, he exercises an economic function in production, and is entitled to reward in proportion to his service. But the speculator, the manipulator and monopolist in food products render no legitimate service to anyone. They are, as far as producer and consumer are concerned, economic misfortunes. They are to distribution what frosts and droughts and insect pests are to production. We are not permitted to spray them with lime and sulphur, but just as we labor to keep rank weeds out of the vegetable garden, so must we work to keep useless middlemen out of the distribution of food products.

CO-OPERATIVE EFFORTS.—This is what coöperation is intended to accomplish. It is to preserve the surplus of production for the man who produces it. To accomplish this we must put the tools of production and the agencies that control distribution in the hands of the producers. Farmers control the tools, and we need in their case only to put the agencies that control distribution into their hands. It is not necessary in all cases for the producer to follow his product all the way to the consumer's table; nor would it be wise for the farmer to exact an excessive price. The State Department of Markets will aim to establish prices through the law of supply and demand. Surplus products will work off quickly at low prices. Short supplies will demand better returns. The purpose of the department is to keep the channel open for the flow of food from the farms to the city homes. The system cannot be established in a day or in a year; but if farmers lend themselves to the coöperative system, within ten years the farms of New York State will increase from 50 to 100 per cent. in value, and we will have in New York State the most favored and the most prosperous farmers in the world. J. J. D.

New York State News.

DISPOSAL OF DISEASED COWS.—When the New York Milk Committee made the statement that the Department of Agriculture was giving away tuberculous cattle to be killed and fed to the inmates of State institutions, they evidently did not have full information on the subject. Deputy Commissioner of Agriculture Harry B. Winters, in the absence of Commissioner Huson, denied the charges made by the New York Milk Committee. He says the department does not give away cows, and such cows as are killed are killed under the direction of a State veterinarian, and if the veterinarian finds the meat wholesome it is sold. If the meat is diseased it is destroyed with acids and buried. "In every instance," Deputy Winters is reported to have said, "a State veterinarian is in attendance at a killing." Under the segregation contract the institution, or the farmer who has charge of the cattle, has the right to use the milk after pasteurization but is enjoined from killing the cattle.

GETTING FARM HELP.—The manager of the Jefferson County Farm Bureau called a meeting of farmers who want help, for April 8, at the manager's office. All farmers who are willing to take such help as may be secured in coöperation with the agents of the Department of Agriculture and give them a fair trial, will meet and select one of their number, or some other representative, to go to New York and in conjunction with the Department agent make a first hand selection of laborers to suit the needs of the farmers. Each farmer makes out an application for the class of help wanted with the understanding that the laborer's transportation will be paid, the amount to be deducted from his earnings after being employed. This is an intelligent way of going after farm help, better for both farmer and laborer than to set a carload of men down at a station without any definite arrangement or undestanding as to where they shall go, or of what kind of work they will be required to perform.

NEW STATISTICIAN.—Dr. Cressy L. Wilbur, chief statistician of the U. S. Census Bureau, has been assigned by Director Harris to take charge of the new division of vital statistics in the State Department of Health, now being organized. The salary of the position is $4,000 a year. Prior to his connection with the census department, Dr. Wilbur was chief of the division of vital statistics of the State of Michigan.

NEW GRANGES.—The official report of the secretary of the National Grange just received shows that during the first three months of this year there were 12 new Granges organized in this State. The total of new Granges in the United States for that period was 220 and 11 reorganized. Ohio and Nebraska are tie for first place with 29 new Granges, followed by Kansas with 26.

GRAIN ELEVATOR RATE BILL.—Gov. Glynn has vetoed the grain elevator rate bill amending the law relative to the rate to be charged for elevating grain. The Governor says, in brief, that the present law provides that the maximum charge in any city not exceeding 130,000 population shall not be more than five-eighths of a cent per bushel. The amendment would insert after the word a "maximum charge," the words "to be made or fixed by any person, copartnership, or corporation, or association of persons, copartnerships, and corporations or any of them." The governor objected to the term "association of persons" whose effect might be to give legal stand to a possible combination which would otherwise violate the anti-trust laws of the State. The governor has signed the bill increasing the salary of the Commissioner of Agriculture from $6,000 to $8,000.

RURAL SCHOOL GARDENS.—Trophies in the form of cash prizes of $60, $30 and $15 are to be awarded by the State Fair Commission for rural school garden displays. A representative of the Education Department and one from Cornell will be in charge of the exhibits.

GOOD PRICES FOR COWS.—Up in the northern part of the State, according to reports, the demand for dairy cows is strong and the prices are more than good. It is believed that the market will advance rather than recede. One farmer and breeder sold five calves and a yearling for $825, and the purchaser left a standing order for what heifer calves there might be for sale, at $75 each when four or five days old. On another farm five calves but a few days old, brought $88 each. These cattle were mostly Holsteins. The increase in price on purebred stock has had its influence with grade cattle and these occasionally reach the $100 mark. J. W. D.

Woman and the Home

From Day to Day

THE ROBIN.

In the tall elm tree sat the robin bright,
Through the rainy April day,
And he caroled clear with a pure delight
In the face of the sky so gray,
And the silver rain through the blossoms dropped,
And fell on the robin's coat,
And his brave red breast, but he never stopped
Piping his cheerful note.

For, oh, the fields were green and glad,
And the blissful life that stirred
In the earth's wide breast was full and warm
In the heart of the little bird.
The rain-cloud lifted, the sunset light
Streamed wide over valley and hill;
As the plains of heaven the land grew bright
And the warm south wind was still.

Then loud and clear called the happy bird,
And rapturously he sang,
Till wood and meadow and riverside
With jubilant echoes rang.
But the sun dropped down in the great west,
And he hushed his song at last;
All nature softly sank to rest,
And the April day had passed.

—Celia Thaxter.

*

HERE is a puzzling question that is offered to readers. A correspondent in New York State asks:

Can you tell me where I can get what were known years ago as "California Bees"? They resembled small pieces of dough, which upon being placed in a can of sweetened water started working or fermenting. They would sink to the bottom, bubbles would gather on them, they would rise to the surface, discharge the bubbles, then sink and repeat the process. This liquid after a time would sour and was used as a substitute for vinegar in pickling.

These "California Bees," of course, started a ferment in the sweetened water. Ordinary yeast could be used in similar fashion.

*

ANY woman who is interested in home millinery should be sure to add milliners' pliers to her outfit. It is surprisingly easy to bend a wire just right with the handy little pliers, whether for stiffening a bow, edging a brim or supporting a ruche. When stiffening an upstanding halo of maline to trim the crown of a hat, it is a good plan to bend the wire into a series of square-cornered battlements, like the "walls of Troy" pattern, each battlement about three inches wide, and as high as the trimming requires. The wire can then be brought a little closer together at bottom than top, so as to give a slight flare. It can be fitted better than where there is a separate top and bottom wire, joined by upright pieces and is simple to make with the milliners' pliers.

*

THE notion counter of a big department store is very instructive in the novelties it displays, which always reflect changes in fashion. In the days when every woman wore a high tight stock collar, boned to the last degree of endurance, collar foundations were prominently displayed, but they are now placed in the background. Collar supports of various inconspicuous kinds are plentiful, because transparent guimpes require them, but the newer neck trimmings are cut low in front, with some sort of stand-up collar at the back, which calls for invisible wiring. Ruche supports for the Medici pleatings are of fine wire, while for the flaring Gladstone collars one can buy fine wire by the spool; this is run along the hem of the collar. Among the newer fastenings, in additional to several new ideas in hooks, there are snap fasteners already attached to tape, which may be bought by the yard. If we wish to use pipings or covered cording for dress trimming, the notion counter offers cable cord, in several sizes, which may be bought by the yard or by the pound. It is soft and flexible, and when covered with silk it is used in both millinery and dress trimmings. Among minor conveniences at the notion counter are the skirt gauges, for measuring the length when hanging a skirt; they cost from 25 cents up. We have often noticed what a scant array of dressmaking conveniences some women possess, in spite of doing all the family sewing, and how much effort they have to waste, for the lack of some trifling aid. It is not only the lack of great conveniences such as running water, or adequate heating, that impair efficiency and add to labor, but also the small things that make work "handy," and thus reduce effort.

The Rural Patterns.

When ordering patterns always give number of pattern and measurement desired.

8158 Child's dress, 6 to 10 years. With square or round neck, long or short sleeves, with or without bloomers. 8090 Girl's dress, 10 to 14 years. With long or short sleeves. 8148 Girl's dress, 8 to

14 years. With straight skirt that can be plaited or gathered, blouse that can be left loose or cut off and drawn up at the waist line, with low or high shield, long or three-quarter sleeves, sailor or square collar. 3138 Boy's overalls, 4 to 8 years. 8159 Boy's Russian suit, 4 to 8 years. With square or sailor collar, long or short sleeves, high or low shield.

8172 Coat in kimono style, 34 to 40 bust. 8197 Eton coat with vestee, 34 to 42 bust. 7985 Semi-princesse dress for misses and small women, 16 and 18 years.

8191 Draped two-piece skirt for misses and small women, 16 and 18 years. 8123 Three-piece skirt, 22 to 32 waist. Price of each pattern 10 cents.

Diet for Diabetics.

Having in the family a diabetic patient, the subject of cooking minus the starch and sugar elements comes home to me. In general, doctors agree on fundamentals, but on certain points they differ. Oatmeal and all oat products are taboo by the average physician, but our family doctor feeds rolled oats in every imaginable form—gruel, porridge, bread. He cured a bad and chronic case while feeding the patient every day oatmeal in some guise. Again, doctors in general forbid tea and coffee, while some hospitals allow both. The printed list of edibles permits milk only after being peptonized, while some doctors give it raw or cooked in every possible way; others think it matters not how it is served, while still another class advise trying it each way and deciding which method suits the individual case. It is safest to gain the family doctor's opinion in every instance, then adhere to his advice, pinning perfect faith to his precepts. Diet is the strong factor in this trouble, usually only a tonic being added

If oatmeal is forbidden, then one is narrowed to gluten for bread, and one's ingenuity is taxed to vary its forms. When made with milk, and served hot the buns are delicious, but the cold raised yeast-bread is rather lean. When cut in slices it is made more palatable if chopped nuts are added. Make a sponge of the flour scalded with hot milk (new and sweet), and a cup or cake of yeast added after sponge cools somewhat. After this is light, mix like any raised bread with more flour and warm milk. If one hasn't the milk, use warm water and a little lard or butter. The biscuits made of sweet milk and baking powder, with salt, and shortening, may be mixed hard and cut out like biscuits, or dropped into gem pans with a spoon. Stirred up with buttermilk and soda, adding a well-beaten egg, improves their flavor. Nut meats may be added, likewise, to the rolls. Cakes of all kinds may be made by using saccharin, no sugar.

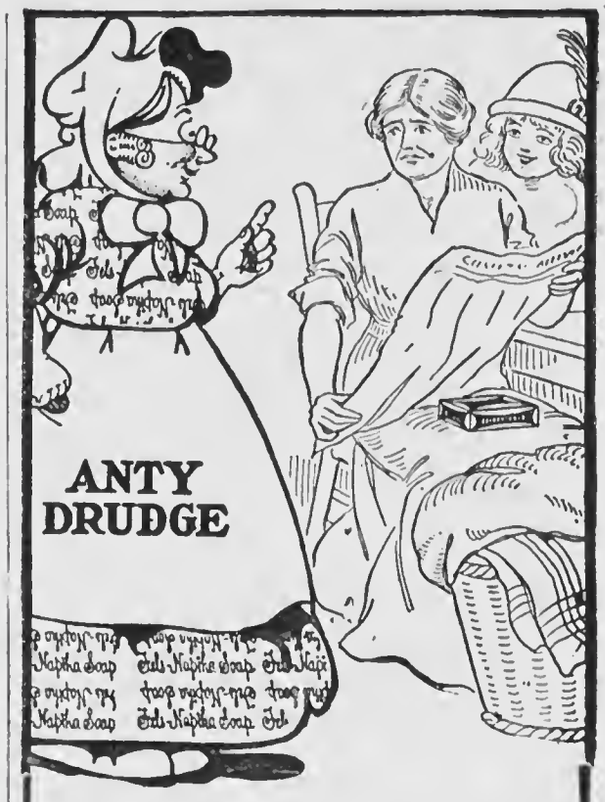
Some hospitals forbid cocoa or chocolate, while others do not. Almond bread or cakes, made of one part almond flour and one part gluten, are allowable and a welcome change, as are bran muffins, made one part bran to three parts gluten flour. Meats of all kinds are permitted, but if the gravies are to be thickened, it must be done with one of these three flours, as wheaten flour is banished altogether. Our physician said that white raised, sliced bread, toasted through and through, is less injurious than white flour in any form, although it is not to be served even thus.

Lemons, sour apples and sour oranges are given, and as sauce is almost imperative in so narrow a bill of fare, it behooves the patient to serve apples in a different way every time. They may be baked without flavoring, stewed, canned or preserved with either the orange or lemon juice and grated rind to give piquancy, or better still, may be peeled, cored, and sliced, covered with water, and cooked in the oven till a dark red. Sweetening in all instances is confined to saccharin, which is not so expensive when one becomes accustomed to the need of so small an amount. With practice one becomes expert in its use, even manufacturing pies and puddings, and using gluten for the crust. As eggs and milk may be taken indiscriminately, lemon, orange, cream, and custard pies are within easy reach. Even crackers may be made of pie crust and kept indefinitely for soups, stews, and chowders.

As the vegetable list is so limited, it is wise to can a fresh supply for Winter use, for the general health calls for this help, and the wide array of fish and meats (all but liver) is more palatable so supplemented. Greens galore are advised, dandelions, cresses, radishes, celery, oyster plant, asparagus, mushrooms, tomatoes, onions, cucumbers, lettuce, kale, chickory, beet-tops, spinach, string beans, olives, and all of these taken as green vegetables, or pickled. Oil and vinegar come in handy with many of these. The patient whose one standby in the vegetable line has been the trusty potato will be challenged for some vegetable to take its place.

Walnuts, almonds, filberts, pecans, Brazil nuts, and cocoanuts may be eaten and these chopped make good in sauces and cakes where fruit would be utilized. Peanuts and chestnuts are taboo. Shellfish, indeed, fish of all kinds in every imaginable form are allowable. Diabetes is a middle-age disease; the old and the young being seldom attacked by it, and frequently runs on for years, kept in check and often cured by careful dieting with seldom a fatality.

L. L. TROTT.



Mrs. Shiftless—"I'm ashamed to have you catch me reading when I ought to be washing my blankets. But I sent Mary to the village for some soap that wouldn't shrink wool, and the storekeeper wrapped it up in this newspaper that has such an interesting story in it. I just couldn't resist a look at it for a minute."

Anty Drudge—"Well, the storekeeper knew his business. He sent you Fels-Naptha Soap. Now if you'll spare me a few minutes I'll show you how to use it in lukewarm water. You can get through in no time, and then you can finish your story with an easy mind. Fels-Naptha is grand for all kinds of woolens, it makes them as soft and downy as when new."

Fels-Naptha will get your clothes on the line in a couple of hours after breakfast, and you can start ironing Monday afternoon, feeling rested and refreshed. That will make your Tuesday's work easier, too.

Fels-Naptha Soap works best in lukewarm water, and little rubbing is necessary. Your blankets will be soft and white.

Buy Fels-Naptha by the box or carton. The easy directions on the Red and Green Wrapper should be followed.

Fels & Co., Philadelphia.

FELS-NAPTHA

Art in Rags.

The old-fashioned women made carpet-rag rugs from motives of economy, considering them only as makeshifts, and, indeed, they could hardly have been mistaken for anything else. Modern women make them, some because "cottage rugs" are the fad at present; others because they admire the soft colorings and crisp daintiness of floor coverings that may go to the laundry as often as the bed linen and come forth as unspoiled. The latter sorts of women demand art before economy, usually buying the colors they require and tearing up new cloth to be woven into rugs; while the economical woman throws her old rags into some sort of apology for a rug and sits down to endure it.

Now, why may not each sort of woman have what she desires, even though art, economy and popularity joined issues? Certainly with the accumulation of half-worn garments in every home there can be no excuse for purchasing material to tear into strips, especially as repeated washings have lent to the old goods a softness of coloring that is ever essential to art in any form. Equally unreasonable is it for the woman to whom economy is a necessity to endure crudely colored floor coverings, for even though made of rags the rugs may be in soft, harmonious shades and designs, suitable for any room in the house.

For the room whose color-scheme is brown, let me suggest a rug in brown shading to white. The centre may be of mottled brown and white, with an inch-wide border of pure white marking the beginning of the outer border of plain, clear brown in a darker shade. For a bedroom a rug of lavender and gray made after the same style, with perhaps a final narrow border of black. Or another in shaded blacks and steel grays. Which, think you, would appeal first to the eye of the beholder—the economy or the artistic beauty of the floor coverings?

Then to whichever class of women you belong, if you are about to evolve rugs begin by carefully sorting the crude materials, both as to color and fabric. Keep black and colored hosiery separate, there being nothing better for borders, the black in stockings being particularly soft and pliable. There is seldom too much white, as when not wanted in the natural this can so easily be dyed to help along any preferred color scheme.

A favorite method of dyeing produces a shaded effect. Sew and tie the rags into skeins loosely. Then wind wide strips of cloth around the skeins very tightly, tying three or four inches apart. When dyed the places where the skein was tied will have absorbed little or none of the dye, while the untied portion will show the full depth of color, producing when woven, a shaded or mottled effect that is very pleasing. A similar effect is produced by cutting striped bed-ticking *across the stripe*; one bed-tick producing sufficient material to make the body of a small rug. There should be a narrow border of white, with a wider border of blue of the same shade.

The cutting and sewing of the rags need not be the irksome task it is usually considered. If you are so fortunate as to have friends engaged in the same task why not have a carpet-rag "bee," and make a jollification of it? Or little fingers may be brought into requisition, and much fun be gotten out of what will be indeed a great assistance. Even the sewing machine may be brought into service in the sewing. Tear sheets, pillow slips, etc., into large pieces having straight edges. Then lap one edge over the other, allowing the left-hand edge to project about three-eighths inches beyond the righthand edge; stitch across the ends twice, making a flat seam. There will be no loose edges if you stitch close to each edge. This will give you a tube of cloth which may be cut in one continuous strip, by beginning at the projecting edge and tearing round and round, cutting where sewed. Stockings also may be cut in one continuous piece from the hem to the toe. Begin with a gore-shaped piece, the narrow tip to be discarded, trimming the second row to proper width, and cutting round and round, as one peels an apple.

Carpet-rags should average about three-quarters of an inch in width, which statement should be taken mixed with judgment. Very thin or sleazy materials, such as stockings, a strip of which will stretch out into an infinitesimal thinness, should be cut wider; heavy materials such as flannels, etc., should be much narrower. To determine the proper thickness take a section of each material and twist it between the fingers, putting them side by side, which will enable one to determine about how the thickness will average when pounded together in a rug. It is really better, however, not to mix materials in the same rug, using the cotton rags by themselves, and the woolens and knit goods together.

Allow about 1½ pounds of three-quarter-inch rags for every yard of rug or carpet desired. That means the square yard, as most rag carpet is woven a yard wide. However, delicate-colored rugs which must go often to the laundry, are best made narrower, 2½x4½ feet being a good size. Darker rugs may be any size desired.

Room-size rugs are best woven in strips and sewed together, (for a six-by-nine rug two yard-wide strips woven nine feet long) having a border woven across the ends only, and either with or without a fringe of the carpet-warp.

Beside having them woven there are several ways of making carpet-rag rugs. By braiding the strands and sewing the braid together; by crocheting in strips with a large wooden hook, or by weaving on a hand-loom. A hand-loom may be made from a large board into the ends of which are driven nails about an inch apart and directly opposite each other. Carpet warp or heavy cord is strung back and forth over the board from nail to nail, then the rags are woven into this warp, over one thread and under the next, exactly as though darning a hole in the stocking. Either method makes very good rugs, but for general wear the more satisfactory method is to put the prepared rags in the hands of a competent weaver, who will submit designs and suggest colorings if desired.

MAUDE E. S. HYMERS.

Boiled Apples.

As to baking apples, it is one of the fine arts of the cook to have them right, and all Yankees were trained to its creed. But some are not situated to bake; for them, boiling can be used. When we were in the city cooking with gas stove we found this out and taught it to many friends. Put on clean apples, whole, as if to bake, with little water and sugar to taste. Simmer slowly till soft, take out apples, boil juice down to syrup and pour over. These will hardly be known from baked. E. D.

Raised Doughnuts.

How do you make the old-fashioned raised doughnut of our grandmothers; light, tender and toothsome as it was? How can the cook fry them so as not to soak fat, just how much shortening and sweetening? E. D.

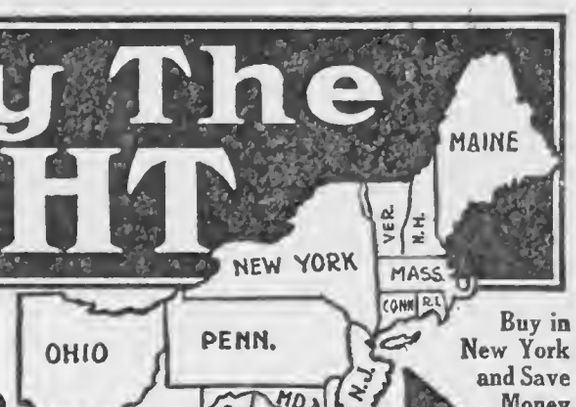
Old-fashioned raised doughnuts are made as follows: One pint risen milk bread dough; one cup sugar; two eggs; one tablespoonful melted butter; spice to taste; flour enough to roll out. Put the bread dough into a bowl, and work the other ingredients into it, the flour last. Roll out, cut and fry in deep fat. To prevent the doughnuts from soaking fat, the fat should be boiling briskly when they are dropped in and only a few put in at a time, so as not to cool the fat too much. As they are cooked, the doughnuts should be laid on paper to drain.

Cheese Cake.

Will you give a recipe for cheese cake, same as we buy in bakeries? A. K.

The following recipe is, we think, richer than the bakery article, the proportion of egg being higher, but the general composition is the same. We sometimes use less egg, when it is convenient to do so: One and one-half cup cottage cheese, two tablespoonfuls cream, one-half cup sugar, three eggs, juice and grated rind of one lemon (or, if preferred, one teaspoonful vanilla); one teaspoonful melted butter. Press the curd through a colander, add the eggs, well beaten, then the other ingredients, and beat all till smooth. Line a deep pie dish with paste, fill with this mixture, and bake 30 minutes. If desired some currants may be added. Little tarts, baked in pattypans are nice, filled with this mixture.

We Pay The FREIGHT



Buy in New York and Save Money

To Any State Shown on This Map

and part of the freight to all States beyond. Think of what it will mean to know to a penny **before you order** just what the goods will cost you laid down in your own town. Think of the money you can save in having

Nothing to Pay When the Goods Arrive.

If you live in one of the States shown on the map, we pay the freight on all shipments of 100 lbs. or more (excepting only vehicles and farm implements). You can get everything else delivered free. For example: Household Furniture, Sewing Machines, Stoves, Harness, Wall Paper, Paints, Roofing, Fencing, Incubators, Cream Separators, Hay Tools, Gasoline Engines, Dry Goods, Millinery, Clothing and Shoes for all the family. If you live anywhere outside the States named above, we will pay all delivery charges on Dry Goods, Wearing Apparel, Millinery, Shoes and Jewelry, and a liberal part of the freight charges on everything else excepting vehicles and farm implements. So no matter where you live you can enjoy this new Freight Paid advantage in part, if not all. No other big mail order house offers to pay the freight on almost everything for home, farm and shop.

GENTLEMEN:

I have to acknowledge the receipt of the full set of Three Kitchen Knives, when I only sent for one—the No. 1 small Carver—and am really entitled to only one (sent as a reward for subscription work). You certainly do all you promise and then some. The knives are certainly good ones, so good that I want more of one kind. Can you get for me five more of the No. 1, "Small Carver"—the pointed blade, hand forged? That little knife is one of the slickest Asparagus cutters I have seen yet, and that is what I want them for.

Thanking you for the blades, I am,

Very truly yours,

S. E. FRISBIE,
Milford, Conn.

Every article sent for securing subscriptions will give equal satisfaction. A post card will bring you the Reward List.

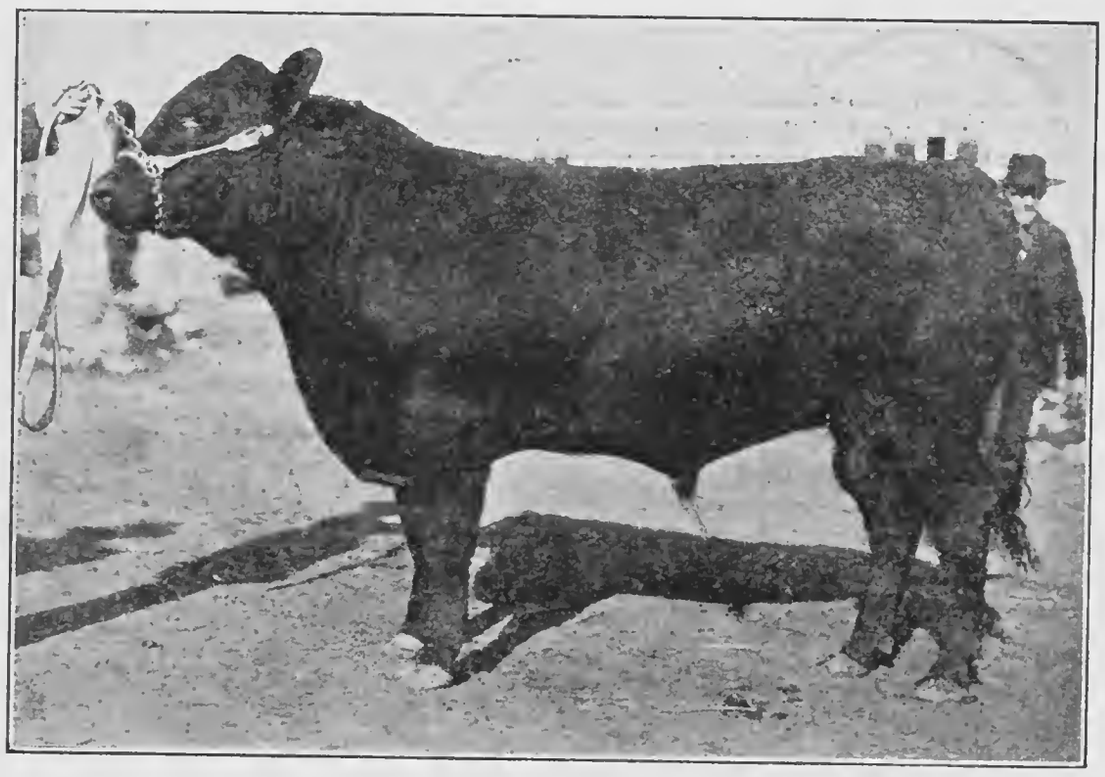
TESTING A COW AND WHY.

[Since we printed the picture of that big-bagged Holstein there have been a number of requests for further information. How do they make these cows give so much milk and what is the use of it?]

I have received several letters regarding my cow, whose picture was published in THE R. N.-Y. One man says that the picture was a fake—that no cow ever carried such an udder. Now I can prove that it was not a fake, but a true untouched photograph. It is true that the picture was taken with the idea of showing up the cow's udder to the best effect.



GOOD SPECIMEN OF YEARLING ANGUS BULL.

That was what it was for, and by the way, that is one of the things that go to make a successful breeder in purebreds—to be able to *see* them, and then get them in shape so that others will be forced to see them. So the cow was photographed just a few hours before she calved, when she was in full bloom, plump and full, and with a fully distended udder. Then she was placed in the proper position with her udder just a little closer to the camera and her hind leg farthest from the camera pressing against the udder to throw it out and show it off. Anyone can get just as good a picture if he has the subject and tries hard enough, but there is no reason why the man who is too lazy to try should holler "fake."

In fitting the cow, I stated that I forced her dry when she was giving 30 pounds of milk per day. I did this by taking away all her feed but dry hay and then *stopped milking* her. Yes, her udder swelled up in a way to make one nervous. I did bathe her bag in hot water, but otherwise let her alone. I don't say that this treatment might not spoil some cows, or even this one next time, but one has to take chances if he would win.

The man I bought this heifer from paid $400 for her with the expectation of increasing her two-year-old record and making a profit on her. He did not dry her off, and she did not make a record with him. So I got her at $250. I have increased her record, and to-day she is worth at least $500, and her heifer calf $200 more. After the heifer's udder got soft again and the fever all out of it, I began graining her again, a mixture of ground oats (to give her life and vigor), wheat bran (as a laxative, and to lighten up her udder), hominy and oil meal to fatten her. Why hominy instead of cornmeal? Well, the hominy is not so heating, and it produces a *soft fat*, and so does the oil meal.

Remember that the test was a seven-day test, and therefore I wanted a soft fat—quickly put on and easy to get off. Her roughage consisted of mixed hay, Alfalfa and Timothy, early cut, also mangels, but no silage. Silage is good feed but too bulky for my purpose. I cannot afford to fill up the space inside my cow with anything containing so little nourishment as silage when I want her to do her best. After she freshened, but little milk was drawn from her udder at first. It was given lots of hand rubbing to keep down the "cake" and just enough milk withdrawn to relieve her. Now her feed consisted of hay and mangels, with a little bran and a very little oil meal. As soon as the swelling of the udder began to subside, I increased her grain ration, and put her back onto her former feed, with gluten added. I did not wish to get the swelling all out of her udder, for it is when this swelling is subsiding that the cow will generally test the highest.

As soon as it was practical to do so, she was milked four times a day, and fed grain and watered at every milking. She was fed grain at the rate of one pound of grain to four of milk, which is about the ratio which is generally considered safe feeding. After her test was finished, I milked her but three times a day for a short time, and then but twice. I have eased her off, and she is now giving around 50 pounds a day. I expect to grain her some all Summer, and keep her in the best physical condition, in regard to her health, that I know how. Sometime, when she is fully mature, I hope to "trot her another heat" and place her among the 30-pound cows.

Perhaps some breeders will say that I have told some "trade secrets" that might better have been left untold, but my excuse is that I believe it is best that there be no secrets. So many cows are making good tests that a good many people have come to think that a cow is no good unless she can make 20 or 30 pounds of butter in a week, while the fact re-

Prince Jonquil 85334

is a worthy son of one of America's foremost dairy cows. His dam, *Spermfield Owl's Eva 193934*, a Meridale Jersey, in a year's work ending February 28, 1914, produced 16,457 lbs. milk, 1,168 lbs. butter, with an average fat test of 6.035% The world's record is 1,175 lbs. Two previous yearly records attest her consistency in dairy work, while a daughter and practically a full sister in the Register of Merit further evidence that dairy quality runs in the blood.

His sire, *Interested Prince 58224* (Imported), has 25 daughters in the Register of Merit, with yields as high as 13,833 lbs. milk, 819 lbs. butter on yearly test. Thirteen daughters of Interested Prince and fifteen daughters of Spermfield Owl in the Meridale herd are demonstrating to us every day the remarkable productive quality of the blood lines carried by Prince Jonquil.

We are breeding to him some heifers of exceptional promise. A few of them will be sold. For particulars address

mains that all the dairy cows of the country will not average *six* pounds.

You men who claim that there is nothing to the pure blood but the way she is handled just go ahead with your best grade and test her out. If you kill her, it will not be so bad as if you had bought a $500 pure blood and killed *her*, and if she makes 20 or 30 pounds of butter a week, the joke will be on me.

Why test at all? For no other reason than to prove that we have the goods. Jones goes away and comes home with a new horse. He sits on a nail keg down at the store and proclaims to all that he has the fastest horse in town—but he never lets him out when someone in a hurry pulls out to drive past him. Smith gets a new nag and keeps his mouth shut about him, but when Brown, who has always had the best horse in the neighborhood, pulls on him some day, Smith braces his feet, and getting a good hold on the reins, just chirrups a little and leaves Brown in a cloud of dust. Then we all know that Smith has the goods.

J. GRANT MORSE.

THE STATE AND "PUREBREDS."

The State of Kansas issues licenses to owners of purebred stallions. The process of examining pedigrees seems to have shaken out a few familiar ghosts of the live stock business.

Occasionally a worthless pedigree is discovered. One man tried to account for six generations in 11 years. A case was found where the sire claimed by the pedigree was not imported until a year after the colt was born. Records are on file in this office of all stallions ever imported into America, and it is possible to check any pedigree received.

This claim of offspring born after the parent died is familiar to us. We had it in that famous old cattle case of a few years ago. We have had several cases since where breeders were mighty careless about their records—to be as charitable about it as possible. We think it a good thing for the State to take up this matter of stallion pedigrees. A good stallion costs a small fortune. There is much money involved in breeding to produce a high-class animal and a farmer should have every possible protection when he pays a good price in the hope of obtaining a high-class colt. If there is anything in pedigree at all the farmer has a right to have it straight.

There are some things about this matter of "State control" which are a mile ahead of the times. One man wants a law compelling all farmers to raise two beef calves every year. Another would make it a penalty for dairymen to keep any bull whose dam had a record of less than 250 pounds of butter per year! We hear intelligent and influential men advocating a law to make it a severe penalty for anyone to permit any rooster to run at large except during the breeding season for poultry. The object of this is to compel the production of infertile eggs. Many of such things are properly put under the head of "fool legislation," or a clear interference with the rights of a man to conduct his business in his own way. In this use of "pure blood" a farmer should have some protection from the State.

Why I Breed Black and White.

Because they will produce more milk for the feed they consume than any other breed.

They are persistent milkers, and will give milk within a few days of freshening. I can obtain three times as much for the bob calves as for the smaller breeds. I sell all my calves from my grade cows when three days old for $7.50 each. These calves bring two-thirds more when accident renders them useless as milkers. I speak from experience, as I formerly bred Jersey cows, grades and purebreds.

My 21 milch Holstein cows give more milk than my 35 Jerseys. It is all bosh about Holsteins going dry for such a great length of time. We have great difficulty in drying up some of my Holsteins. Further, they are not so susceptible to the prevailing diseases among the smaller breeds of cattle.

New Jersey. W. P. BAINBRIDGE.

WAITER: "Were you ringing the bell, sir?" Customer (after long wait): Ringing it! Great Scott, no! I was tolling it—I thought you were dead!"—Everybody's Magazine.

DAIRY CATTLE

A Pontiac BULL CALF
BORN FEBRUARY 18, 1914. GET 44 lb. STOCK

Whose dam—grandam—and great grandam; Whose sire's Sister—dam and grandam are all A. R. O. Cows. His Sire's full sister is a 27 lb. 3-year old—fat, 4.5%. In his four generation pedigree are 12—30 lb. cows. Eleven cows who have held (11) "World's records" in their classes, and 1—25 lb. 2½-year cow, and 1—44 lb. cow. His dam carries over 40% the blood of the "World's Champion Butter Cow." K. P. Lass 44 lb. Butter 7 days—171 lb. Butter 30 days, etc. This bull is nicely marked—more black than white. A very soft coat. Active and intelligent. He will make a show bull—Price, $100.00. All papers. Crated. For pedigree address

Purebred Registered
HOLSTEIN CATTLE

To promote general prosperity and their own business, bankers in many parts of the country are buying purebred Holsteins by the carload and selling them on time to the farmers of the community.

Every year it becomes clearer that with large yield cows the cost of milk and butter production can be brought down to a point that makes dairying profitable.

A herd of purebred Holsteins is an investment that combines safety with large dividends.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

A Dairy Ration.

Can you balance a ration for my dairy from the following feeds, using all or some of those named? I am feeding silage, oat straw and Timothy mixed. I mixed 100 pounds brewers' grains, 100 pounds cottonseed meal, 80 pounds linseed meal, 100 pounds sucrose (molasses feed), 200 pounds ground oats and cornmeal (one-third oats to one-third corn) and 100 pounds buckwheat middlings together. How much of the mixed feed should I give a cow per day? My cows are good grade Holsteins but do not give as much milk as they should. H. D. W.

New York.

Your grain ration is a very good one as it stands. I should advise feeding one pound of the mixture to 3½ or four pounds of milk. If the cows gain in milk increase the grain proportionately. The best way to feed the grain is to scatter it over the silage. C. L. M.

Ration for New Milch Cows.

Will you give a balanced ration from the following feeds for new milch cows, weighing from 600 to 800 pounds? Bran, $1.40; gluten, $1.60; cottonseed, $1.80; meal, $1.50. I have mixed hay and corn silage. Silage was made of the Early Mastodon corn about half eared. M. T.

Wayne Co., N. Y.

The following ration ought to be satisfactory:

	Dry Matter	Digestible Protein	Total Digestible Nutrients
Silage, 30 lbs.....	7.920	.420	5.160
Mixed hay, 10 lbs....	8.710	.580	5.050
Bran, 2 lbs.	1.762	.238	1.190
Cottonseed meal, 3 lbs	2.790	1.128	2.418
Cornmeal, 2 lbs.....	1.808	.136	1.680
Total	22.980	2.502	15.498

Nutritive ratio, 1:5.2.

It is not to be understood that the amounts of roughage given should be rigidly followed. The amounts of silage and hay you have on hand should be taken into consideration. The amount of grain also will depend on the milking capacities of the cows. C. L. M.

Ration for Jersey.

I would like a balanced ration for Jersey cow. I have clover hay and can buy the following grains: Cornmeal, per cwt., $1.65; bran, $1.30; middlings, $1.40; oil cake, $1.85; ground feed (corn and oats), $1.35. G. W. W.

Wisconsin.

Feed the cow three times daily all the hay she will eat up clean. For the grain ration feed two pounds bran, three pounds oil cake and two pounds corn and oats. It is better to give the grain at two feedings, morning and night. C. L. M.

Ration for Sow and Pigs.

What is the very best and cheapest ration for a brood sow with nine pigs? At present I am feeding equal parts of oats, barley, middlings, and bran, about four quarts three times per day in her slop. Would it be all right to put some cornmeal with her feed? Will you give a ration for the pigs after weaning? My old pig pasture is about run out. Could I plow it early in the Spring and seed to something for early pasture? What would you advise sowing? I have a piece of new land that I plowed last Fall. Would like your advice on what to sow on it for pasturage. How would cow peas and oats do, and would they be safe to turn cattle in as regards bloat?

New York. L. M. S.

L. M. S. could safely add some cornmeal to the ration that he is now feeding his brood sow with pigs. In fact if he has grown the corn on his own farm it should constitute the bulk of the ration. The following feed mixture has given us very satisfactory results with brood sows suckling pigs: Ear corn, 100 pounds; digester tankage, 10 pounds; wheat bran, 15 pounds; oil meal, five pounds; bone meal, two pounds; salt, one pound. The corn is fed without any preparation whatsoever, and the balance of the ingredients are fed in the form of a thin slop twice daily. If it is desirable to use cornmeal it can well be mixed with the other ingredients and fed in the form of a thick slop twice daily. As to the amount to feed it is our rule to give the brood sows all they will clean up with relish after the pigs are old enough to make demands on their system, but during the first three weeks they are fed rather sparingly, as it is desired to let the pigs get hungry, and take some exercise in their endeavor to get sufficient milk, rather than allowing them to get an abundance of milk without any effort and then cuddle up in a corner and probably contact thumps.

Dwarf Essex rape probably leads the list of crops that can be grown during early Spring suitable for foraging swine. Alfalfa, of course, heads the list, but when you consider a crop to be seeded during the early Spring, rape is the most excellent one. A little variety, however, is desirable, and a mixture made up of oats, Canada field peas, rape and Red clover make a most excellent mixture, and instructions as to method of planting, etc., have been given repeatedly in these columns. Oats and peas from a dairyman's standpoint had best be fed as a soiling crop, rather than pastured by the cows, inasmuch as the ground is soft, and they do considerable injury to the plants if permitted to roam through the fields. With pigs, however, there is less waste, especially if it is possible to seed the material in rows rather than broadcast or drilled. F. C. M.

Ration for Montana.

Will you prepare a milk ration from the following feeds? Timothy hay, or grain hay (oats, wheat or barley); oats, barley, wheat, bran, middlings, shorts and flax meal; any of these may be obtained. Could you also give me some information about where a feeding chart, may be obtained? H. L. E.

Montana.

If the grain hay was cut before the grain was mature, its feeding value would be similar to that of good Timothy hay. If ripe, then its value is less, especially the wheat. Feed the cows all the hay they will eat up clean two or three times daily. For a grain ration mix two parts by weight of wheat bran, three parts flaxseed meal and three parts ground oats. Feed an average cow, giving 25 pounds of milk daily seven pounds of grain per day.

The U. S. Department of Agriculture, Washington, D. C., will furnish free bulletins on the subject of feeding. Bulletin No. 321 of the N. Y. College of Agriculture, Ithaca, N. Y., is very good, and perhaps your own experiment station at Bozeman can furnish something. The work of Prof. W. A. Henry, entitled "Feeds and Feeding," is the most complete I know about. It may be purchased from THE R. N.-Y., price $2.25. C. L. M.

"WHAT is a gusher in an oil field?" asked the Old Fogy. "The man who writes the prospectus," replied the Grouch.—Cincinnati Inquirer.

DE LAVAL CREAM SEPARATORS

are the cheapest as well as the best

LOOK AHEAD!

DON'T TRY TO SAVE $10.00 TODAY if it means a loss of 25 cents a day for all the years a cream separator may last you.

THAT'S JUST WHAT YOU WILL do if you buy a cheap or inferior cream separator simply because its first price is a little less than that of the De Laval.

WHEN A PRUDENT MAN BUYS a cream separator he knows that what he is really paying for is not just so much iron, steel, brass and tin, whether it is called a separator or not.

WHAT HE WANTS IS A MAchine to perform a certain service, and he must be sure of the machine doing the work for which it is intended as thoroughly and with as little effort as possible on his part.

THOUSANDS OF BABCOCK AND other tests have proved that the De Laval skims closer than any other cream separator under any conditions, and particularly under the harder conditions always experienced at times.

JUST THINK WHAT A LOSS OF as little as 10 cents worth of cream at each skimming means to you in a year—twice a day for 365 days—over $70.00, and with as many as ten cows the cream losses alone from an inferior separator usually amount to more than this.

CREAMERYMEN, WHO ARE DEpendent on their separators for business success, have long since found out the difference between De Laval and other separators, with the result that De Laval factory separators are almost universally used the world over today.

DE LAVAL SEPARATORS ARE identical in all sizes, for one cow or a thousand, and the differences between separators are just the same with the smallest machine and the largest. They mean as much relatively to the little as the big user.

THEN THERE IS THE SAVING in labor because of the easier running and greater capacity of the De Laval over other machines and the less care required in cleaning and adjustment, worth at least 10 cents a day.

AND THERE IS THE INDISputable fact that a De Laval machine lasts from ten to twenty years as against an average of from two to five years in the case of other separators, or five times the average life of competitive machines.

THESE ARE THE REASONS why De Laval Separators are cheapest as well as best, why thousands of other machines are yearly being replaced with De Lavals and why their use is rapidly becoming as universal on the farm as in the creamery.

IT SHOULD BE REMEMBERED, moreover, that if first cost is a serious consideration a De Laval Separator may be bought on such liberal terms that it will actually save and pay for itself, as many thousands of them have done.

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer.
If you don't know the nearest De Laval agency simply write the nearest main office, as below.

The De Laval Separator Co., 165 Broadway, New York, 29 E. Madison St., Chicago

Value of Skim-milk.

What is skim-milk worth (run through a separator) per quart to feed pigs? I can get it for one-half cent per quart. Is it worth it? F. W. C.
Massachusetts.

Like all other feeds, skim-milk varies in value with the price of products which may be obtained by its use. When pork is high, food that will produce pork is worth more than it is when pork is low. Skim-milk is relatively more valuable for young pigs than for old, and its value is further increased if it is fed with grains which supplement it as a ration. In general, skim-milk is usually valued at from 20 to 25 cents per hundred pounds. At one-half cent per quart, you are paying 23 cents per hundred, a fair value for this dairy by-product.

Giving Away Butter Color.

It has been the custom in some of our local markets to give to each purchaser of oleomargarine a little package of coloring material with carefully worded directions about using it in the oleo. Is it lawful for dealers to give this colored matter out in this way? S. F. J.
New York.

In answer to this, I advise you that the statute in relation to coloring matter reads as follows:

"No person selling any oleaginous substance not made from pure milk or cream of the same as a substitute for butter shall sell, give away or deliver with such substance any coloring matter."

You will note that the prohibition above set forth is selling or giving away *with* the oleomargarine. It does not say that it shall not be sold 15 minutes after, from some other part of the store, or given away at some other time or place. The constitutionality of this statute was questioned, and a case was tried in Brooklyn, and the law declared constitutional; an appeal was taken by the dealer; the Appellate Division affirmed the decision of the lower court, and an appeal was then taken to the Court of Appeals. This appeal was argued but a short time since, and a decision handed down within the last two weeks, in which the law was held constitutional. We are now advised by a representative of the oleomargarine interests that they are prepared absolutely to observe the requirements of the statute.

G. L. FLANDERS, Counsel.

Trouble With Butter

"What is wrong with our butter?" Some years since, while driving through a section of familiar country, I called at a farmhouse. While at the table the hostess, knowing that I had long continued the making of Winter butter on the farm, began to apologise for the poor butter, asking me to give her the reason for such inferior quality. I noticed the general appearance suggested having been overworked, as the result of carelessness in allowing the granules to unite into lumps containing a quantity of buttermilk that had to be worked out. Flavor was decidedly off, which many times can be attributed to improper care of dairy utensils. But in this case with complete order and neatness prevailing I must look further. Following others to the barn to turn out cows to water and feed at noon, on entering the door I met that stagnant blast, such as we find in a tight stable with small space for cow and no ventilation. One of the party watered the stock, while the other was throwing down unripe western corn fodder. In passing through, I noticed four or five inches of refuse in the way of corn butts, etc., in bottom of manger. I remarked to the man putting this unripe woody corn into the manger, "How often do you feed this kind of fodder?"

"Three times per day."

"For how long?"

"Since last Fall."

I asked if they had no hay but was told they wanted to use up the fodder. No grain was given, depending on this corn alone. This lack of proper ventilation and improper ration was largely responsible for the poor butter. In a dairy of any size the most valuable person in the farm is he who thoroughly understands and puts into practice, scientific feeding and constant care of the milch cow. In many kinds of work, neglect does not involve any great damage more than the percent of labor not performed.

Clinton Co., N. Y. S. GORDON.

PRICES FOR NEW ENGLAND MILK.

There has been so much variation of prices paid for the New England milk sold to Boston dealers this past Winter that perhaps a glance at these prices may be interesting. The Deerfoot Farm Co., I think, paid the best of any contractor. Their October and November price was 42 to 45 cents per can, according to quality. December and January, 40 to 43; February and March, 38, making an average price of 40 cents or better for the six months. The price paid by Allen Bros. was: October, 38; November and December, 40; January and February prices are in doubt, some claiming 40, others 38; March probably 36, but no one seems to know for sure. Hood's prices were: October, 40; November and December 43; January and February, 40 and 38; March 36, an average price of 40. The Whiting Co. paid about 35 average for the six months in the territory distant from Boston, about the same as the above Alden and Hood prices. The above prices, except the Deerfoot, are highest paid by these companies the past Winter.

For some milk sold at retail the Deerfoot Co. paid several cents better than the price quoted above. Now we come to peddlers, or small dealers who are and have bought their milk direct from producers in Massachusetts, Southern New Hampshire and Western Maine. These people have paid an average price of about 40, regardless of distance from Boston. A few have paid 42 to 45 for nearby Massachusetts milk. A few of these also agreed to pay this price from last October to the coming October, but only two or three have kept the agreement to date. Most of them changed their mind this Spring when they saw the big contractors offering a cut price from last year, and they followed the same policy, and in many cases have gone even further and stopped buying independently for reason in most cases of pressure being brought by the big contractors in one way or another.

In some cases the contractors offered them milk at a lower price by considerable than these peddlers had been and were paying the producers, and gave them a further privilege of buying just what they needed from day to day, and as this quantity varies quite a lot it is a big advantage to these peddlers, as when they bought from the producer direct they had to take as the rule what was sent them, even if more than they could dispose of in regular lines of trade.

Now the question is, what are these producers who have been dropped by these peddlers going to do? Some have found a market with the big contractor who buys milk in or near their locality but at an unsatisfactory price. Others are trying to find a market for their product as cream or butter, and probably those with the cream proposition will be better off in the end by returning to, or keeping on their farms much fertility which they have been practically giving away in form of whole milk by selling at a price almost or quite below cost of production. This may be true in the butter question also, but at present prices this is perhaps a question. Other producers, and they are not a few, are offering their cows for sale, feeling hopeless in some cases of ever seeing a paying proposition in the sale of market milk under the condition and prices that now or in future will exist. In one section near Boston the producers are offering their milk free to the poorer class of consumer, hoping in this way to force the dealers to try to pay a fair price for this milk. Just how this idea will work out will be worth watching. Taking the situation as a whole it is as bad as or worse than ever known before. I believe yet a few months from now may make a different showing as influences are at work and will be further spurred up by present experiences to bring about a great change for the better.

The contractors with one exception have refused to accept the farmers' offer to leave the whole question of fixing a price with the Boston Chamber of Commerce. This is no credit to these contractors and will in the end hurt them more than the little they may gain by having their way or gaining their point at this present time.

A few producers by selling direct to large consumers, restaurants, hotels, etc., are getting eight and ten cents per quart by the can for first-class, clean, sanitary, rich Guernsey milk. The great trouble is these cases are comparatively rare and do not help the general conditions much except as an example of what is possible if best efforts are put forth to produce a high-class article. The farmers were very blind when they went against a bill before the Legislature last year to label place of production of milk sold in Boston. The producer who is ashamed to let it be known what town or State his product comes from, but is willing to let the contractor sell the same for nearby milk, when produced hundreds of miles away, deceiving the consumer in this or any other manner will not help conditions or produce confidence in the buyers' mind, and you cannot sell an article to advantage to any buyer who has not full confidence in the seller and his product.

AILING ANIMALS.

Rudlmentary Teat.

I have a young cow that has a small teat attached to one of the regular ones. It leaks a little when milking. Is there any remedy for it? She is nearly dry, and if there could be anything done would like to try it now. A. T.

The teat may be amputated by a qualified veterinarian when she is dry; or obliterate tbe milk duct in that teat by inserting a red-hot knitting needle. The operation by the expert is preferable treatment. A. S. A.

Fits.

I have four pigs farrowed in December. I have fed them four quarts of wheat feed and cornmeal mixed, and two quarts whole corn a day, not much milk. The pigs seem to grow well; lately when I feed them, as soon as they begin to eat they go in fits. They have not had a very warm place, but have had a dry place to sleep. They do not get much exercise. Could you tell me what I could do for them? M. G. T.

New York.

Indigestion from overfeeding and lack of exercise causes such attacks as you describe. Stop feeding the present rations and substitute a light slop of wheat middlings, ground (screened) oats, a little cornmeal and a little flaxseed meal. Make it up with hot water, just thick enough to pour well and add a pound of salt per hundred pounds of the dry feed. Allow free access to Alfalfa or clover hay and if possible supply roots. Make the pigs take abundant exercise by rooting for whole oats sprinkled on a big barn floor and covered wth litter. Have them run out as much as possible. Keep tbe bowels active, if necessary mixing a few ounces of raw linseed oil in the slop. A. S. A.

Bloating.

I have a two-year-old heifer due to calve in six or eight weeks. I have been feeding two bushels oats, three bushels corn, ground together. I give her, twice a day, one quart of the above feed and one quart of wheat bran. She has been doing well until last week. I found she was bloated quite a little and did not want to walk; lost her appetite. What can I do for her? Do you think it is her kidneys? Is tbe ration I am feeding all right? For roughage I feed cornstalks and clover hay. S.

Long Island.

The cow had an attack of indigestion and should have had a dose of pbysic. For bloat give two ounces of turpentine shaken up in a pint of raw linseed oil. A cow should have a pound of grain mixture for every three pounds of milk she produces, as well as good hay and silage. A. S. A.

Indigestion.

I have an old mare tbat does not gain in flesh; bad teeth fixed a year ago. I feed three times a day 3½ quarts chop each time (eight bushels oats, two rye, two buckwheat, three shelled corn ground together). She makes water often and when driven off a walk or pulled hard urine somewhat bloody and mare will strain in passing it. I. M. T.

Pennsylvania.

Do not feed ground feed to a horse. Keep it for the cows and hogs. Feed whole oats, adding one-ninth part of wheat bran and allowing one and one-quarter pounds of mixture for each hundred pounds of body weight as a day's ration. Also feed one pound of good hay per hundred pounds of body weight. Work or abundantly exercise the horse every day. Allow free access to rock salt. A. S. A.

Horse Sleeps Standing Up.

Last Fall my horse got cut in his hind ankle, was in sling about five weeks. He is in good shape, works well, but never lies down for rest. The cut from scraper cut one of the cords. I put him in a box stall 8x10 but he keeps standing. Is there anything to do for him?

New York. I. K.

Each time the horse comes in from work take off his harness and lead him to a sand heap, or soft place where he may feel like rolling. Pasture him in Summer. Bed well at night. He may in time lie down, but there is no way of making him do so, other than casting him with ropes. He will sleep well in the standing posture. A. S. A.

Dishorning.

I have several cows and heifers that I expect to have dishorned this Spring. About how soon should this be done so the green flies will not give me any trouble? Tbe last lot I had dishorned in tbe Fall. Some cows were very long in healing and one cow never did beal and never carried any calf long at a time; the dishorning caused abortion. She was fat and always looked well and I sold her to a dealer. One other cow suffered from flies and eventually died. Would flour from wheat or pulverized clear starch be good to put in horn to stop the bleeding and cause them to heal, or is there a special preparation for this purpose? The man who does the work around here does not use anything on the wound or inside of horn. Should the dishorners be sterilized after dishorning each cow? If so what is best for this purpose? W. L. M.

Delaware.

Do the dishorning any fine, mild day in Spring, before flies start to bother. Dress the horn stumps with pine tar. If any one bleeds, soak a wad of oakum in Monsel's solution of iron and bind on the part. Have the horns cut off close down in the hair and skin of base; then there will be less trouble. Place the dehorners in boiling water for 20 minutes before use and cleanse in a hot, five per cent. solution of carbolic acid or coal tar disinfectant after dishorning each cow. A. S. A.

Hog Cholera.

In December I bought a registered White Chester sow. Had her about a month when she was taken sick; would not eat anything and shook as if cold. Skin turned a dark blue and she had great difficulty in breathing; died after being sick two weeks. Since then a boar has died of same disease, and now another sow has it; seems to be very contagious. What is the disease? Was it brought on the place by the sow I bought in December? Will it be safe to keep hogs where they have been? Is there any cure for it? V. V. V.

New York.

The disease no doubt is cholera, and if that is so it will be necessary to have all hogs immunized by vaccination, else they will die of the disease in the infected yards and houses. Any graduate veterinarian can do the work, using reliable, fresh serum. We cannot say how the disease was introduced. A. S. A.

Feeding Cows in Calf.

Wby sbould cottonseed meal not be fed to cows in calf, and how soon after parturition can it safely be fed? If cottonseed meal and cornmeal are harmful, what is safe to feed and how much?

Vermont. A. P.

Both cottonseed meal and cornmeal may safely be fed to cows in calf; but only as a part of a grain and meal ration. Do not give over half a pound of cottonseed meal, twice a day, during early gestation, and reduce to balf a pound as the cow becomes heavy in calf. Corn meal need not be reduced in amount on account of gestation, but less of it is needed in hot water. Apply to your State Experiment Station for free bulletins on cow feeding. Make no sudden changes of feed. Bring cows gradually onto any new ration, then no damage will be done. A. S. A.

TEACHER (explaining fractions): "Suppose, now, Willie, you had eight little boys visiting you, and you had only one apple; how much would each little boy get?" Willie: "Wouldn't get any. I'd wait till they'd all gone home and eat it myself."—Boston Transcript.

Roof With Fireproof Asbestos

Send for Samples

Strongest fire protection yet offered. Famous Waterproof Breco Rubber Roofing with thick top layer of Ashestos. World's greatest fireproofer ALL WHITE ROOF. Turns back sun's rays instead of absorbing. Handsomest and most durable roof for any kind of building.

Interlocking Device

Flying Dutchman Hay Tools

This Trade Mark Stands for Reliable Farm Tools.

To make the most money out of your hay crop, you must handle it quickly.

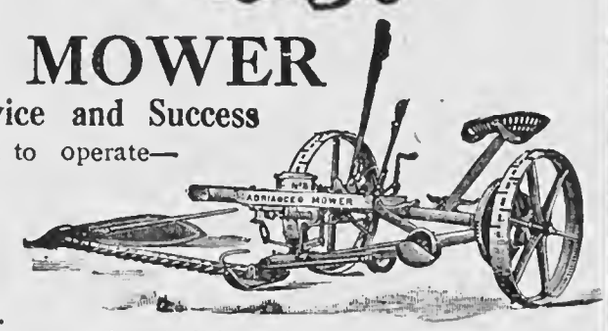
You must know positively that your machines will be in shape to work from early till late without one moment's delay.

FLYING DUTCHMAN HAY TOOLS are the best made—most reliable hay tools on the market. They can be depended upon every minute of the haying season.

Many users say "They are trouble proof." They are so simple in construction; so easy for the inexperienced person to operate that they should and have in hundreds of cases run for years without one minute lost during the haying season nor one cent spent for repairs.

ADRIANCE MOWER

60 Years of Unequaled Service and Success



Simplest in construction—easiest to operate—lightest draft—most powerful cutter—needs fewest repairs.

Adjustable Carrying Spring takes unnecessary weight off the Cutter Bar and puts it on the wheels, reducing draft and increasing traction power.

Automatic Spring Draft prevents damage when striking obstructions.

Knife starts instantly when thrown into gear. Adjustable Hard Steel Wearing Plates keep the knife head in correct position. Cuts like new after many years of use.

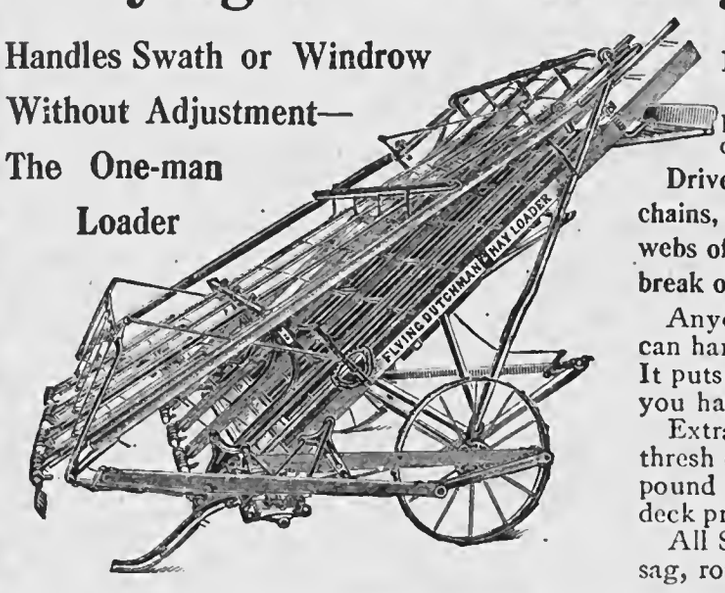
Cutter bar moves up and down freely without binding, and always follows the ground, no matter how uneven it may be. It folds over the tongue, insuring against accidents. No bolts to fasten.

Exposed Pawls and Ratchets save trouble and repair bills.

Forward Acting Foot Lever is natural, easy and safe.

Flying Dutchman Hay Loader

Handles Swath or Windrow Without Adjustment—The One-man Loader



Positively the simplest Loader ever made.

A one-man loader—simple in construction, practical in operation.

Driven direct from axle, without chains, cogs, sprockets, gearing or webs of any sort. Nothing to lose, break or get out of order.

Anyone who can drive a team can handle this loader ALONE. It puts on a big half load before you have to touch it with a fork.

Extra long stroke does not thresh out the seed, break hay or pound the machine. Yielding deck prevents clogging.

All Steel Frame cannot warp, sag, rot or get out of shape.

See your FLYING DUTCHMAN DEALER about these machines. Also FLYING DUTCHMAN SIDE DELIVERY RAKE and TEDDER and ADRIANCE ALL STEEL DUMP RAKE.

Write us for FREE BOOKLETS.

MOLINE PLOW CO.

Dept. 119 MOLINE, ILL.

No Dead Furrows—No Unsightly Ridges

Clean, uniform, one-way plowing—the kind that makes a deep, rich, well tilled seed bed and produces largest crops—that's the kind of work you can do with the

"Lovejoy" Reversible Sulky Plow

Made throughout of the best malleable iron and first grade steel, the "Lovejoy" is a plow for superior work on any land. Adjustable pole does away with side strain and regulates width of furrow. Double plows, used alternately and adjusted by foot lever. Other valuable features.

Made in two sizes—fully described in our big new catalog. Send for this book—it tells all about our famous Cambridge plows. Every farmer needs it.

Write for our new catalog. It is free.

Products, Prices and Trade.

PRODUCE RECEIPTS AT NEW YORK.
Week ending April 9.

Butter, lbs.	2,482,160
Eggs, doz.	5,490,950
Apples, bushels	58,350
Potatoes, bushels	123,027
Hay, tons	6,149
Wheat, bushels	334,040
Corn, bushels	11,500
Oats, bushels	255,000

Wholesale Prices at New York,
Week Ending April 10, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Last year the following premiums over contract prices were paid high scoring dairies: April, May and June, seven cents per 100 pounds; July, eight; August, 10; September and October, 11; November, five.

Wholesale prices paid by New York dealers are in some cases 10 cents lower. $1.61 and $1.51 per 40-quart can for B and C grades. A drop of 10 cents per can has been made to restaurants and hotels, those using three to four cans per day now paying 5¼ to 5½ cents per quart.

BUTTER.

Prices during the week have run a fraction of a cent above last report, but the market is unsettled and generally in favor of buyers. Holders, except those controlling special marks, have been quite ready to make reductions in order to move their stock.

Creamery, extra, lb	25 @ 26
Good to Choice	22 @ 24
Lower Grades	19 @ 21
Storage	17 @ 23
State Dairy, best	24 @ 25
Common to Good	18 @ 23
Factory	15 @ 18
Packing Stock	12 @ 16

Elgin, Ill., butter market firm at 24½ cents.
Philadelphia, western creamery, 26 cents.

CHEESE.

The receipts of new made whole milk have been so heavy that a drop of two to three cents is noted and the market is in a decidedly uncertain state, especially on medium grades. Well cured new make is held firmly, and the same is true of high grade old. About 800 crates of New Zealand cheddar have been received at New York via London, selling mainly at 18 cents. The quality is good.

Whole Milk, new, best	14 @ 15
Old, best	19 @ 19¼
Common to good	15 @ 18

EGGS.

Business the early part of the week was good, owing to the Easter trade. Receipts were large, 1,880,000 dozen the first two days of the week. White eggs from nearby are more plentiful, and have to be large to bring the top quotations. A fair quality of European stock is selling at 18 to 19 cents, and fresh gathered from the Central West, 20 to 21. The quite common practice of mixing eggs tested out of incubators with new laid is not to be recommended. There is, of course, a difference in tested-out eggs, but they are not like normal fresh eggs and will not satisfy buyers of such stock. Experienced handlers can pick out these eggs by the appearance and feel of the shell, and such mixed lots are discounted—usually more than the mixture warrants. As a matter of business results will average better if the tested-out eggs are kept by themselves and sold for what they are.

White, choice to fancy, large	24 @ 25
Common to good	18 @ 22
Mixed colors, best	21 @ 22
Common to good	17 @ 20
Western fresh, white	22 @ 24
Lower grades	17 @ 19

FRESH FRUITS.

Receipts of apples rather light, and market decidedly firm. Strawberries in open crates are arriving freely, wholesaling mainly at 25 to 35 cents.

Apples—Spitzenburg, bbl.	4 00 @ 5 50
Spy	4 00 @ 7 00

Common to good	36 @ 40
Pacific Coast	19 @ 22
Old stock	15 @ 18
German crop	65 @ 70

VEGETABLES.

The potato market is quiet, but the price advances reported have been held, and in some cases a shilling per barrel added. The supply at New York now is chiefly Maine stock, which shows good quality. Prices paid at primary points in Central and Northern Maine do not vary much from one cent per pound, and the same figure is prevailing in interior New York markets, though many farmers are inclined to hold for more. In the Middle West farmers are getting 45 to 50 cents per bushel, with supplies scarce at many shipping points owing to bad roads. Many Minnesota farmers refuse to sell for less than 50 cents, which local buyers are unwilling to meet. Seed stock has been selling in the Central West at 55 to 75 cents, according to varieties. Choice Early Ohio and Cobbler have brought 80 cents in some cases. Several cargoes of foreign potatoes arriving at New York recently have been refused admission on inspection, and either destroyed or reshipped to other points. New potatoes from Florida are generally higher and selling well. New cabbage in heavy supply and dull. Asparagus is arriving freely and selling in the range of $1.75 to $3.50 per dozen wholesale.

Potatoes—Maine, 180 lbs.	2 50 @ 2 75
State, bulk, 180 lbs.	2 25 @ 2 50
Michigan, 180 lbs.	2 25 @ 2 50

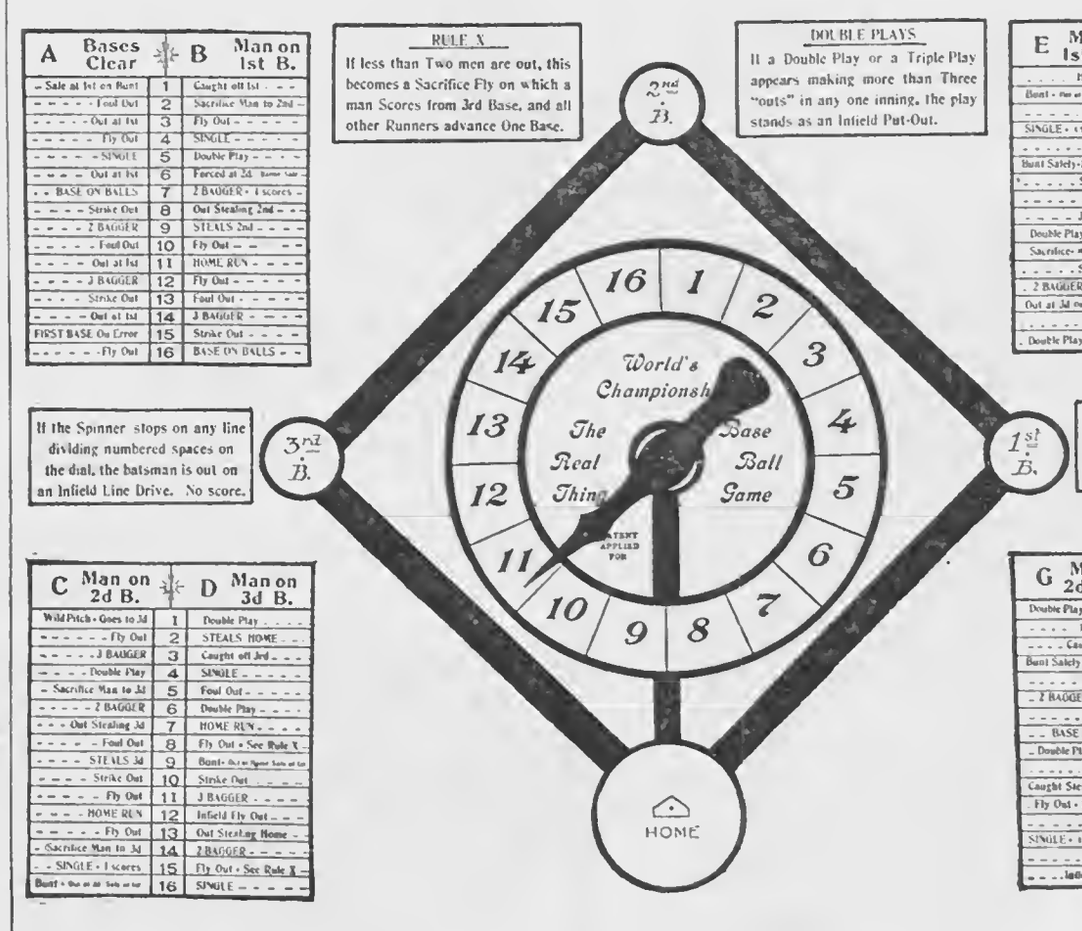
LIVERPOOL TROLLEY STOP 22

BOYS, PLAY BALL AT HOME!

"The World's Championship Base-Ball Game"

A scientific adaptation to our great National Pastime. ∴ A Parlor-Game, enjoyed by Old and Young. ∴ Real Base-Ball with a Spinner for the Ball and a Dial for the Bat. ∴ Played strictly according to Regulation Rules.



THE GAME

consists of the Game-Board, Spinner and a Set of 13 Counters. Size of Game, 14 x 11 inches.

The Game-Board is printed in three colors, on yellow, glazed paper and mounted on heavy ⅜-inch Compto-Board, giving the Game not only a very attractive appearance, but also making it practically indestructible.

The Spinner is stamped out of heavy Brass.

The Counters are of three different Colors—5 each, red and blue, for use as Base-Runners of the opposing Teams, 3 to count the Put-Outs.

This game will be sent to you postpaid for

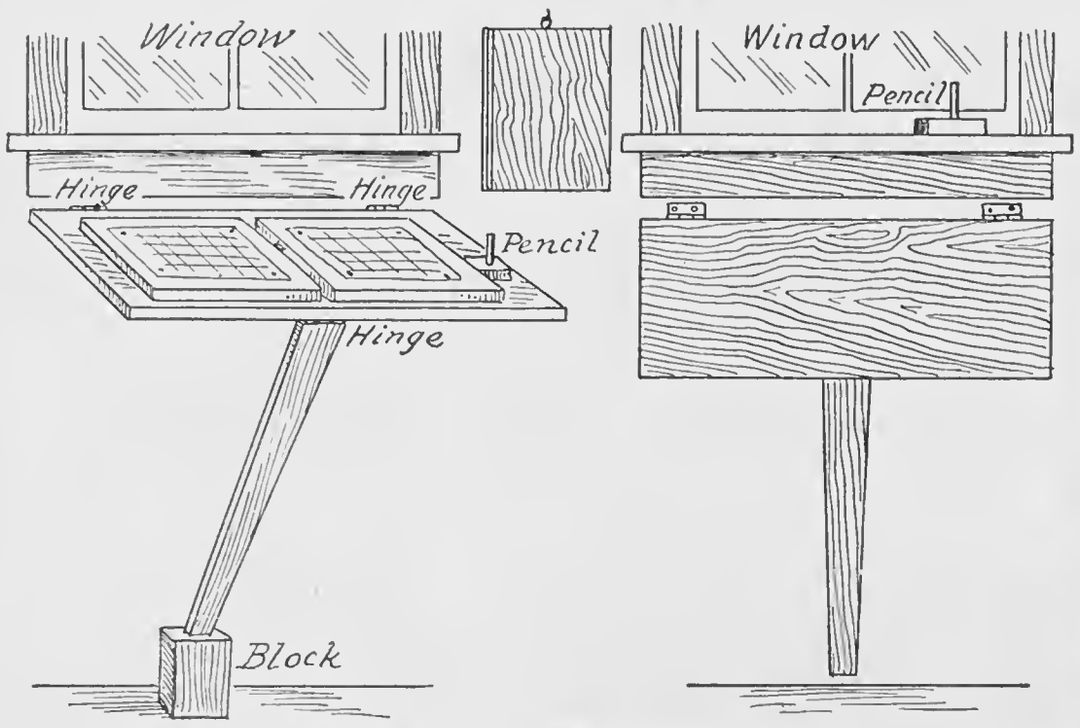
DESK FOR MILK RECORDS.

I suppose there are no dairymen willing to answer to that name who do not keep records of the milk their cows give. We have kept tally of our cows for about 20 years and either tested samples of the milk or had it done for us, so that we know what our cows are doing. Most dairymen keep tally sheet tacked to the wall, but we found a handier way by making a sort of desk hinged to the wall at a convenient height, with a hinged leg, the end of which rests on a block, but may be let down so as to be flat to the wall. Here in Maine we can get blanks from the Department of Agriculture free, by filling out other blanks which they send with our year's work and returning to them. The blank for 20 cows is 13x17 inches. I took two planed boards



BARN DESK FOR MILK RECORDS.

of that size and hinged them together with screw rings in the outer edge of one and a hook on the outer edge of the other, so that when they were shut up the hook would catch over the screw eye and the screw eye was left to hang the board on. Tack the sheets on the inside of the boards and when not in use they are kept nice and clean. The top of the desk is 14½x34 inches, just right to lay the open sheets on. We use a short pencil, and instead of a string we use a block of inch-board 1x½x1½ inches with a hole in the middle of it. The scales are hung on a wire, fastened overhead. The picture explains the device.

Maine. C. H. FULLER.

Muslin Curtain Ventilation for Stables.

I would like to have some information on ventilating barns by the muslin curtain method. In your issue of June 15, 1907, H. E. Cooke, in answer to an inquiry, said that he had not tried the muslin curtain, or rather had not studied the system long, but that if he was building a new stable he would put in the cloth curtains and try them thoroughly, before resorting to any other means. I have not seen that he has made any comment on the subject since, and I wonder what his views are now. I would like to know if this system requires an outlet flue, and also if the barn walls have to be so carefully insulated as the King system requires. C. B. C.

Indiana.

Yes, I have had considerable experience with muslin curtains since 1907, at my farms and also at the State School of Agriculture at Canton. My experience and observation would sum up about like this; Muslin curtains are useful, and have a place in barn ventilation, but they do not take the place of flues. In a poultry house muslin does the work to perfection, and flues are a nuisance, as draughts of air will form downward and disturb the fowls. In fact, the poultry house does not require so frequent a change of air as a cow stable, and the curtains are just right. In a stable, however, where two pounds of live weight are kept to each cubic foot of air space, and a steady constant inflow and outflow of air is necessary, the curtains are not efficient unless the space is so large that temperatures are low and uncomfortable for dairy cows. Under such very large exposure and low temperature the air will show less humidity than with the flues, but the gain will not offset the low temperature. There is really no scientific principle involved in a muslin curtain ventilation; it is just simply a hole in the wall so finely divided that a direct draught is not formed against the animal. Wind pressure will control the changes to a much more marked degree than with the flues. Wind pressure affects every form of gravity or direct ventilation but with the flues it is reduced to a minimum.

I have made a combination of the flues and curtain for early Winter, that is late Fall and late Winter or early Spring use. There is a time when the flue circulation is sluggish and the muslin is helpful as an assistant. Of course for those who have no flues by all means put in muslin at once; the change will be surprising. H. E. COOK.

One day Mr. Smith went to buy a bushel of buckwheat for sowing. The man who sold the wheat was away, but the wife undertook to make the sale. She found a peck measure, and they went to the granary. She filled the measure twice, poured the contents into the bag and began to tie it up. "But, Mrs. Lawton," said the man, "It takes four pecks to make a bushel." "Oh, does it?" replied the woman, untying the bag. "Well, you see, I never had any experience in measuring grain before I was married. I always taught school."—Harper's Magazine.

Power of Concrete

Cement largely determines the power and endurance of concrete. Good, clean, sharp sand, gravel and water are necessary, but you must have the right cement also—uniform and high in strength to make sure of good concrete.

LEHIGH PORTLAND CEMENT

—the cement that has earned a reputation for its unusually high tensile strength. This strength grows greater each year and imparts to the structure a strength that increases with time.

Send for our book, "The Modern Farmer." It tells about Lehigh Cement and how to make concrete fence posts and other farm structures. It's free.

Lehigh Portland Cement Co.
601 Young Bldg., Allentown, Pa.
106 Consumers Bldg., Chicago, Ill.

Make your fence posts of concrete. They last forever; won't rot, decay or break and never need repairs. Make sure and use Lehigh.

Molassine Meal

MADE IN ENGLAND

Unique—Distinctive—Superior

It is made by a *specially prepared process* which produces a feed absolutely unlike anything else in the world.

For 20 years it has watched imitators come and go, but today Molassine Meal holds the field as the *one and only feed* of its kind that *will produce the results* claimed.

It is today being fed and recommended by Agricultural College graduates, who having carefully educated themselves in the theory of farm problems, now find Molassine Meal in every day practical farm life produces most satisfactory results.

Insist on having Molassine Meal, as nothing else will take its place.

If your regular grain dealer will not supply you, write us—in fact, write us anyway, for we are quite sure we can improve your feeding ration.

MOLASSINE COMPANY OF AMERICA 326 Board of Trade, **BOSTON, MASS.**

The Henyard.

THE EGG-LAYING CONTEST.

The twenty-second week, ending April 3 shows a still further gain in egg production, though the gain is only 49. Barron's White Wyandottes tie the big score made by the Barred Rocks last week, namely 59. Three of his Wyandottes laid every day in the week. Their total now is 896. Pen No. 42, the "sour milk" pen of White Leghorns from Storrs Agricultural Station, have passed Francis F. Lincoln's pen of the same breed, and now hold second place in the total score made since the contest started. Their total is 752; this is 134 behind Barron's Wyandottes. Frank Tuttle's Barred Rocks that made the high score of 59 last week are still "on the job," with a record of 58 this week, giving them second place.

White P. Rocks from Albert T. Lenzen are third with a score of 57, and the "sour milk pen" of White Leghorns from Storrs Agriculture Station are fourth with a record of 55. Below is the week's score and the totals of the leading pens:

Profitable Plty., Massachusetts	44	439

At the egg-laying contest in Thorndale, Pa., Tom Barron's White Wyandottes lead all the other pens of any breed with a score of 467 eggs, and his White Leghorns hold second place with a total of 441. There are only five birds in a pen at this contest. The yards attached to each pen are an old heavy sod, and no green food had been fed other than that which the fowls could obtain when there was no snow on the ground. The egg yield under this treatment has exceeded that of any of the previous contests, and the mortality has been surprisingly small.

GEO. A. COSGROVE.

Eggs of Barron Leghorns.

Are the Barron eggs strictly white, uniform as to color and size? Why is it when I buy eggs from Leghorn farms that I sometimes get a chicken with grey feathers? J. L.

Mattituck, N. Y.

The Barron eggs are not uniform as to color or size. The pullets as a rule lay smaller eggs than the hens. This is usual in all flocks of any breed. Some of my Barron birds, both pullets and hens, lay very white eggs; others lay eggs slightly tinted with brown. I should say about 10 per cent. of the eggs are not clear white. Number 126 of the hens which laid 235 eggs in her pullet year, lays the brownest egg of any of them, and the very largest, really an extra large egg. She is a brawny large-boned, vigorous hen, and ought to breed powerful male birds, if one cared nothing about color of eggs.

If you get a "cnicken with gray feathers" from White Leghorn eggs bought for hatching, it is an indication that a rooster of some other breed has had a chance to mate with some of the hens; and it might have been two or three years ago that it happened; for the pullet resulting from that cross might not show any sign of it herself, but the foul feathers come ont in her daughter or granddaughter. GEO. A. COSGROVE.

Feed for Laying Hens and Henyard Muscovy Ducks.

1. What would be the best feed composition for laying fowls, and how much should be fed to about 20 hens, which have no yard or open lot privileges? 2. What would be proper, and how much, to feed about 15 Muscovy ducks, which like the chickens mentioned, above have no large space in which to roam about?

Trenton, N. J. I. V. B.

1. For a small flock it would be cheaper to buy the mash and scratch feeds put up by reputable houses. The aim in feeding both growing chicks and laying hens is to give them as large a variety of grains as possible. The scratch feeds should be mixed in litter to make the birds scratch. The mash may be placed in hoppers where the birds can get to it at any time. Give them all the scratch feed they will scratch for. Grit, shells and charcoal should be constantly before them, and sprouted oats or some other green food should be a regular article of diet.

2. Feed Muscovy ducks what they will eat of a mash composed of vegetables one part, cut clover or Alfalfa one part, beef scraps one part, low grade flour two parts, bran two parts, cornmeal three parts, or as many of these ingredients as you can. Add a pinch of salt to each mess, and once a week a little charcoal. Wet enough to make it crumbly. Keep grit and shells before them in boxes. Whole corn may be given for one meal a day, or more in cold weather when mash would freeze, but should not be given exclusively for a long period.

The Orange County Poultry House
(Patented)
Its use revolutionizes life in the country on a farm. As a general thing I personally feed and water all my hens, for all day, between 7.30 and 9 a. m. Between 4 and 5.30 p. m. I gather the eggs, and count it a poor day when I don't get from $15 to $20 worth. Some days recently they have laid 1 200 or better when market quotations were 26 cts. per doz. Some labor contrast between that and making $26 worth of milk a day. Catalogue and price list on application.
O. W. MAPES, - - Middletown, N. Y.

EGGS FOR HATCHING from Kulp's famous 242-egg strains. S. C. White Leghorn, S. C. Rhode Island Reds—$1.50 per 15; $5 per hundred. 50 Good Cockerels at $2 each.
H. A. BACON, Hillcrest Poultry Farm, Berwyn, Maryland

VALLEY VIEW FARM This is just to remind you that it is not too late to get hatching eggs from "Mapes The Hen Man's" Strain, S. C. W. Leghorns, as I have the use of my father's flock in connection with my own. Good utility eggs at $6 per 100 or special matings at $2 and $3 per 15 eggs. No order too small or too large, as I can fill orders of 1000 eggs not over three days old.
Son of "Mapes The Hen Man" JESSE E. MAPES Middletown, N. Y.

Hens With Colds.

I have 32 pullets in one house that are not doing very well; I only get from four to six eggs a day from them. My henhouse has a basement under it where it is warm for them to roost and lay. They seem to sneeze all the time. One hen some time ago had yellow cheesy stuff on her mouth, and could not eat, so I killed her. Do you think she had some contagious disease? I am feeding mixed grain mornings, corn on the cob about three o'clock, beets one day and fresh ground bone the next; dry mash before them all the time; a deep litter on the floor and change it once a month.
New York. M. J. K.

If your hens are sneezing and showing other evidences of colds there is something wrong with the housing conditions and not with the feed. I suspect that the basement where your hens roost is not only warm, but damp, and that the trouble has its origin here. Hens will do well at almost any temperature if the air is dry but they cannot stand dampness for any great length of time in their living quarters. If a basement is used, and very few basements are suitable for poultry, it should be so open that the air within cannot become saturated with moisture. A basement opening on one or more sides at the ground level may easily be kept dry enough for poultry, but no cellar is suitable. My suggestion is that you look to the ventilation of both house and basement and open both to such an extent as shall keep them dry, if you have to take a whole side out. M. B. D.

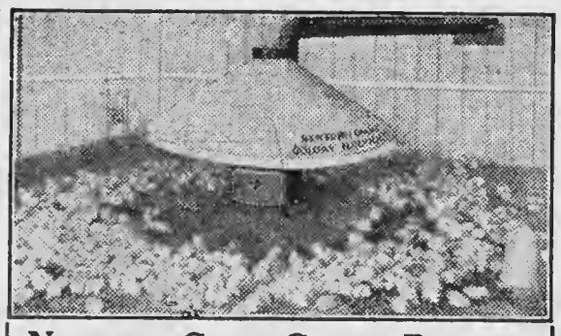
Ventilation for Henhouses.

I have a henhouse 18x160 feet; it was first built with loose floor overhead and straw on it, but is very cold, so am ceiling it with matched lumber on the sides and overhead with a door two feet wide in the center the whole length of the house, that we can have open or shut according to the weather. There are 32 windows 3x6 feet. Will cloth over half of the openings make sufficient ventilation? The house is located in a cold windy place. I have from 700 to 800 hens in the house. J. B. W.
New York.

If you have a two-foot opening in the front of the house for its entire length, you will hardly need any cloth windows for further ventilation. If your house is entirely closed, however, with no other means of ventilation than the windows, the opening of every other one of these, with a cloth screen to cover them in very cold, or very stormy, weather will probably admit air enough. A permanent cloth window is not a very satisfactory means of ventilation for a henhouse. Its pores soon become clogged with dust, and it is little better than a solid board screen. I prefer windows, guarded by poultry netting, which may be kept partially, or entirely open as the weather permits. Cloth screens upon hinged frames which may be lowered over such windows in very cold or stormy weather, and thus make it unnecessary to close them altogether, are valuable, however, and may be provided if thought best. With open windows in a very long house like yours the wind will sometimes sweep through it from one end to the other, and it is best to divide the house into comparatively short compartments by means of solid partitions of wood or cloth, making, say, four compartments in a 160-foot house. The amount of open window space needed can be best judged by the condition of the interior of the house; if the air within is so damp that moisture condenses upon the walls in cold weather, better ventilation must be provided. With such a house as yours, I think that I should depend upon open windows rather than cloth screens for ventilation, remembering that it matters comparatively little how cold the air within a henhouse is, if it is only dry.
M. B. D.

Eggs in Water Glass.

The use of water glass in preserving eggs is one of the simplest propositions connected with the chicken business, although a great deal of mystery has been developed about it. In several cases people have tried to sell a so-called new and mysterious method of preserving eggs, charging a good big price for it, which turned out to be nothing but our old friend water glass. You take one pound of water glass and then you take nine pounds of boiled water and mix the water glass thoroughly through it. This is put in a wooden bucket or stone crock. Take the egg as fresh as possible from the hen. Infertile eggs are much the best for the process. Take these fresh eggs, wipe them clean and put them into the water glass as soon as possible after they are laid. Keep them down in the liquid by a cover or weight and simply leave them alone in this liquid until you want to take them out and use them. They will keep reasonably well in this liquid for six months. You must have absolutely fresh and clean eggs. There would be no use whatever in putting stale eggs into this water glass solution, for it could not bring a dead egg to life or improve its quality. All the water glass can possibly do is to hold the egg in about the condition it was when it went into the solution, and when taken out of the water glass it should be used as quickly as possible.



NEWTOWN GIANT COLONY BROODER
Coal-burning. Self-regulating
Simple, safe, serviceable. Efficient, economical. Saves time, labor, fuel. Makes success sure. Heartily endorsed by practical poultrymen.

Save Your Chicks From Lice

Safe—effective—quick in its action. Sprinkle it on the roosts—in the cracks—in the dust bath—on the young chicks—use it on lousy stock—it's a sure lice destroyer.

DR. HESS Instant Louse Killer

kills lice on poultry and farm stock, also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Sold in sifting-top cans—guaranteed—1 lb. 25c; 3 lbs. 60c (except in Canada and the far West). If not at your dealer's, write us.
DR. HESS & CLARK, Ashland, Ohio.

GERMOZONE'S Big Value

is not so much in its great efficiency as a remedy for roup, canker, chicken pox and other diseases of poultry, but it is the greatest bowel regulator in the world for either poultry or stock (including pet stock), counteracting, especially, bowel troubles due to musty, spoiled or improper food. With man, fowls or animals, regular bowels means health. Continued irregularity means some sickness, difficult to cure if not fatal. Thousands give Germozone regularly twice a week to chickens, young and old, at the same time having it ever handy as a ready remedy for other diseases. Sold by dealers or postpaid. One size only, 50 cents.

More Money From Your Hens!

Do You Want to Learn How?

WE are in a position to help you with your poultry. The best poultry writers in the country are ready to answer your questions, and will direct you step by step in the development and care of your flock. Through their help you may become an expert yourself, if you will follow their suggestions and take up a line of reading in connection with your practical work in the henyard. This service is free to all subscribers and their families. Make frequent use of it, and begin at any time.

A POULTRY-BREEDING PROBLEM.

There is certainly much food for thought in the egg-laying contest at Storrs, Conn. Is there any known way of accounting for the wide discrepancy in egg yield? It must be that most, if not all, of the exhibitors have to a considerable extent followed the prescribed ration for egg yield, and yet with what results? Probably as variable as you would find on 82 farms selected at random where no particular attention had been paid to scientific feeding. Can you diagnose this situation? Here is an instance of our farm. As to myself I am a back-to-the-lander, been back for eight years. I started in with enthusiasm to raise chickens, but my losses were heavy during brooding time, having a lot of fruit to look after, and being alone I gave it up. I have raised a few chickens since but with no particular success till this year. The breed I am struggling with is Barred Plumouth Rocks. This year I got 14 pullets and they are a splendid looking lot. They with four of the hens are my layers; commenced laying Thanksgiving Day. Since Christmas they have laid over 50 per cent. The week ending January 23, they laid 66 eggs, exactly what 250 White Leghorns laid at Storrs that week, three and two-thirds eggs per hen, which was nearly equal to the second best pen at Storrs, viz. three and seven-tenths per hen, and exceeded by Barron's champions only. I have of course fed them fairly well, but no green bone, meat scrap nor meat meal, and have had no thought of competing with anyone. In fact I was so busy with fruit and farm work up to December 1 that they got mighty little attention. Fed them mostly wheat at night, some corn; since I shut them up have fed ground oats and bran, with some scratch feed in morning; cabbage or apples at noon, considerable milk, wheat and some corn at night. They have been up with the leaders right along. One week there were four pens ahead of them. I suppose the answer in my case is that I accidentally got hold of just the right cockerel. Would that I could trace him back! In previous years I have had very few eggs before March. There surely is some way to improve these laggards, as is shown in my case, but what is it? I am puzzled now as to next move. It hardly seems best to keep that cock another year with his offspring—too much inbreeding. But where can I get another one to carry on the good work? Must I simply take my chances? It does seem as if this condition should be followed up and tried out. F. E. B.

Ulster Co., N. Y.

I think you are too previous in comparing results at home and at Storrs. The 20 below zero cold snap, with wind 50 miles an hour, in January, cut down the egg yield badly. Already it is coming right up to high-water mark, unless the second cold snap to-day, with 17 below zero, gives another drop to the eggs. Many of the birds at Storrs were far from mature when they arrived. Some of the breeders selected, purposely as we know, late hatched pullets that would not be expected to begin to lay before January fist, but pullets that would likely lay right through the season late into October. That they were right, some of them, is shown by the eggs that are now being laid. Those fully matured pullets that were laying when they came, molted, many of them, and dropped way down in egg yield.

As to your own problem. Cannot you buy a brother to the male that has done you so much good? Mate him to the pullets, and mate the cock to the same hens he was with last year. In other words, retain last season's mating, and add a new one of your pullets and a cock that is not closely related. This will be your best plan. If impossible to buy the male that I suggest, perhaps you can find a cockerel that is of the same line of breeding. For your purpose I would not urge any inbreeding if you can avoid it. N. W. SANBORN.

Massachusetts.

Care of Duck Eggs; Runners.

If duck eggs are set under a hen leave the entire care of them to the hen, provided she is a good sitter. In an incubator treat them practically as you would hens' eggs. Maintain the proper temperature, turn daily and sprinkle with warm water towards the end of incubation.

When the ducklings are 24 hours old give them bread crumbs and rolled oats slightly moistened, with a little fine grit. Give a little four or five times a day if possible. After two days add bran and cornmeal in increasing quantities. In a week begin to add cheap flour and omit oats and crumbs. Gradually work up to the following for the growing and laying food: Vegetables one part, green stuff one part, beef scraps one part, low-grade flour two parts, bran two parts, cornmeal three parts. Add grit to all feed, fine to the little fellows, coarser to the adults. When they are full grown grit and oyster shells may be put in boxes and they will help themselves. A pinch of salt should be put in all mash, and once a week a little ground charcoal. Adult ducks may be given one feed a day of whole corn. This is especially good in cold weather, and when they are laying.

There are three varieties of Indian Runners, the English Pencilled, the American Fawn and White, and the White. The friends of each of the colored varieties claim that their birds are the only original. If you would be sure of getting the real thing consult the awards of premiums at the great poultry shows. The judges at such shows would not give premiums to birds that were badly disqualified. W. H. HUSE.

Cutting Out the Drones.

On page 280 Mrs. R. B. asks if there has been any way devised in arranging nests, other than trap-nests, whereby the laying hens could be separated from the non-layers. One way would be to divide the chicken house by a partition of wire netting, with roosts in both parts, and a row of nests placed on the floor of the coop under the partition. Each nest should be cut down at both ends, so that a hen could enter from one side, and come off the nest from the other side. A board should cover the top of the row of nests, and each nest should have vertical cleats at both entrances, so that a short piece of board could be slipped in to close the entrance. Put all the hens in one side and close all the nests in the other pen. When a hen is on the nest, close the nest on the side from which she entered and open the nest on the opposite side. This will cull out all the drones in a week, and these may be removed from the coop, and the operation repeated to cull out the poor layers.

New York. CHAS. A. WOOD.

Pigeon Cove, Mass.

Brushing Off Lamp Wicks.

Several years ago THE R. N.-Y. had an item in regard to using an old brush (an old toothbrush is fine) for rubbing the charred part from the incubator and brooder lamps, instead of using shears for trimming. We thought it a good idea, and ever since have used an old toothbrush to clean the wicks of the incubator lamps, and it certainly is much better than trimming. The wick is kept cleaned much easier, is always smooth and even, and no chance for some little thread to stick up and make a smoke. The wick itself lasts twice as long; this of itself is not of much consequence, but the changing of an old wick for a new one makes one's fingers greasy and oily, and that is a disagreeable feature. Using shears to cut the lamp wick—even if very sharp—often leaves a point on one end, and this smokes during the day when it gets charred, or a thread is left sticking up, which is overlooked in the semi-darkness of the incubator cellar, and this is sure to make trouble. With the brush to clean the wick, that is left smooth and bright as well as even, and easier to regulate the flame.

I have often wondered in looking over the incubator catalogues that no mention is ever made of the use of a brush for trimming the lamp, and so would like to bring its use to the many readers of THE R. N.-Y. who are interested in and are using incubators. HORACE B. PARKER.

PUBLISHER'S DESK

The last chapter in the Sterling Debenture Corporation which swindled investors in the Oxford Linen Mills Company, Massachusetts, out of $10,000,000, was written last week. Seven of the officials were found guilty of using the mails to defraud, after a trial that lasted about a month. Three of them were sentenced to serve six years each in Atlanta Penitentiary. These were the former president, George H. Middlebrook, reported to be worth $1,000,000, Frank W. Schumaker, secretary, and Harry H. Platt, promoter. The others got three years each. In passing sentence Judge Anderson read the crooks of the country a wholesome warning. He said:

The financial gentlemen of New York who have an itching palm and who try to defraud the investors of this country must be taught a lesson. These men made millions out of the poor investors of this country and I cannot lose sight of that fact. What is the poor nurse from Utah who invested all her savings in these men's schemes to do? What recourse has she?

It is unfortunate that these schemers cannot be prevented from robbing poor people of their savings. Everyone at all familiar with the gold brick game in stock certificates knew from the first that the money put into these schemes would be a total loss to the people who parted with it. Yet the Government felt it could do nothing until the record of the ...bery was complete. Formerly some ...ese schemes were nipped in the bud by the issue of "fraud orders" against the promoters by the postoffice, but some of our humane law-makers including now Secretary Redfield, through their tender sympathies for crooks, succeeded in doing away with the "fraud order." Since then the schemers have had a free field. An occasional bunch like these gets a few years, but there is precious little comfort even in that to the poor people who lose the savings of a lifetime. It is said that the present Administration is going back to the "fraud order." The sooner the better.

Please record me as a charter member of the Fake Detection Association under Dr. Ulman. O. H. W.
Ohio.

All right, the record is made. The association is growing. There is no fee, but members pledge themselves not to subscribe for any paper that prints fake or deceptive advertising and refuse to receive such publications into the home.

The Hammonton, N. J., Strout agent must have forgotten his early lesson to abhor the business of trying to down his neighbor. What can he do more effectively to down them than to help the Strouts sell their farms for from 10 to 70 per cent. above their value?

If I believed his estimate of farm papers, I would not subscribe for them. If the business of a farm paper is not to warn its subscribers against frauds and crooks, as well as to disseminate the latest news, I would like to have the Strout agent tell me what it is for. Don't worry over the loss of his name from your subscription list. Here are three others to take his place. C. T. S.
New York.

Not worry? Bless your soul! The publisher who would not rejoice in his heart over a letter of that kind would be a cold proposition indeed. There are men and publishers who persist in saying that the plain farmer is ungrateful and that he does not reward those who serve him. I think if they were entirely truthful and honest they would admit that the plain farmer in the past has, like the rest of us, been too willing to reward those who pretended to serve him. If he has learned his lesson now and discriminates between those who serve and those who pretend to serve, so much the better for him. No farm paper in the country has a larger clientele of prosperous high-class farmers, but we confess to a keener concern for the interest of the plain working farmer. The former is pretty well able to take care of himself. We like to help the man who most needs assistance. So far from complaining of want of gratitude from them, we have frequent reasons to feel that they give us more credit than we deserve for the little service we can do them. How are you going to beat the gratitude that sends three names to take the place of one lost in a defense of all?

The Quaker Valley Manufacturing Company, Aurora, Ill., needs the attention of Publishers' Desk. They advertise to send free a so-called Klara Kling clothespin bag. When I wrote for it, they sent with it inducements to accept one of their stand-up scrubbers, which they also agree to send free to advertise in our neighborhood. They send the scrubber, or mop, on a 10-days' trial; and then demand $1.62 remittance for it. I have even offered to return it, but they now refuse to accept it, and threaten suit to collect. J. P. S.
New York.

The literature of this concern is very illuminating. Among other fakes they go to the extent of calling the victim a member of Quaker Valley Coöperative Community. Here is one of their letters:

Records of the United States Realization and Collection Bureau, who have been looking into the case for us, show that the standup scrubber we shipped you was promptly delivered by parcel post, and they are anxious to place it on docket for action in the courts. Their inspector has made his report. The amount involved is trivial—only $1.62—but that will make no difference. It must be paid within a week or we shall instruct the United States R. and C. Bureau to proceed. We very much regret the necessity for this action.

The Collection Bureau is probably one of their own employes. There is not the slightest danger that suit will be brought on any such scheme. It is simply an attempt to browbeat the victim out of $1.62. This is considerable space to give to such a petty fake, but such schemes often amount to a great deal in the aggregate. It is another lesson on gold bricks. It is the something-for-nothing trick.

We shipped A. G. Krispien, Jr., 433 Seventh St., West New York, N. J., one crate of eggs, which the express company claims to have delivered to him. We have been unable to get any word from him. If you can help me I will be very grateful. M. A. T.
New York.

Our investigation proved that Mr. Krispien had left the above address some time ago, and we were unable to get any trace of him. Now that New York City merchants are licensed and bonded, New Jersey is pretty sure to get those who cannot secure license here.

The organization of a local land bank will benefit every individual and every industry in the community in which it is located. It will benefit the boy or girl, man or woman with a little savings by furnishing a safe investment and a sure and safe earning capacity from the day the money is invested to the day it is withdrawn. It will benefit the farmer by affording a safe and profitable plan for investment if he has funds and by furnishing a loan on his property on favorable terms if he wants to borrow. It will favor the banker by the deposit of accumulated small savings which otherwise would never find their way to a bank. It will help the tradesman by furnishing capital for production and enterprise. It will benefit the whole community by encouraging thrift, stimulating industry and encouraging permanent improvement and investments. The community that creates attractive investments for its own capital and attracts capital from a distance is bound to be enterprising and prosperous.

In the past the improvident kept their money idle in the home, or invested it in tempting gold bricks. The more progressive deposited it in the local bank without interest and it went to Wall Street to be used in stock gambling. Now you have an opportunity to use it at home in the industries of your own community.

The central land bank will soon be organized. Your community ought to be represented in it. The State is ready to send men to tell you all about it, and to help you make the local organization, if you decide after hearing him that you are ready to go ahead, and if he finds you have the elements of success in your neighborhood. Talk it up in your clubs and homes; and if you want definite information ask for it. J. J. D.

MRS. DASHAHEAD (visiting at the vicarage): "What beautiful buttons you are sewing on your husband's waistcoat! Do you know, my husband once had some just like them?" The Vicar's Wife: "Yes, we found them each Sunday in the collection bag."—Melbourne Leader.

MORE MONEY-EASY WORK-BETTER STOCK

Get All the Wool from your sheep. You lose $1 on every six you shear by the old method. 15 to 20c more in wool from every sheep is worth considering. Why not make more money?

Horses and Mules Should be Clipped in the spring. Remove the heavy winter coat which holds the wet sweat and dirt. They will do more work for you and be better in every way.

STEWART'S No. 9 BALL-BEARING SHEARING MACHINE

PRICE $11.50

will get you longer, better and more wool and take it off quickly and smoothly in one unbroken blanket. To shear with the Stewart Machine seems like play to those who have labored with hand shears in the old, hard, sweaty way. You don't have the same swollen aching wrists. You don't sear and disfigure your sheep with uneven shearing and spoil the wool with second cuts as you used to do. The Stewart saves all that and easily and quickly gets you more and better wool. **Get one from your dealer,** or send us $2.00 and we will ship C. O. D. for balance. Money back if not pleased.

THE STEWART BALL-BEARING CLIPPING MACHINE

can be used for clipping horses, mules and cows without change. It's the easiest to turn, does the fastest work, stays sharp longer and is the most durable. **Get one from your dealer,** or send us $2.00 and we will ship C.O.D. for the balance. Your money back if you are not well pleased.

PRICE $7.50

HUBBARD'S BONE BASE CONNECTICUT FERTILIZERS

640 Cabbages

in one day—and in a bad year for cabbages. HUBBARD'S BONE-BASE FERTILIZERS made this possible. The following letter is self-explanatory.

Westwood, Mass. Nov. 19, 1913.
The Rogers & Hubbard Co., Middletown, Conn.
Gentlemen: I know you always like to hear of a good crop raised by the use of Hubbard's "Bone-Base" Fertilizers. Well, I have it in a piece of Cabbage and can safely say that it is the best I have ever had in 40 years, and it has been one of the poorest years for Cabbages for years. At that, I cut 640 one day; the average would weigh about 11 pounds each. Average weight per barrel 120-135 pounds. They were not extra large, but of great weight. I weighed one Savoy Cabbage that weighed 14¼ pounds.
Yours truly, LYMAN FISHER

RETAIL PRICES AT NEW YORK.

Those are not the highest or lowest current prices, but are fairly representative of what the majority of New York consumers pay:

Eggs, fancy white, doz	33	@ 38
Mixed colors, new laid	28	@ 30
Ordinary grades	23	@ 25
Butter, fancy prints, lb	33	@ 34
Tub, choice	27	@ 29
Chickens, roasting, lb	30	@ 32
Fowls	25	@ 28
Turkeys	28	@ 32

WOOL.

Business at Boston has been rather dull mainly because of the scarcity of certain grades of fine wool. New scoured wool from the Southwest has brought up to 56 cents. Fleeces of Ohio quarter blood have brought 24½. The new clip from the ranches of Montana, Wyoming, Utah and Idaho is selling at 18 to 19 cents, and a small quantity of New York fleeces at 17 to 18 cents. Many farmers in New York and Michigan are holding for 20 cents or upwards.

Government Wheat Report.

The area of Winter wheat planted in this country was 36,506,000 acres. The condition at the opening of Spring was 95.6 per cent. of normal, which is 11.5 better than for the last 10 years. The estimated yield on this basis is 551,000,000 bushels.

The average condition of Winter rye is 91.3 per cent., which is three per cent. better than last year. The area in rye is 2,702,000 acres.

The Winter wheat outlook by percentages in some leading States is as follows: Oregon, 102; Utah, 99; Illinois, Missouri and Idaho, 98; Indiana, Tennesee, Oklahoma and Washington, 97; Ohio, Kansas and Kentucky, 96; New York, Virginia, Iowa, Mississippi, Arkansas, Arizona, Nevada and California, 95; West Virginia, Wyoming, Colorado and New Mexico, 94; Pennsylvania, Maryland, Nebraska, Alabama and Montana, 93; North Carolina, Michigan and Texas, 92; New Jersey, Delaware and Georgia, 91.

Plowing has been done for oats and corn. Wheat is looking just fair; not a large acreage was sown last Fall. Grass is starting nicely. Feed (rough forage) is pretty well picked up through here. Hay $8 to $10; clover seed $7.50 to $8; corn 95 per cwt.; oats 37 per bushel; wheat 92; country butter 25 to 28; butter fat 27½; eggs 16. Cows are high, $60 to $100, not many changing hand; good horses in good demand, $150 to $250. G. W. H.

Elida, O.

First Feed for Chicks.

I have just been reading Mrs. H. E. Matthews' very able article on the brooding of chicks, page 242. She speaks of the first feed not to be given until the chick is at least 48 hours old. I would like to emphasize this very strongly. Let me state my experience:

Three years ago I bought 450 baby chicks. I had two colony-house gasoline heated brooders in which they were placed. I began feeding an approved ration and tried to give them the best of care. Still when about three weeks old some of them began to droop. Their wings hung down, their eyes looked watery, they suffered with a diarrhœa, pasted up behind, and the final act was to lie down and die. I studied books and poultry papers and bulletins galore, and reached the conclusion that it was the dread white diarrhœa, and I was pretty blue thinking I had gotten this dreaded disease on my farm. I gave the living ones the best care I could, and the next year used some of this flock for breeders. I purchased an incubator and hatched my own chicks. These were placed in the brooder which had been cleaned and disinfected thoroughly. At the end of two or three weeks those which were of the first hatch began to "dump" as in the previous year. Now I was sure it was white diarrhœa and I was bluer than ever. About this time I read an article in a poultry journal on the feeding of chicks. The writer claimed they should not be fed until from 48 to 60 hours old. "If fed before," he said, "the egg yolk would not be absorbed but would remain within the chick and appear like a piece of hard cheese. The symptoms were very nearly like those of white diarrhœa and in nearly every case death would result." I started for the brooder at once and found 14 dead or dying chicks. These were taken to the house and after killing the dying ones a post mortem examination was performed on the entire lot.

Twelve out of the 14 showed unabsorbed egg yolk varying in size from a pea to a large marble. Others examined later showed the same results. The lesson was costly but I had learned it well, and so applied it on the next two hatches that same year. I did not feed until the chicks were from 50 to 60 hours old, and as a result I lost very few from bowel trouble. Last year I followed the same plan with good results, so I adopted the rule "*never feed chcks until at least 50 hours old*, with emphasis on *never and 50 hours*.

New York. C. T. STONE.

There are many causes for the bowel troubles. Chicks in transit sometimes get chilled causing a slow assimilation of the yolk. A wet chick just out of the shell dropping to a cooler nursery below may get a chill. Bowel trouble is sure to follow about the third week. Faulty incubation may, and probably does cause most of the trouble. Incubator chicks, if eggs have not been aired and cooled down properly, are apt to have more unabsorbed yolk than chicks hatched under a hen. It is claimed that the unabsorbed yolk affords a suitable culture medium for the bacteria resulting in fermentation causing diarrhœa. We place chicks in brooder when 24 hours old. Give water first and scatter grit and cracked grains for them to pick at. The hard grains at this time give the little digestive organs activity. The rich mashes which are easily digested are wrong at this age, and are usually fed by most people. So a safe rule is to say "48 hours for the first feed." In fact they will eat but little before that time and the first they eat should be cracked grains and grit.

H. E. MATTHEWS.

Egg-eating Hens.

Is there anything that will cure hens of eating eggs? I have killed some. Some of them are nice birds and I would like to keep them if I could break them. We blow eggs and fill the shell with the following mixture but this does not last long, neither will it do any good in some of the pens: Equal parts red pepper and mustard, wet with equal parts kerosene and hot water. It seems as though there must be something lacking in their food. We have a regular formula to feed by. It includes grit, oyster shell, charcoal and animal meal; have fed ground bone during the Winter. H. H. W.

Egg eating is apparently one of the vices due to close confinement, and idleness. Filing the beak, and stuffing egg shells with mustard, sometimes breaks the practice up, and as often fails. If hens can be given their liberty, they will often cease to eat their eggs, but if they cannot, their eggs must be removed before they break them. With one flock, the writer was compelled to arrange a battery of nests with a false bottom slanted in such a way that the eggs when laid immediately rolled out of reach of the hens. This false bottom was covered with carpet and saved the eggs. For several years no trouble of this kind has been experienced and broken eggs have been thrown to the hens. If any danger is anticipated, the nests should be darkened and the entrances so arranged that idle hens will not stand and peck at the contents of the nests. By a little watchfulness the offending fowls may sometimes be detected and removed from the flock. M. B. D.

Brooding Chicks Indoors.

I am planning to raise some chickens for layers when prices are good, and would like your advice. I have a small room, regular bathroom size, unused, heated by hot air, window about 2½x3 feet. I thought of getting 50 or 100 day-old chicks, Leghorn, in March, and after putting roofing paper on floor and base to put the litter on, turn the chicks into this room. Would a hover be necessary, or will the room do as it is? I feel as if I can give them better care in doors than out. Will March-hatched chicks be laying in November, December and January, or will they just be moulting? M. C. A.

Your plan will work all right for about three weeks, when you will find it necessary to get the chicks out upon the ground. If kept housed in a warm room longer than from two to three weeks, chicks begin to show leg weakness and other symptoms of lowered vitality, and unless given access to the open air and to mother earth, will dwindle and die. Your chicks would need a hover at night in such a room, but an open bran sack laid over them as they huddle together in the litter would probably be sufficient. Your greatest danger would lie in keeping them too warm. March hatched chicks should lay in October, but if hatched too early in that month and forced to early maturity, are apt to lay for a few weeks and then moult. M. B. D.

AUNT Lindy had brought around her three grandchildren for her mistress to see. The three little darkies, in calico smocks, stood squirming in line while Lindy proudly surveyed them. "What are their names, Lindy?" her mistress asked. "Dey's name' after flowers, ma'am. Ah name' 'em. De bigges' one's name' Gladiola. De nex' one, she name' Heliotrope." "Those are very pretty," her mistress said. "What is the littlest one named?" "She name' Artulficial, ma'am."—New Orleans Picayune.

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

DO YOU NEED FARM HELP

We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. Ours is a philanthropic organization and we make no charge to employer or employee. Our object is the encouragement of farming among Jews. **THE JEWISH AGRICULTURAL SOCIETY, 176 Second Avenue, New York City.**

FARMER'S SECURITY BUREAU, NEW YORK
Help, Farms, Estates, Institutions. Write. Phone 6486 Cortlandt. Agency Maintained by qualifications, men placed. Have no branch. Sidney Sullivan, Expert, 99 Nassau

Laborers Supplied Free—We have many able-bodied men, who have worked as laborers, etc., anxious to learn farm work. $18 to $25 a month. **C. K. BLATCHLY, United Charities Bldg., 105 E. 22nd St., New York City**

WE CAN SUPPLY
Women Help for Farm Families
At Nominal Wages and Good Home—No charge.
GUILD OF THE INFANT SAVIOUR
105 E. 22d St. - - - New York City

Subscribers' Exchange

FOR SALE—Potatoes and Maple Syrup. JOB McCARTY, Forksville, Pa.

ONE SIMPLEX BROODER STOVE, good order, $18. FRANK A. MILLER, Pottersville, N. J.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

YOUNG AMERICAN, 22, healthy, wants farm job; little experience; moderate salary. X. Y. Z., care R. N.-Y., 333 West 30th St., New York.

REFINED, married man, with small capital, as a working partner on a well-equipped paying farm; two dwellings; climate unsurpassed. GREEN MOUNTAIN FARM, Newfane, Vt.

TRAINED NURSES—Hackensack Hospital Training School has vacancies; applicants healthy, good character; age 20 to 30; two years' course. Apply SUPT. MARY J. STONE, R. N., Hackensack Hospital, N. J.

YOUNG, STRONG HIGH-SCHOOL GRADUATE wishes position on farm this summer; understands milking, haying, cultivating, etc.; worked on farm the two previous summers. MARTIN GROEPLER, Yonkers, N. Y.

GARDENER WANTED — Capable of taking charge of small hotel garden; high wages; send particulars regarding age, experience, references, etc. GEORGE T. SPERRY, Guilford, Conn.

WANTED—Position as foreman, by married farmer, one child; good, practical experience; all branches of farming; good references. Address V. F. L., care R. N.-Y., 333 West 30th St., New York.

AMBITIOUS, trustworthy married man of 34, extensive experience, desires position where intelligence and industry will be appreciated. HILL, care R. N.-Y., 333 West 30th St. New York.

POULTRYMAN WISHES POSITION—Married; thoroughly competent; 15 years' experience; able to manage large plant; Cornell training; will build up a plant or take entire responsibility of existing plant. POULTRYMAN, Box 12, Manorville, L. I.

YOUNG MARRIED COUPLE (American), want work on farm; man as farm hand; no experience, but interested and willing; wife for housework; reference given; accept position May 1; state wages. Address ANDREW J. GLYNN, 325 West 17th St., New York City.

FIRST-CLASS HERDSMAN AND DAIRYMAN open for engagement at once; American, 40 years; single; lifetime experience with cattle; a Jersey or Guernsey herd preferred; best of references; state wages in first letter. Address HERDSMAN, 283 West 17th St., New York City.

A STEADY POSITION, with good opportunity for advancement, is open for farm-bred young man. Must be a typewriter and a good correspondent. Write fully as to age, experience, education and salary expected. Address STEADY POSITION, care The R. N.-Y., 333 West 30th St., New York.

FOR SALE—Hydraulic Cider Mill complete; in fine working order. F. L. SHELDON, Troy, N. Y. R. F. D. No. 1.

PURCHASE ALFALFA HAY direct of the producer and save money. P. P. ERKENBECK, Fayetteville, N. Y.

GET DOUBLE FOR CREAM—At half first cost, ice cream outfit; will instruct purchaser. FRED. W. PROCTOR, North Brookfield, Mass.

93 ACRES and 12 ACRES—Two acres in grapes. Inquire N. M. KISTLER, Emporia, Va.

255-ACRE FARM FOR SALE at a sacrifice; stock and tools included; write for particulars. C. E. BONTON, Roxbury, N. Y.

250-ACRE potato and stock farm, $50 an acre; or for rent, $500 per year. JAMIESON, White Building, Buffalo, N. Y.

WANTED TO RENT—A small farm in northern New Jersey; will purchase if suited. R. O'B., care R. N.-Y., 333 West 30th St., New York.

FOR SALE—80-acre irrigated farm in Idaho fruit belt, close to electric car; telephone and R. F. D.; live stock, machinery; easy payments. Address owner, G. PRIMBS, Caldwell, Idaho.

FRUIT, TRUCK, POULTRY FARM FOR SALE—36 acres, excellent location and market; good buildings; all kinds fruit; strong soil; with or without stock, etc.; buy direct, saving commission. HOMER TWEED, Quakertown, Pa.

FOR SALE—125-acre highly improved Blue grass farm near Darlington, Harford Co., Md.; 14-room house in large grove; large stable; fine orchard; in best of repair. "ALTAVISTA FARM," Darlington, Harford Co., Md.

MODEL POULTRY FARM—Successful business proposition, fully equipped with thoroughbred stock; 35 acres; capacity 3,000; large dwelling, mile from railroad; profits will return 20 per cent. on investment; $15,000, part cash. BOX 256, Beverly, N. J.

FOR SALE—Five miles from Traverse City, Mich., 120 acres; 20 acres timber; good house and barn; water; orchard; ⅛ mile to school; telephone; R. F. D.; $50 per acre; easy payments; no trade. P. O. BOX 142, Traverse City, Michigan.

108 ACRES irrigated farm, 50 miles above Brownsville, Texas, on Rio Grande River; own pump; 30 acres in Alfalfa; well improved; $150 per acre; easy terms. Address owner, M. HOLLOWAY, Box 122, Donna, Hidalgo Co., Tex.

WILL SELL OR EXCHANGE for fruit farm in Virginia or farm in Ohio, 33-acre tract, ¼ mile from Homestead, Ga.; land fronts Atlantic Coast Line R.R.; is within five miles of Waycross, Ga. Also 196-acre tract for sale 1 mile from Homestead; both tracts suited for pecans or any other crop. G. R., care R. N.-Y., 333 West 30th St., New York.

WANTED—From June to October 1st a summer cottage in the mountains—White Mountains, Adirondacks, Berkshires or Otsego section, with altitude. Want modern house, with bath and at least five bedrooms and garage, and good roads. State conditions fully and rental. Address SUMMER HOME, care The R. N.-Y., 333 West 30th St., New York.

30 Day Free Road Test

Write Tonight For It

200,000 Men Have Found It Saved Them $25.00 to $40.00—*It Can Save as Much for You*

It's the greatest book Phelps has ever issued. It shows more buggy styles than any other vehicle book Phelps has ever given free to the public. *It shows why and how thousands are paying far too much money for buggies.*

It tells you all that Phelps has learned in all his 14 years in the vehicle business. Gives you "inside" information. Posts you on the tricks of the trade. Informs you why the local dealer must compel you to pay a jobber's profit—a traveling salesman's high expenses and salary—and a local dealer's necessarily large profit every time you buy a buggy from him.

H. C. PHELPS, *President*

Once you possess this book, you'll know as much—if not more—about vehicles as your local dealer. You will *know* 1914 styles. And you will *know* genuine vehicle *value*. Once you possess this book no one on earth will ever be able to fool you on buggy worth. **125 Different Models of 1914 Styles of**

Split Hickory Vehicles

are shown in this big, handsome book—which is yours just for the asking. Surreys—Carriages—Phaetons—Spring Wagons—Made to Order Models—High Grade Harness.

All Phelps makes—all he sells direct at low factory prices—are here pictured, interestingly described and *guaranteed*. That is the beauty of dealing with Phelps. You can't lose. You must gain. You must be thoroughly, completely, enthusiastically pleased or Phelps refunds your money.

Phelps Sells All His Vehicles On 30 Days' Road Test and Guarantees Every One for 2 Years

But Phelps really runs no risk in offering this Free 30 Days' Road Test—in making this 2-Year Guarantee. Every Phelps Buggy is made of genuine Second-Growth Hickory—*split*, not sawed. 200,000 pleased owners everywhere—hundreds of them in your own section—declare they are the best vehicles made. And every one of them bought their buggy and saved from $25.00 to $40.00, depending on style purchased, after they got Phelps' Book.

Just Write Your Name and Address on a Postal and Send It to Phelps—He Will Pay the Postage on the Big Book

He wants you to have this book. Sending of it places you under no obligation. Get the book—and then buy your buggy where you choose. *But get the facts*. You owe that much to your pocketbook. Follow the example of over 200,000 other men. And do it now—tonight—right while this ad and this offer are in your mind. *Get that book*. Address—

COMMERCIAL HOME CANNING OF FRUITS AND VEGETABLES.

PART I.

STERILIZATION.—The canning of fruits and vegetables on the farm is one of the greatest problems to be solved, in order that we let nothing go to waste. Great progress has been made in the last 25 years, and if we could look ahead 25 more, we would be surprised to see the improvement yet to come. Millions of dollars are lost every year throughout the fruit and vegetable growing sections, on account of stuff going to waste which could be saved if properly canned. This loss is so large that it would bankrupt any other industry in a very short time. There are few who do not share this loss, and fewer yet who could not increase the earning capacity of their farms, by sterilizing the product of their gardens and orchards, so as to keep indefinitely, and be sold at the most opportune time. The large canning factories scattered throughout the country afford but little relief against this loss, as only a few farmers who live close by can avail themselves of this convenience. The only solution is the home canning of fruits and vegetables by the grower on a smaller scale in the proper manner, so as to be readily sold at a popular price.

EARLY EFFORTS.—In 1825 Thos. Kemsett and Ezra Daggett obtained patents from the Government for putting up canned goods in hermetically sealed cans. The operation was somewhat crude, but the principle was the same then as now, viz.: to place the goods in airtight receptacles and subject them to heat sufficient to kill all ferment germs. Since that time scientists have studied very carefully into the causes that decay and spoil fruit and vegetables. The process of sterilization has been largely confined to the commercial canning industry, and the result has been that the United States is, or was, until recently far behind in the art of home canning. It seems that the business has been rather clouded in mystery to the rank and file, but the process of sterilization is a very simple one and easily understood by anyone of ordinary intelligence.

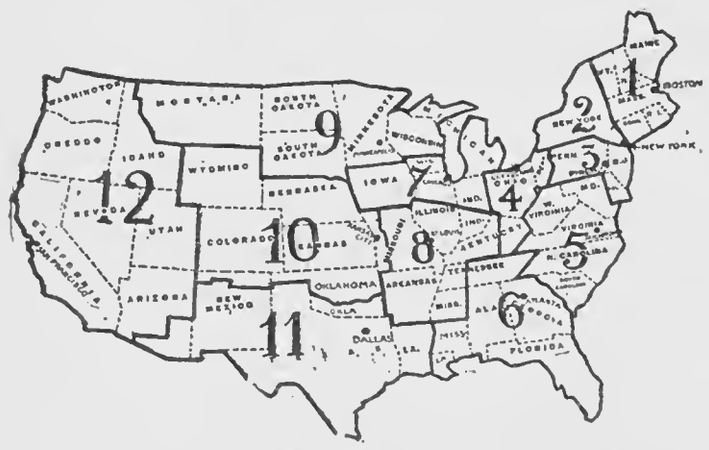
PRINCIPLE INVOLVED.—In European countries there are large quantities of canned goods put up at home, or by those who raise the fruit and vegetables, and the idea is fast becoming a fact in this country. There is really no secret about the art of canning. If so, it can be explained in two words—steam pressure. It is simply to place the fruit or vegetables in a jar or can that in some way may be tightly sealed to exclude the air, and then subjected to a sufficiently high degree of heat to kill all spores and ferment germs, and the goods will keep indefinitely. Applying intense heat the required time will kill every germ known to science, and if the contents of the container, no matter of what it is made, are subjected to this degree of heat, they will be properly sterilized, and there need be no fear but what they will keep, unless exposed in some way to the outside air.

THE MODEL FOR ALL INCUBATORS. Fig. 245.

HEAT AND DENSITY.—If the article so treated is kept away from the germ-laden air, fermentation will never occur. One fact has not been generally known, and that is, that the temperature of pure water in open kettles will never rise above 212 degrees no matter how hot the fire, nor how long applied. The water will remain at 212 degrees, unless altitude should make a difference, or if sugar is added in sufficient quantities the syrup will rise to 240 degrees because the sugar makes the water more dense. This is really one of the secrets of the canning business, and is mainly the reason why housekeepers are more successful in putting up fruit and preserves in syrup than in plain water. Now if you confine the water in a steamtight boiler the heat will immediately rise to a much higher degree, and this is the reason why professional canners can put up their goods without the addition of sugar, because they are equipped with steamtight boilers in which the goods can be subjected to steam pressure, which makes it just as easy to put up goods without preservatives as with preservatives. Therein lies the entire success in sterilizing food stuffs of any description so they will keep indefinitely. Cooking by steam under pressure spells success in the canning business. Sufficient heat and airtight cans do the trick. And here is where so many of the so-called canning outfits are impracticable, because they are nothing but open kettles, and are no better than a common washboiler, only being of different shape and described as canning outfits, and so mislead those who do not know the principles of sterilization. Corn, peas, beans, pumpkins, etc., require steam pressure. It is also a safer

process for sterilizing fruit, especially such as have large pits, as it is almost impossible to kill the germs located on the inside of such fruits without steam pressure.

ACIDS AND FERMENT GERMS.—We now come to another phase of the canning business, and one which has been no doubt a mystery to most people. In nearly all vegetables there are certain acids entirely different from the ferment germs from the fact that they will not cause fermentation, but if they are not removed, will cause the contents of the can to digest itself, or, in other words, become musty or unpalatable. For this the so-called blanching or parboiling is required. It consists in giving the vegetables a short boiling or dipping in hot water before placing in the cans, thus removing this destructive acid. Briefly, the spoiling of



LOCATIONS OF THE RESERVE BANKS.

food stuffs is caused by germs and spores, which multiply rapidly, causing fermentation, which very quickly makes the goods unfit and dangerous to eat. Clear water in an open kettle cannot be heated higher than 212 Fahr., no matter how hot the fire. It will simply form steam and evaporate. Some of the germs or spores are not killed at this heat, even after eight or 10 hours' continuous boiling. Steam under pressure raises the heat to a much higher degree, penetrating every particle of the contents of the can, thus thoroughly sterilizing them.

FURTHER CONSIDERATIONS.—Some vegetables contain acid which must be got rid of before placing in the cans. Certain food stuffs are very readily sterilized. All the different varieties of fruits and tomatoes are easily sterilized. Lima beans, string beans, corn, pumpkins, fish and meats are more difficult to sterilize. Any boiler in which the steam pressure can be raised to 15 pounds to the square inch will make a successful canning apparatus. On the other hand, any contrivance which is not steamtight and strong enough to stand the pressure will prove a failure. Boiling water is not hot enough. The cans containing the food stuffs must actually be placed inside the boiler, and the steam raised to the right pressure for that particular kind, and for a sufficient length of time to destroy the bacillus. All foods except fruit must be cooked in the can or jars, and not exposed to the air after sterilizing. Germs if not all killed, cause the cans to bulge and burst by forming a gas. These are called swells, and have to be thrown out. When food in the can is hot it is very much expanded, and when cooled forms a vacuum, and draws in the ends of the tin can if tight, thus denoting that the contents are in good condition.

EXTENT OF THE INDUSTRY.—It is impossible to estimate the amount of food stuffs canned at home and on the farm, but most of this is consumed by those who put it up, and is a different thing from commercial canning at home. The consumption of canned goods is increasing about 20 per cent. annually. During the season of 1913 there were about thirty million dozen cans of tomatoes, fifteen million dozen cans of corn, and other things in proportion packed by commercial factories. There are about 4,000 of these factories operating in this country, 99 per cent. of which use steam under pressure. Large quantities of these goods are of poor quality, owing to carelessness or greed of the owners, who do not take quality into consideration nearly as much as they do quantity, which have to be sold at a loss. Goods canned where produced and fresh from the trees or vines must naturally be of better quality and flavor. In addition, sanitary conditions can be better controlled by the individual canner than by the large factory where hundreds of laborers are employed. But it must be remembered that the factories have the advantage of improved machinery, and unless the home canned goods are of better quality, "home canning" on a commercial scale cannot compete with the factory output. WM. H. PARSIL.

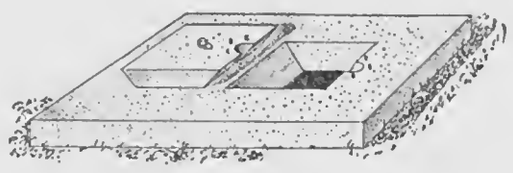
Middlesex Co., N. J.

WAR UPON THE ENGLISH SPARROW.

Can you give me some information about the English sparrow? Is it a fact that they keep all songbirds away, and that they are not insectivorous? I have read that they were most harmful to small country places for both those reasons. I have also read that the best way to rid the place of them was to soak wheat in whiskey and let them feed on it, and they would soon become helpless and could be gathered up and separated from the other birds, if any other kind shared their meal, and in that way the undesirable sparrow could be eliminated. If this could be done, how could one be sure of the English sparrow—I mean anyone who does not know an English sparrow from the snowbird or song sparrow? Have they any particular markings whereby one could distinguish them? There are hundreds of small birds on my small place that eat with the chickens all the time, and while I am glad to give a hungry bird feed I do not want the bluebirds and song sparrows driven away. E. M.

New York.

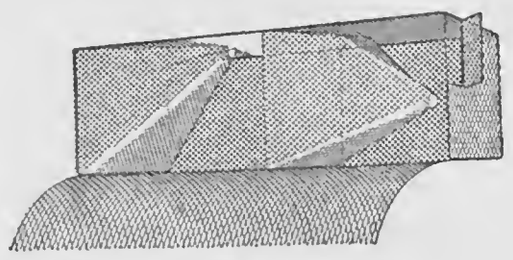
I doubt very much whether whiskey-soaked grain would ever be very useful in catching the English sparrow. He has been intimately associated with human beings during the past several thousand years, and has gradually accumulated much wisdom. It is probable that when individuals showed the slightest signs of intoxication the associates would become suspicious and refuse to take any more of the bait. In spreading poison we always endeavor to operate when the birds are hungry, so that the majority may partake of the poison dose before the symptoms become evident; otherwise as soon as one of the birds begins to act strangely the rest of the flock will stop feeding and thus escape permanent injury. I am sending you a copy of our bulletin on the "English Sparrow as a Pest." On pages 17 to 20 you will find described a funnel trap which was perfected in this Bureau (see (Fig. 247). With three of these traps we were able practically to exterminate the sparrows from the Agricultural



FUNNEL SPARROW TRAP. FIG. 247.

grounds in Washington three or four years ago. Up to the present time they have not regained more than 25 per cent. of their original abundance. This trap can be easily and economically made. It has the advantage that any native species may be liberated. In Fig. 250 is a very good illustration of the male and female sparrow, which should be of assistance to the novice in identifying the species.

Around farm buildings or chicken houses, where sparrows congregate in a large flock during the Winter, they may be easily captured by means of a sieve trap, as figured in Fig. 248. The sieve should be propped up for a week or more so that the birds may become perfectly familiar with it. A morning after a snowstorm should be chosen for trapping. The hungry birds may be easily captured by pulling away the prop as they are crowded together



SIEVE SPARROW TRAP. FIG. 248.

feeding upon the bait. Before operating the snow should be carefully swept away and the ground leveled so that the trap will fall evenly upon the ground. The sparrows may be driven through a little slide door in the back into a receiving box similar to the one shown in Fig. 247. I shall be glad to describe any further details that may not be quite clear to you. A. K. FISHER.

THE FARMER AND THE STOREKEEPER.

The articles in THE R. N.-Y. of March 14 suggest a matter which is of great public importance, viz.: the relation of the farmers and country dwellers to the catalogue houses and small dealers. Dealers' organizations in different lines have within the last few weeks been holding annual conventions, and one of the chief subjects of discussion and resolution has been as to how they can circumvent the catalogue houses and compel farmers to buy from the local merchants. Congress and the Postoffice Department have been memorialized and implored and besieged in an effort to get the parcel post so regulated that trade with the catalogue houses shall not be facilitated by this means and in every way such trade is made as difficult as possible. On page 402 F. A. C. of Missouri calls attention to some unnecessary expenses attached to the business of local merchants, and on the first page Daniel N. Pomeroy relates an instance where a Grange in New York was able to effect a saving of 40% in the purchase of a carload of drain tile. Are dealers justified in their actions, and are Granges justified in trading elsewhere?

Now, in this controversy between the farmers and the local merchants and small dealers over this matter, it is important that the question of equity should be clearly understood. If the contention of the dealers is correct, and if the farmers are under any manner or kind of obligations, either legal, moral or economic, to patronize only their local dealers, and entirely withhold trade from the catalogue people, we all want to know it; for surely the farmers who believe in justice and fair play would not wish to do any injustice to anybody in such matters. These relations have already reached a strained condition. When local dealers do not hesitate to express contempt for those who buy from catalogue houses, as they do, and when the dealers' organizations publicly adopt resolutions in opposition to all such transactions, the question of moral status should be admitted and recognized. In every town and hamlet and country place, as well as in the cities, there are poor men supporting their families with their bare hands, and it is imperative that these men should make every dollar count to the uttermost, and they do not wish that odium should be cast upon them because, forsooth, they elect to trade where they can get the most for their money. For it goes without saying that catalogue prices are materially lower than those of local dealers. What is the right and wrong of the case, therefore? Merchants and dealers of every class claim the undisputed right to trade wherever they please, and spend their money as they like. Have the farmers and country dwellers the same prerogative, or have they not? The question answers itself.

No matter how small the town nor how many dealers in a given line it may contain, every man who finds himself up against the world for a living, and who can scrape together enough means or credit to buy a hatful of goods may start up in business, and by the mere fact of his having elected to do so seems to regard himself as entitled to a share of the town's patronage, and is ready to join in the general chorus, "Trade at home," "Support home institutions," etc., and to cast contempt on those who choose to send away from home for their goods instead of paying him a round profit for doing this for them. Nor does he scruple to throw every obstacle in the way of others trading elsewhere, nor does he hesitate about joining the dealers' organization in asking for laws that shall curtail these rights and privileges as much as possible. There is no occasion for quarrel between dealers and farmers, and when dealers are willing to recognize the rights of others the utmost friendship may prevail. E. H.

Michigan.

A DIFFERENCE IN OAT RUST.

An uncle of mine in Delaware County, New York, 1,500 feet above sea level, told me that he once sowed oats on both sides of a small brook running through the farm, and that the oats on the side with the northern slope rusted badly, while those on the side sloping south did not rust at all. The brook could be stepped across anywhere without wetting the feet, and the land sloped sharply upward on each side, there being no flat. I have often wondered what could be the explanation of this.

Washington, D. C. C. W. B.

Of course, it is impossible to do anything more than give a guess in a case of this kind. It would be hard to account for the marked difference which is said to have occurred in the oats. If a scientist could visit the field while the oats were growing, and take samples for examination, and also study all the conditions, he could give a much better reply. Prof. F. C. Stewart of the Geneva Experiment Station says that if the oats sown on different sides of the creek were of different varieties, this fact might account for the appearance of the disease. Some varieties of oats are much more susceptible to rust than are others. Again, if the oats on different sides of the stream were sown at different times, that might be an explanation of the trouble. It seems that late-sown oats are much more liable to rust than those which are seeded earlier. If the oats on both sides of the stream were exactly the same in variety, selection, and time of sowing, in fact, if all the conditions were alike, there is only one guess to be made at the trouble. It may be that the oats on the north slope were shaded longer in the day, and thus the foliage was kept moist with the dew, and also after rains longer than the oats on the other side. The increase of moisture on the oats would have a tendency to increase the trouble from rust, but, of course, not knowing anything further about the case, it is difficult to give any exact opinion about it. Such differences do occur, and it is frequently almost impossible to figure out the cause.

ALFALFA IN JEFFERSON COUNTY, N. Y.

According to the census of 1890 there was no Alfalfa growing in Jefferson County. The census of 1900 reported four acres, and that of 1910 reported 244 acres. Since 1910 the acreage has increased to some extent. Alfalfa growing in Jefferson County has never given promise of wonderful results. Three seasons seem to be about as long a period, on the average, as the stands of this crop will return satisfactory yields. Many fields do not last longer than two seasons, and as a general rule two crops only are secured. Where the third cutting is made the plants are obliged to go into Winter with very little protection.

As a general thing the soil conditions in the county are unfavorable (undrained heavy clay), though there are some local soil areas of gravel. Many who have tried to grow this crop have met wih partial or complete faliure. While the majority of failures have been due to a disregard to the necessity of liming the soil, inoculating the seed, properly fitting the soil and time of sowing, some have failed after carefully observing all precautions. Open Winters with sleet or ice storms have proven most harmful as regards weather conditions to the Alfalfa crop. Many who have tried the crop in Jefferson County, and have watched others, are by no means optimistic concerning the future of Alfalfa. There are many instances on record where the crop has failed after every possible precaution concerning its growth has been observed.

Some field trials are being made wtih two of the so-called hardy varieties, namely, Grimm and Turkestan Alfalfas. Of the former there are now eight acres growing in the county; of the latter about one acre. What success these two varieties will make remains to be seen. They are now passing through their second Winter. The Grim Alfalfa differs from the common Alfalfa chiefly in respect to its root growth (see Fig. 249, which is decidedly branching in contrast to the long tap-root of the common sort. Whether this type of root will enable the plants to withstand any better the heaving action of the soil is a question that remains to be proven. The foliage of the two varieties differs only slightly, the leaves of the Grimm variety being slightly less lanceolate than the common Alfalfa.
